*Dedicated to all  
past and present contributors  
and  
supporters of Toronto Notes  
who have made the production of the 30th Anniversary Edition possible!*

The Toronto Notes is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto's Faculty of Medicine. Programs that have received Toronto Notes funding include:

**Community Affairs Projects**

- Saturday Program for Inner City High School and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
- Let's Talk Science
- Growing Up Healthy

**Annual Faculty Showcase Events**

- Bruce Tovee Lecture Series
- Daffydil, in support of the Canadian Cancer Society
- Earthtones Benefit Concert
- Convocation and Ceremonies
- Clerkship Luncheon

**Medical School Clubs**

- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

**Scholarships and Bursaries**

- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

**NOTE:**

Many of you have wondered about the *Toronto Notes* logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius' healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O'Brien, MD  
Class of 2009  
M.D. Program, University of Toronto

# Preface – From the Editors

Dear Readers,

As Editors-In-Chief of *Toronto Notes* 2014, we are proud to celebrate the 30th Anniversary Edition of the present text.

First produced in 1983 from a set of study notes drafted by medical students at the University of Toronto, *Toronto Notes* has grown to be one of the premier study resources for generations of medical graduates in Canada and abroad. This rich history is rooted in our commitment to publish a student-edited, comprehensive study resource to serve students across clinical rotations and in preparation for the Canadian Medical Licensing Examination (Step 1) and the United States Medical Licensing Examination (Step 2).

Over the past 29 years, our vision has not wavered. We continuously build on the feedback of our readers to enhance the features of the text, handbook and accompanying online resources. The focus of *Toronto Notes* 2014 is to make medical knowledge accessible and retainable by distilling information into high-quality figures, charts and helpful mnemonics. This edition features a new easy-to-view layout across all 29 chapters, with updated text-referencing icons and illustrations. In keeping with rapid advances in medical research, the text also features newly updated best practice guidelines, including recent high-impact trials for clinical practice. The accompanying *Toronto Notes Handbook* also offers new algorithms, flow-charts and new reference cards to serve as a high-yield and portable resource across clinical rotations. This year we are also excited to announce the launch of the first colour edition of the *Toronto Notes eBook* to offer our readers an enhanced mobile learning experience.

*Toronto Notes* 2014 is produced by Toronto Notes for Medical Students Inc., a non-for profit organization supporting various medical student initiatives including community outreach programs, medical school clubs, local charity endeavors, and student bursaries. This year we are especially proud to support the Nishant Fozdar Memorial Award. Nishant was an exceptional medical student, colleague and dear friend in the University of Toronto medical class of 2014. This annual award was established in

his memory, and will be awarded to University of Toronto students who demonstrate Nishant's many qualities, including his dedication to education and community involvement.

Throughout the production of this edition, we have benefited from the gracious help of our student colleagues as well as numerous faculty and administrators at the University of Toronto Faculty of Medicine. Our dedicated team of over 150 students, artists and faculty editors remain the cornerstone of *Toronto Notes* and continue to enhance the text in its' content and clarity each year. We are grateful for our lead editors Andy Tyrell, Vicki Wang, Maria Jogova, Howard Meng, Grace Lam, Hamed Nazzari, Jieun Kim, Daniel Soong, Melini Gupta, Jeffrey Martin and Gautam Goel as well as our 2014 production managers Sheron Perera and Bailey Dyck for their tireless work and dedication to this project. We would also like to acknowledge our partners at Type & Graphics, particularly Enrica Aguilera, for their continued guidance in the production of this text. We also thank our immensely talented cover artists Karyn Ho and Catherine Kang for their innovative vision and immaculate execution of the featured mosaic cover illustration.

Finally we would like to express our deepest gratitude to all previous Editors-In-Chief of *Toronto Notes*. Each editorial team left their unique mark on the text and helped *Toronto Notes* grow into one of the most recognizable student publications in Canada. Much like the pieces in a mosaic, the product of these countless contributions have formed the 30th Anniversary Edition before us today.

On behalf of the 2014 editorial team, we wish you the best in your studies and hope that you will find *Toronto Notes* 2014 to be an asset to your success.

Sincerely,

Miliana Vojvodic, MSc and Ann Young, PhD  
Editors-In-Chief, *Toronto Notes* 2014  
MD Program, University of Toronto

# Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 30th edition of this text was made possible with their contributions.

# How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of *Toronto Notes 2014* allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

Icon	Icon Name	Significance
	Key Objectives	This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.
	Clinical Pearl	This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.
	Memory Aid	This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.
	Clinical Flag	This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.
	Cross-Reference	This icon is found in sidebars of the text. It indicates a cross-reference for information that is discussed in a separate chapter.
	Evidence Based Medicine	This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text.
	Colour Photo Atlas	This icon is found next to headings in the text. It indicates topics that correspond with images found in the Colour Photo Atlas available online. ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).
	Radiology Atlas	This icon is found next to headings in the text. Indicates topics that correspond to images found in the Radiology Atlas available online. ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> )
	Online Resources	This icon is found next to headings in the text. It indicates topics that correspond with electronic resources such as Functional Neuroanatomy or ECGs Made Simple, available online. ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> )

## Chapter Divisions

To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

### Basic Anatomy/Physiology Review

- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

### Common Differential Diagnoses

- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

### Diagnoses

- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

### Common Medications

- a quick reference section for review of medications commonly prescribed

# Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor

To convert from the SI unit to the conventional unit, **divide** by conversion factor

	Conventional Unit	Conversion Factor	SI Unit
ACTH	pg/mL	0.22	pmol/L
Albumin	g/dL	10	g/L

Further information on these topics can be found in the *Objectives of the Considerations of the Legal, Ethical and Organizational Aspects of the Practice of Medicine (CLEO)* – which can be downloaded free of charge from the Medical Council of Canada website at <http://mcc.ca/wp-content/uploads/CLEO.pdf>

Canadian law applicable to medical practice varies between jurisdictions and changes over time. Criminal law is nationwide, but non-criminal (civil) law varies between provinces. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

## Acronyms

AE	adverse event	CPSO	College of Physicians and Surgeons of Ontario	PIPEDA	Personal Information Protection and Electronic Documents Act
AMA	American Medical Association	HCCA	Health Care Consent Act	POA	power of attorney
ART	advanced reproductive technologies	LMCC	Licentiate of the Medical Council of Canada	SDM	substitute decision maker
CCB	Consent and Capacity Board	MCC	Medical Council of Canada		
CMA	Canadian Medical Association	OECD	Organization for Economic Co-operation and Development		
CMPA	Canadian Medical Protective Association				

# Legal Framework

## Sources of Law

Source of Law	Definition	Example
<b>Common Law</b>	Legal rules and principles that define private rights and obligations	Tort Law: defines breaches of civil duty owed to someone else Contract Law: define mutually agreed upon rights and obligations that may result in award of damages if breached
<b>Statutes</b>	Laws passed by provincial legislatures and the federal parliament Basis of province/territory specific health care acts Used to establish the provincial/territorial Licensing and Regulatory Authority for health care professionals	In Ontario: <i>Health Care Consent Act</i> , <i>Personal Information Protection Act</i> Criminal Code of Canada which defines breaches of duty owed to society in general
<b>Constitution</b>	Supreme law of Canada All other laws must be consistent with constitution	Canadian Charter of Rights and Freedoms is part of the constitution and guarantees the rights of life, liberty, security of the person, and equality under the law

### Categories of Health Law and Policy

- **Private:** regulates the relationship between "private" actors, such as Doctor and Patient
- **Public:** regulates the actions of "public" actors such as the provincial and federal governments

# Ethical Framework

## Principles of Ethics

- ethics addresses:
  - 1) the principles and values that help define what is morally right and wrong
  - 2) the rights, duties and obligations of individuals and groups
- the practice of medicine assumes there is one code of *professional* ethics for all doctors and that they will be held accountable by that code and its implications

**Table 1. The Four Principles Approach to Medical Ethics**

Principle	Definition	In Practice Do's	In Practice Don'ts
<b>Autonomy</b>	<ul style="list-style-type: none"> <li>• Recognizes an individual's right and ability to decide for themselves according to his/her beliefs and values</li> <li>• Not applicable to newborns, young children, or in situations where informed consent and choice are not possible or may not be appropriate</li> </ul>	<ul style="list-style-type: none"> <li>• Respect and promote an individual patient's values and preferences in decision making to empower him or her</li> <li>• Understand, appreciate, and respect a patient's decision even if it may differ from the recommendation of the physician</li> <li>• Show fidelity to incapable patient's prior capable views if known, and treat them with worth and dignity</li> </ul>	<ul style="list-style-type: none"> <li>• Doctors are not obliged, and indeed ought not, to comply with patients wishes that are illegal or might be considered to be 'conduct unbecoming a doctor' (unprofessional conduct, falling below the standard of care)</li> <li>• A patient's autonomy may be compromised by illness; the principle of autonomy is not a trump card and must be balanced by the rest of the listed principles</li> <li>• Patients are not expected to act in ways considered 'reasonable' or rational by others as long as they do not harm others</li> </ul>

### Autonomy vs. Competence

**Autonomy:** the right that patients have to make decisions according to their beliefs and preferences.

**Competence:** the ability or capacity to make a specific decision for oneself.

**Table 1. The Four Principles Approach to Medical Ethics** (continued)

Principle	Definition	In Practice Do's	In Practice Don'ts
<b>Beneficence</b>	<ul style="list-style-type: none"> <li>The patient-based 'best interests' standard that combines doing good, avoiding harm, taking into account the patient's values, beliefs, and preferences, so far as these are known</li> <li>Autonomy should be integrated with the physician's conception of a patient's medically-defined best interests</li> <li>The aim is to minimize harmful outcomes and maximize beneficial ones</li> <li>Paramount in situations where consent/choice is not possible or may not be appropriate</li> </ul>	<ul style="list-style-type: none"> <li>Try to ensure that a treatment's benefits outweigh its burdens</li> <li>Recommend treatment based on evidence and professional experience to patients and help them weigh the risks and benefits of various options</li> <li>Where a patient's capacity is compromised, physicians have more authority to act purely in the patient's best interests as defined by the therapeutic relationship but they still ought to do so in ways informed by the patient's known wishes and with the involvement, where possible, of the patient's substitute decision-maker</li> </ul>	<ul style="list-style-type: none"> <li>Do not make a decision without a patient's input (direct or indirect)</li> </ul>
<b>Non-Maleficence</b>	<ul style="list-style-type: none"> <li>Obligation to avoid causing harm; <i>primum non nocere</i> ("First, do no harm")</li> <li>A limit condition of the Beneficence principle</li> </ul>	<ul style="list-style-type: none"> <li>Efforts should be made to reduce error and adverse events and ensure patient safety</li> <li>A key guide for all management plans</li> </ul>	<ul style="list-style-type: none"> <li>Do not recommend a treatment because it will have some harm associated with it</li> </ul>
<b>Justice</b>	<ul style="list-style-type: none"> <li>Fair distribution of benefits and harms within a community, regardless of geography or privilege</li> <li>Concept of fairness: Is the patient receiving what he/she deserves – his/her fair share? Is he/she treated the same as equally situated patients? How do one set of treatment decisions impact on others?</li> <li>Respects rules of fair play and basic human rights, such as freedom from persecution and the right to have one's interests considered and respected</li> </ul>	<ul style="list-style-type: none"> <li>Scarce resources are distributed based on the needs of patients and the benefit they would receive from obtaining a specific resource e.g. organs for transplantation are fairly distributed if they go to those who are the most unwell, who are the most likely to survive the longest with the transplant, and who have waited the longest to receive a transplant</li> </ul>	<ul style="list-style-type: none"> <li>Physicians ought to be 'door openers', not 'gate-closers', for their patients</li> </ul>

**The Canadian Adverse Events Study: The Incidence of Adverse Events among Hospital Patients in Canada**
*CMAJ* 2004;170:1678-1686

**Study:** Hospital charts randomly selected and reviewed in four randomly selected Canadian hospitals for the fiscal year 2000.

**Patients:** 4174 patient charts sampled, 3745 eligible charts (>18 yr of age; nonpsychiatric, nonobstetric, minimum 24 h admission).

**Results:** AE rate was 7.5% per 100 hospital admissions (95% CI 5.7-9.3). Highly preventable AEs occurred in 36.9% of patients with AEs (95% CI 32.0-41.8%) and death occurred in 20.8% (95% CI 7.8%-33.8%). An estimated 1521 additional hospital days were associated with AEs. Patients with AEs were significantly older than those without (mean age [and standard deviation] 64.9 [16.7] v. 62.0 [18.4] yr;  $p=0.016$ ). Men and women experienced equal rates of AEs.

**Conclusions:** The overall incidence rate of AEs of 7.5% suggests that, of the almost 2.5 million annual hospital admissions in Canada similar to the type studied, about 185 000 are associated with an AE and close to 70 000 of these are potentially preventable.

**Adverse Event (AE)**

An unintended injury or complication from health care management resulting in disability, death or prolonged hospital stay.

The CMA Code of Ethics is a quasi-legal standard for physicians. If the law sets a minimal moral standard for doctors, the Code ratchets up these standards.

## Code of Ethics

- CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - based on the fundamental ethical principles of medicine
  - sources include the Hippocratic Oath, developments in human rights, recent bioethical discussion
  - statements are general in nature
  - CMA policy statements address specific ethical issues not mentioned by the code (e.g. abortion, transplantation, and euthanasia)
- the American Medical Association (AMA) has a Code of Medical Ethics
  - articulates the values of medicine as a profession and defines medicine's integrity
  - source of the profession's authority to self-regulate
  - evolving document that changes as new questions arise; AMA policy positions ("AMA Policy") address current health care issues, the health care system, internal organizational structure, decision-making processes, and medical science and technology

# Specific Issues in Private Health Law and Ethics

## Doctor-Patient Relationship

Ethical Basis	Legal Basis
<ul style="list-style-type: none"> <li>A partnership based on the physician providing expert opinion, information, options, and interventions that allows the patient to make informed choices about his/her health care</li> <li>Within this relationship, the doctor and patient share the goals of positive health outcomes, good communication, honesty, flexibility, sensitivity, informed consent, and respect</li> <li>This relationship has the potential to be unequal due to a power difference <ul style="list-style-type: none"> <li>Patients are ill and lack medical expertise</li> <li>Physicians possess specialized medical knowledge and skills</li> <li>Physicians are in a fiduciary relationship with their patients</li> </ul> </li> <li>Due to the nature of the doctor-patient relationship, the physician will: <ul style="list-style-type: none"> <li>Place the best interests of the patient first</li> <li>Establish a relationship of trust with the patient</li> <li>Follow through on undertakings made to the patient in good faith</li> </ul> </li> <li>The physician will accept or refuse patients requesting care: <ul style="list-style-type: none"> <li>Without consideration of race, gender, age, sexual orientation, financial means, religion or nationality</li> <li>Without arbitrary exclusion of any particular group of patients, such as those known to be difficult or afflicted with serious disease</li> <li>Except in emergency situations, in which case care must be rendered</li> </ul> </li> <li>Once having accepted a patient into care, the physician may terminate the relationship provided: <ul style="list-style-type: none"> <li>It is not an emergency</li> <li>After a reasonable period of time (usually a month) for the patient to find alternate care</li> <li>Adequate notice (usually an explanatory letter by registered mail) has been given to the patient</li> <li>There are other options to find 'medically necessary care' (in other words, in smaller communities with fewer options for care, there may need to be some flexibility in cessation of care)</li> </ul> </li> <li>The reason for termination ought to be 'failure of trust'</li> <li>The physician will not exploit the doctor-patient relationship for personal advantage – for sexual, financial, academic or other purposes</li> <li>The physician will disclose limitations to the patient where personal beliefs or inclinations limit the treatment the physician is able to offer</li> <li>The physician will maintain and respect professional boundaries at all times <ul style="list-style-type: none"> <li>Including physical, emotional, and sexual boundaries</li> <li>Regarding treatment of themselves, their families, and friends</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Duties and rights defined partly by: <ul style="list-style-type: none"> <li>Tort law that allows patients to recover damages for wrongful acts committed against them; the most important are: <ol style="list-style-type: none"> <li>Negligence: breach of a legal duty of care (in tort) which results in damage <ul style="list-style-type: none"> <li>Legal finding, not a medical one</li> <li>Physicians may be found negligent when the following four conditions are met: <ol style="list-style-type: none"> <li>The physician owed a duty of care to the patient (the existence of a doctor-patient relationship generally suffices)</li> <li>The duty of care was breached (e.g. by failure to provide the standard of care) <ul style="list-style-type: none"> <li>The standard of care is one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, and specialization</li> </ul> </li> <li>The patient was injured or harmed</li> <li>The harm or injury was caused by the breach of the duty of care</li> </ol> </li> </ul> </li> <li>Errors of judgment are not necessarily negligent</li> <li>Making the wrong diagnosis is not negligent if a reasonable doctor might have made the same mistake in the same circumstances</li> <li>Failure to reconsider the diagnosis if the patient does not respond to treatment may be negligent</li> <li>Physicians can be held liable for the negligent actions of their employees or other individuals they are supervising</li> </ol></li></ul> </li> <li>B. Battery: the application of force to a person's body without their consent <ul style="list-style-type: none"> <li>Contractual rights and obligations that if breached may result in the award of damages</li> <li>Fiduciary duty of physicians to their patients (i.e. to act in their best interest)</li> </ul> </li> </ul>

In situations in which it would be more difficult for a patient to find alternate "medically necessary care", the physician may need to exhibit some flexibility in cessation of care.

"Failure of trust" situations include "double-doctoring" on the part of the patient and patient threats of violence.

### CPSO Policy: Treating Self and Family Members

Physicians will not diagnose or treat themselves or family members except for minor conditions or in emergencies and then only if no other physician is readily available.

### CPSO Policy: Ending the Physician-Patient Relationship

Discontinuing services that are needed is an act of professional misconduct unless done by patient request, alternative services are arranged, or adequate notice has been given.

### Dealing with Controversial and Ethical Issues in Practice

- Discuss in a non-judgmental manner
- Ensure patients have full access to relevant and necessary information
- Identify if certain options lie outside of your moral boundaries and refer to another physician if appropriate
- Consult with appropriate ethics committees or boards
- Protect freedom of moral choice for students or trainees

Source: MCC-CLEO Objectives 1998

## Consent and Capacity

- the autonomous authorization of a medical intervention by a patient
- applies to acceptance and refusal of treatment

### Ethical Principles Underlying Consent and Capacity

- usually the principle of respect for patient autonomy overrides the principle of beneficence
- where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding the patient's values, beliefs, and cultural or religious background
- more recently expressed wishes take priority over remote ones
- patient wishes may be verbal or written
- patients found incapable to make a specific decision should still be involved in that decision as much as possible
- agreement or disagreement with medical advice does not determine findings of capacity/incapacity
- however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed

#### CPSO Policy Consent

Obtaining valid consent before carrying out medical, therapeutic and diagnostic procedures has long been recognized as an elementary step in fulfilling the doctor's obligations to the patient.

## Consent

### Obtaining Legal Consent

- consent of the patient must be obtained before any medical intervention is provided; consent can be:
  - verbal or written, although written is usually preferred
    - ♦ a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent (see Figure 1)
    - ♦ what matters is what the patient understands and appreciates, not what the signed consent form states
  - implied (e.g. a patient holding out their arm for an immunization) or expressed
- consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm
- *Health Care Consent Act* (of Ontario) covers consent to treatment, admission to a facility, and personal assistance services (e.g. home care)

### Four Basic Requirements of Valid Consent

#### 1. Voluntary

- consent must be given free of coercion or pressure (e.g. from parents or other family members who might exert 'undue influence')
- the physician must not deliberately mislead the patient about the proposed treatment

#### 2. Capable

- the patient must be able to understand and appreciate the nature and effect of the proposed treatment

#### 3. Specific

- the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (i.e. the patient must be informed if students will be involved in providing the treatment)

#### 4. Informed

- sufficient information and time must be provided to allow the patient to make choices in accordance with their wishes. This information should include:
  - ♦ the nature of the treatment or investigation proposed and its expected effects
  - ♦ all significant risks and special or unusual risks
  - ♦ alternative treatments or investigations and their anticipated effects and significant risks
  - ♦ the consequences of declining treatment
  - ♦ risks that are common sense need not be disclosed (i.e. bruising after venipuncture)
  - ♦ answers to any questions the patient may have
- the reasonable person test – the physician must provide all information that would be needed "by a reasonable person in the patient's position" to be able to make a decision
- disclose common adverse events (>1/200 chance of occurrence) and serious risks (e.g. death) even if remote
- it is the physician's responsibility to make reasonable attempts to ensure that the patient understands the information
- physicians should not withhold information about a legitimate therapeutic option based on personal conscience (e.g. not discussing the option of emergency contraception)

#### 4 Basic Elements of Consent

- Voluntary
- Capable
- Specific
- Informed

The Supreme Court of Canada expects physicians to disclose the risks that a "reasonable" person would want to know. In practice, this means disclosing minor risks that are common as well as serious risks that happen infrequently, especially those risks that are particularly relevant to a particular patient (e.g. hearing loss for a musician).

## Exceptions to Consent

### 1. Emergencies

- treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their substitute decision maker (SDM)
- emergency treatment should not violate a prior expressed wish of the patient (e.g. a signed Jehovah's Witness card)
- if patient is incapable, MD must document reasons for incapacity and why situation is emergent
- patients have a right to challenge a finding of incapacity as it removes their decision-making ability
- if a SDM is not available, MD can treat without consent until the SDM is available or the situation is no longer emergent

### 2. Legislation

- Mental Health legislation allows for:
  - ♦ the detention of patients without their consent
  - ♦ psychiatric outpatients may be required to adhere to a care plan in accordance with Community Treatment Orders (see [Psychiatry](#), PS7)
- Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases (see [Population Health and Epidemiology](#), PH19)

### 3. Special Situations

- public health emergencies (e.g. an epidemic or communicable disease treatment)
- warrant for information by police

## Consequences of Failure to Obtain Valid Consent

- treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in exceptions section above)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

### Major Exceptions to Consent

- Emergencies
- Communicable diseases
- Mental Health legislation

Administration of treatment for an incapable patient in an emergency situation is applicable if the patient is:

- Experiencing extreme suffering
- At risk of sustaining serious bodily harm if treatment is not administered promptly

Patients may also ask to waive the right to choice (e.g. "You know what's best for me, doctor") or delegate their right to choose to someone else (e.g. a family member).

### Consent

- Treatment without consent = battery, including if NO consent or if WRONG procedure
- Treatment with poor or invalid consent = negligence

### CPSO Policy on Capacity

Capacity is an essential component of valid consent, and obtaining valid consent is a policy of the CMA and other professional bodies.

## Capacity

- capacity is the ability to:
  - understand information relevant to a treatment decision
  - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
- capacity is specific for each decision (e.g. a person may be capable to consent to having a chest x-ray, but not for a bronchoscopy)
- capacity can change over time (e.g. temporary incapacity secondary to delirium)
- most Canadian jurisdictions distinguish capacity to make health care decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
- a person is presumed capable unless there is good evidence to the contrary
- capable patients are entitled to make their own decisions
- capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny
- capacity assessments must be conducted by a physician and, if appropriate, in consultation with other health care professionals (e.g. another physician, a mental health nurse)
- clinical capacity assessment may include:
  - specific capacity assessment (i.e. capacity specific to the decision at hand)
    1. effective disclosure of information and evaluation of patient's reason for decision
    2. understanding of:
      - his/her condition
      - the nature of the proposed treatment
      - alternatives to the treatment
      - the consequences of accepting and rejecting the treatment
      - the risks and benefits of the various options (test: can the patient recite back what you have disclosed?)
    3. for the appreciation needed for decision making capacity, a person must:
      - acknowledge the condition that affects him/herself
      - be able to assess how the various options would affect him or her
      - be able to reach a decision and adhere to it, and make a choice, not based primarily upon delusional belief (test: are their beliefs responsive to evidence?)
  - general impressions
  - input from psychiatrists, neurologists, etc.
- employ "Aid to Capacity Evaluation" (see Table 2)

**Table 2. Aid to Capacity Evaluation**

Ability to understand the medical problem
Ability to understand the proposed treatment
Ability to understand the alternatives (if any) to the proposed treatment
Ability to understand the option of refusing treatment or of it being withheld or withdrawn
Ability to appreciate the reasonably foreseeable consequences of accepting the proposed treatment
Ability to appreciate the reasonably foreseeable consequences of refusing the proposed treatment
Ability to make a decision that is not substantially based on delusions or depression

Adapted from Etchells, et al. 1996

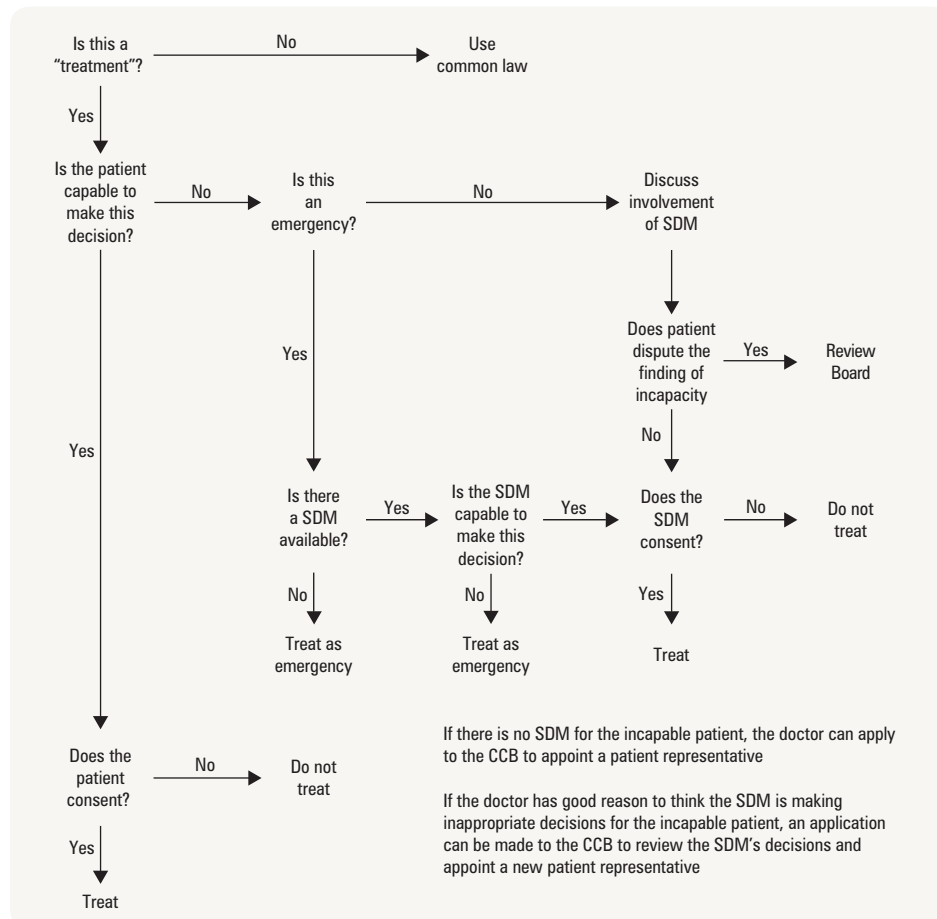

- a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board), or the courts
- judicial review is open to patients if found incapable

**Treatment of the Incapable Patient in a Non-Emergent Situation**

- obtain informed consent from SDM
- an incapable patient can only be detained against his/her will to receive treatment if he/she meets criteria for certification under the *Mental Health Act*. In such a situation:
  - document assessment in chart
  - notify patient of assessment using appropriate Mental Health Form(s) (Form 42 in Ontario)
  - notify Rights Advisor

**SUBSTITUTE DECISION MAKERS (SDMs)**

- SDM must follow the following principles when giving informed consent:
  - act in accordance with wishes previously expressed by the patient while capable
  - if wishes unknown, act in the patient's best interest, taking the following into account:
    1. values and beliefs held by the patient while capable
    2. whether well-being is likely to improve with vs. without treatment
    3. whether the expected benefit outweighs the risk of harm
    4. whether a less intrusive treatment would be as beneficial as the one proposed
  - the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM is not abiding by the above principles

**Figure 1. Ontario consent flowchart**

SDM = substitute decision maker

Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

Most provinces have legislated hierarchies for SDMs; the hierarchy in Ontario is:

- Legally appointed guardian
- Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see *Powers of Attorney*, ELOAM8)
- Representative appointed by the Consent and Capacity Board
- Spouse or partner
- Child (age 16 or older) or parent (unless the parent has only a right of access)
- Parent with only a right of access
- Sibling
- Other relative(s)
- Public guardian and trustee

## INSTRUCTIONAL ADVANCE DIRECTIVES

- allow patients to exert control over their care once they are no longer capable
- the patient sets out their decisions about future health care, including who they would allow to make treatment decisions on their behalf and what types of interventions they would want
- takes effect once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a power of attorney for personal care to carry out his/her advance directives
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they are current with their wishes

## POWERS OF ATTORNEY

- all Guardians and Attorneys have fiduciary duties for the dependent person

### Definitions

- **Power of Attorney for Personal Care**
  - a legal document in which one person gives another the authority to make personal care decisions (health care, nutrition, shelter, clothing, hygiene, safety) on their behalf if they become mentally incapable
- **Guardian of the Person**
  - someone who is appointed by the Court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care
- **Continuing Power of Attorney for Property**
  - a legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions
- **Guardian of Property**
  - someone who is appointed by the Public Guardian and Trustee or the Courts to look after an incapable person's property or finances
- **Public Guardian and Trustee**
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf
- **Pediatric Aspects of Capacity Covered by the HCCA, Ontario**
  - no age of consent; consent depends on patient's decision-making capacity
  - QC has a specific age of consent, but common law and case law deem underage legal minors capable, allowing them to make their own choices; all other provinces and territories do not have an age of consent
  - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved (i.e. be provided with information appropriate to their comprehension level)
  - adolescents are usually treated as adults
  - preferably, assent should still be obtained from patient, even if not capable of giving consent
  - in the event that the physician believes the SDM is not acting in the child's best interest, an appeal must be made to the local child welfare authorities
  - under normal circumstances, parents have right of access to the child's medical record

There is no age of consent in Ontario.

### Other Types of Capacity Not Covered by the HCCA

- Testamentary (ability to make a will)
- Fitness (ability to stand trial)
- Financial (ability to manage property – Form 21 of the *Mental Health Act*)
- Personal (ability to care for oneself on a daily basis)

### Legal Aspects of Confidentiality

Advice should always be sought from provincial licensing authorities and/or legal counsel when in doubt.

### CMA Code of Ethics

"Disclose your patients' personal health information to third parties only with their consent, or as provided for by law, such as when the maintenance of confidentiality would result in a significant risk of substantial harm to others or, in the case of incompetent patients, to the patients themselves. In such cases take all reasonable steps to inform the patients that the usual requirements for confidentiality will be breached."

## Confidentiality and Reporting Requirements

- a full and open exchange of information between patient and physician is central to a therapeutic relationship
- privacy is a right of patients (which they may forego), while confidentiality is a duty of doctors (which they must respect barring patient consent or the requirements of the law)
- if inappropriately breached by a doctor, he/she can be sanctioned by the hospital, by the court or by his or her regulatory authority
- based on the ethical principal of patient autonomy, patients have the right to:
  - control their own information
  - expect information concerning them will receive proper protection from unauthorized access by others (see *Privacy of Medical Records*, ELOAM9)
- confidentiality may be ethically and legally breached in certain circumstances, e.g. the threat of harm to others
- unlike the solicitor-client privilege, there is no 'physician-patient privilege' by which a physician, even a psychiatrist, can promise the patient absolute confidentiality
- physicians should seek advice from their local health authority or the Canadian Medical Protective Association (CMPA) before disclosing HIV status of a patient to someone else
  - many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
  - physicians failing to abide by such regulations could be subject to professional or civil actions
- the legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting cases in the common law

## Statutory Reporting Obligations

- legislation has defined specific instances where public interest overrides the patient right to confidentiality; varies by province, but may include:
  - suspected child abuse or neglect – report to local child welfare authorities (e.g. Children's Aid Society)
  - fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see [Geriatric Medicine](#), GM10)
  - communicable diseases – report to local public health authority (see [Population and Epidemiology](#), PH25)
  - improper conduct of other physicians or health professionals – report to college or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
  - vital statistics must be reported; reporting varies by province (in Ontario, births are required to be reported within 30 d to Office of Registrar General or local municipality; death certificates must be completed by a MD then forwarded to municipal authorities)
  - reporting to coroners (see *Physician Responsibilities Regarding Death*, ELOAM13)
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

## Duty to Protect/Warn

- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detainment of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm
- first established by a Supreme Court of California decision in 1976; supported by Canadian courts
- obliged by the CMA Code of Ethics and recognized by some provincial/territorial regulatory authorities
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where:
  - there is a clear risk to identifiable person(s);
  - there is a risk of serious bodily harm or death; and
  - the danger is imminent (i.e. more likely to occur than not)

## Disclosure for Legal Proceedings

- disclosure of health records can be compelled by a court order, warrant, or subpoena

### Reasons to Breach Confidentiality

- Child abuse
- Fitness to drive
- Communicable disease
- Coroner report
- Duty to inform/warn

### Ontario's Medical Expert Panel on Duty to Warn

*Ferris et al., 1998*

- There should be a duty to inform when a patient reveals that he/she intends to do serious harm to another person(s) and it is more likely than not that the threat will be carried out
- Where a threat is directed at a person or group and there is a specific plan that is concrete and capable of commission and the method for carrying it out is available to the threatener, the physician should immediately notify the police and, in appropriate circumstances, the potential victim. The report should include the threat, the situation, the physician's opinion and the information upon which it is based

### CMA Code of Ethics

- Protect the health information of your patients
- Provide information reasonable in the circumstances to patients about the reasons for the collection, use and disclosure of their health information
- Be aware of your patient's rights with respect to the collection, use, disclosure and access to their health information; ensure that such information is recorded accurately

### Lock Boxes

The term "lock boxes" applies to situations where the patient has expressly restricted his or her physician from disclosing specific aspects of their health information to others, even those involved in the patient's circle of care.

## Privacy of Medical Records

- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the *Canadian Charter of Rights and Freedoms*, and the fiduciary duty
- the federal government created the *Personal Information Protection and Electronic Documents Act* (PIPEDA), which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, private labs)
- PIPEDA has been superseded by provincial legislation in many provinces, such as the *Ontario Personal Health Information Protection Act*, which applies more specifically to health information

## Duties of Physicians with Regards to the Privacy of Health Information

- inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
  - under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between health care team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box"
- provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
- provide secure storage of information and implement measures to limit access to patient records
- ensure proper destruction of information that is no longer necessary

## Physician Competence and Professional Conduct

### CanMEDS Competencies (Ethical/Policy Statement)

- a framework of professional competencies established by the Medical Council of Canada (MCC) as objectives for the Medical Council of Canada Qualifying Exam (MCCQE)
- further information on MCC objectives can be found at [www.mcc.ca](http://www.mcc.ca)

#### 1. Communicator

- display sensitivity to people of all ages, races, cultures, religions, sexual orientations, and genders
- accept or refuse patients without consideration of age, race, culture, religion, sexual orientation, and gender
- understand the variation in values and morals and their impact on approaches to care and decision-making
- elicit patients' beliefs, concerns, and expectations about their illness
- conduct patient-centered interviews, ensure patient comprehension

#### 2. Collaborator

- respect all members of the health care team
- identify the roles and competencies of each member, and delegate tasks appropriately
- consult other physicians and health care professionals effectively and appropriately
- consult with patients and families regarding continuing care plans
- be able to outline co-ordination of services (e.g. Public Health, Home Care, Social Services, Workers' Compensation, Children's Aid Society, etc.)

#### 3. Health Advocate

- identify determinants of health:
  - biological (e.g. genes, impact of lifestyle)
  - physical (e.g. food, shelter, working conditions)
  - social (education, employment, culture, access to care)
- influence public health and health policy to protect, maintain, and promote the health of individuals and the community

#### 4. Manager

- meet regulatory requirements in an office practice (e.g. medical record-keeping, narcotic control, infection control, etc.)
- be prudent in utilization of health care resources, based on anticipated cost-benefit balance
- regulate work schedule such that time is available for continuing education

#### 5. Professional

- maintain standards of excellence in clinical care and ethical conduct
- exhibit appropriate personal and interpersonal behaviour
- enhance clinical competence through lifelong learning
- accept responsibility for personal actions
- do not exploit the physician-patient relationship for personal advantage (e.g. financial, academic)

#### 6. Scholar

- commitment to critical appraisal, constructive skepticism
- participate in the learning of peers and others (e.g. students, health care professionals, patients)

#### 7. Medical Expert

- integration of all CanMEDS competencies to provide patient centred care
- combination of knowledge, clinical skills and judgment, procedural skills and professional behaviour for effective patient care

### Legal Considerations

- the competence and conduct of physicians is legally regulated in certain respects to protect patients and society
- physicians are legally required to maintain a license with the appropriate authority
- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to criminal, civil, and disciplinary action
  - sexual conduct includes intercourse, undue touching, inappropriate reference to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in some situations physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact

### Professional Considerations

#### Elderly Patient

- Identify their resuscitation options (CPR or DNR), if applicable
- Check for documentation of advance directives and POA where applicable
- For further details, see [Geriatric Medicine](#), GM12

#### Pediatric Patient

- Identify the primary decision-maker (parents, guardian, wards-of-state, emancipated)
- Regarding capacity assessment see Pediatric Aspects of Capacity Covered by the HCCA (ELOAM8)
- Be wary of custody issues if applicable

#### Terminally Ill or Palliative Patient

- Consider the SPIKES approach to breaking bad news
- What are their goals of care, i.e. disease vs. symptom management?
- Identify advance directives, POA, or SDM, if applicable (see ELOAM7)
- Check for documentation of resuscitation options (CPR or DNR) and likelihood of success
- For further details, see [Geriatric Medicine](#), GM12

#### Incapable Patient

- If not already present, perform a formal capacity assessment
- Identify if the patient has a SDM or who has their POA
- Check the patient's chart for any Mental Health Forms (e.g. Form 1) or any forms they may have on their person (e.g. Form 42)

### CanMeds Competencies

- Communicator
- Collaborator
- Health Advocate
- Manager
- Professional
- Scholar
- Medical Expert

### CMA Code of Ethics

Report any unprofessional conduct by colleagues to the appropriate authority.

- physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
- in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety
- physicians must maintain adequate records for each patient, including:
  - showing that care has been continuous and comprehensive
  - minimal standards for record-keeping include diagnosis, differential diagnosis, appropriate tests and referrals, coherent patient record (full standards available at [www.cpso.on.ca](http://www.cpso.on.ca))
  - keeping records for 10 yr in most jurisdictions
  - although the medical record is the property of the physician or an institution, the patient or the patient's delegate must be allowed full access to information in the medical record upon (usually written) request
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

## Truth Telling

### Ethical Basis

- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed decisions about health care and their lives

### Legal Basis

- required for valid patient consent (see *Consent and Capacity*, ELOAM5)
  - goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision ("standard of disclosure")
- withholding information can be a breach of fiduciary duty and duty of care
- obtaining consent on the basis of misleading information can be seen as negligent

### Evidence about Truth Telling

- most patients want to know what is wrong with them
- although many patients want to protect family members from bad news, they themselves would want to be informed in the same situation
- truth telling improves compliance and health outcomes
- informed patients are more satisfied with their care
- negative consequences of truth telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

### Challenges in Truth Telling

#### Medical Error

- medical error may be defined as 'preventable adverse events' caused by the patient's medical care and not the patient's underlying illness. Some errors may be identified before they harm the patient, so not all error is truly 'adverse'
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient's family and reported to the appropriate health authorities
- physicians should disclose to patients the occurrence of adverse events or errors caused by medical management, but should not suggest that they resulted from negligence because:
  - a) negligence is a legal determination
  - b) error is not equal to negligence (see *Negligence*, ELOAM4)
- disclosure allows the injured patient to seek appropriate corrective treatment promptly
  - physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
  - physicians should offer apologies or empathic expressions of regret ("I wish things had turned out differently") as these can increase trust and are not admissions of guilt or liability
  - *Apology Acts* across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

#### Breaking Bad News

- 'bad news' may be any information that reveals conditions or illnesses threatening the patient's sense of well-being
- caution patients in advance of serious tests about possible bad findings
- give warnings of impending bad news (see sidebar for example) and make sure you provide time for the patient
- poorly done disclosure may be as harmful as non-disclosure
- truth-telling may be a process requiring multiple visits
- adequate support should be provided along with the disclosure of difficult news
- SPIKES protocol was developed to facilitate "breaking bad news"

#### CPSO Policy on Truth Telling

Physicians should provide patients with whatever information that will, from the patient's perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient.

#### Examples of warning of impending bad news:

"I have something difficult to tell you...", "This may come as a shock to you, but the tests indicate...", and "There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem..."

#### Protocol to Break Bad News: SPIKES

- S** Setting the scene and listening skills
- P** Patient's **p**erception of condition and seriousness
- I** Invitation from patient to give information
- K** Knowledge – giving medical facts
- E** Explore emotions and empathize
- S** Strategy and summary

Baile WF and Buckman R 2000

## Arguments Against Truth Telling

- may go against certain cultural norms and expectations
- may lead to patient harm and increased anxiety
- 10-20% of patients prefer not to be informed
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

## Exceptions to Truth Telling

- patients may 'waive' the right to know: patient declines information that would normally be disclosed
- a patient may waive their right to know the truth about their situation when
  - the patient clearly declines to be informed
  - a strong cultural component exists that should be respected and acknowledged
  - the patient may wish others to be informed and make the medical decisions for him/her
- the more weighty the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
- 'Emergencies': an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
- 'Therapeutic privilege'
  - withholding information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress or physical harm to the patient
  - clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones and is a defense of non-disclosure that is rarely accepted anymore. It is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

## Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
- major ethical dilemmas arise when a physician's obligation to the patient comes into conflict with other obligations and incentives
- any exceptions to disclosure for therapeutic consent do not apply in an experimental situation

**Table 3. Ethical Principles for Research Involving Human Subjects**

- Patient's participation in research should not put him/her at a known or probable disadvantage with respect to medical care (i.e. cannot deny participants in research 'known effective care', for example, unethical to randomize some patients who are depressed to a placebo arm)
- Participant's voluntary and informed choice is usually required
  - Consent may not be required in special circumstances: chart reviews without patient contact; emergency situations for which there is no accepted or helpful standard of care and the proposed intervention is not likely to cause more harm than such patients already face
- Access to the treatment that is considered standard
  - Placebo-controlled trials are generally acceptable where patients still receive the standard of care and are informed about the placebo arm and what that entails
- Must employ a scientifically valid design to answer the research question
  - Scientific rigour ensured via peer review, expert opinion
- Must demonstrate sufficient value to justify the risk posed to participants
- Must be conducted honestly (i.e. carried out as stated in the approved protocol)
- Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions
- Patients must not be enticed into risky research by the lure of money and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts
- Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial

Laid out in the Declaration of Helsinki, the Belmont Report, etc.

### Guiding Principles for Research Ethics

- Respect for persons: informed consent
- Beneficence: harm vs. benefit
- Justice: avoid exploitation/unjustified exclusion

### Informed Consent for Research

- Purpose of study
- Sum of funding
- Name and probability of harm and benefits
- Nature of physician's participation including compensation

Proposals for research must be submitted to a research ethics board.

### CMA and CPSO Guidelines for Ethically Appropriate Physician-Industry Relations:

- The primary goal should be the advancement of the health of Canadians
- Relationships should be guided by the *CMA Code of Ethics*
- The physician's primary obligation is to the patient
- Physicians should avoid any self-interest in their prescribing and referral practices
- Physicians should always maintain professional autonomy, independence, and commitment to the scientific method

The *AMA Code of Medical Ethics* has a number of opinions on "Practice Matters" including "Industry representatives in clinical settings," "Financial incentives and the practice of medicine," and "Gifts to physicians from industry," (see <http://www.ama-assn.org/ama/pub/physician-resources/medical-ethics/code-medical-ethics.shtml>).

## Physician-Industry Relations

- health care delivery in Canada involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (e.g. product samples)
- physicians have a responsibility to ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society
- gifts or free products from the pharmaceutical industry are inappropriate
  - sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance
  - physicians receiving such sponsorship must disclose this at presentations or in written articles

## Physician Responsibilities Regarding Death

- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence

## Role of the Coroner

- Coroner's Act* (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs:
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy
  - suddenly and unexpectedly
  - from disease which was not treated by a legally qualified medical practitioner
  - from any cause other than disease
  - under suspicious circumstances
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility

### Notify Coroner if Death Occurs due to:

- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances

## Palliative and End-of-Life Care

- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, loved ones
- appropriate for any patient at any stage of a life-threatening illness
- may occur in a hospital, hospice, in the community or at home
- often an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

### Euthanasia and Physician-Assisted Suicide

- euthanasia: a deliberate act undertaken by one person with the intention of ending the life of another person to relieve that person's suffering where the act is the cause of death
- physician-assisted suicide: the act of intentionally killing oneself with the assistance of a physician who deliberately provides the knowledge and/or the means
- ethical issues and arguments:
  - right to make autonomous choices about the time and manner of own death
  - belief that there is no ethical difference between the acts of euthanasia/assisted suicide and foregoing life-sustaining treatments
  - belief that these acts benefit terminally ill patients by relieving suffering
  - patient autonomy has limits
  - death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death
- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its 'natural course'
- despite all this, refusals of care by the patient that may lead to death ought to be carefully explored by the physician to rule out any 'reversible factors' (poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice
- law
  - Canada: euthanasia and physician-assisted suicide are punishable offences under the Criminal Code of Canada
  - United States: euthanasia is punishable under general homicide laws; Oregon, Washington, and Montana are the only states to have enacted legislation allowing physicians to actively assist patients who wish to end their lives

### Know the Difference

Palliative care assists patients who are dying, but unlike euthanasia or physician-assisted suicide, it does not aim directly at or intend to end the person's life.

### Euthanasia: Ethically Appropriate Actions

- Respect competent decisions to forgo treatment
- Provide appropriate palliative measures
- Decline requests for euthanasia and assisted suicide
- Try to assess reasons for such requests from patients to see if there are 'reversible factors' (such as depression, pain, loneliness, anxiety) that can be treated

## Reproductive and Sexual Health Law and Ethics

### Maternal-Fetal Relationship

- in general, maternal and fetal interests align
- in some situations a conflict between maternal autonomy and the best interests of the fetus may arise

### Ethical Issues and Arguments

- principle of reproductive freedom: women have the right to make their own reproductive choices
- coercion of a woman to accept efforts to promote fetal well-being is an unacceptable infringement of her personal autonomy

### Legal Issues and Arguments

- law: upholds a woman's right to life, liberty, and security of person and does not recognize fetal rights
  - if a woman is competent and refuses medical advice, her decision must be respected even if the fetus will suffer
  - the fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman
- *Royal Commission on New Reproductive Technologies* recommendations:
  - medical treatment must never be imposed upon a competent pregnant woman against her wishes
  - no law should be used to confine a pregnant woman in the interest of her fetus
  - the conduct of a pregnant woman in relation to her fetus should not be criminalized
  - child welfare should never be used to control a woman's behaviour during pregnancy
  - civil liability should never be imposed upon a woman for harm done to her fetus during pregnancy
- examples of implications
  - a woman is permitted to refuse HIV testing during pregnancy, even if vertical transmission to fetus results
  - a woman is permitted to refuse Caesarean section in labour that is not progressing, despite evidence of fetal distress

### Advanced Reproductive Technologies (ART)

- includes non-coital insemination, hormonal ovarian stimulation, and in vitro fertilization (IVF)
- ethical issues and arguments
  - donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  - preimplantation genetic testing for diagnosis before pregnancy
  - lack of sufficient data regarding efficacy and complications to provide the full disclosure needed for truly informed consent
  - use of new techniques without patients appreciating their experimental nature
  - embryo status – the Supreme Court of Canada maintains that fetuses are “unique” but not persons under law; this view would likely apply to embryos as well
  - access to ART
    - ♦ private vs. public funding
    - ♦ social factors limiting access to ART (e.g. same-sex couples)
  - against the ‘commercialization’ of reproduction; e.g. payment of gamete donors is currently illegal in Canada
  - however, no regulations as yet means the ART Act is not being enforced; caught in the legal web as to whether such regulations are a provincial or federal responsibility

### Fetal Tissue

- pluripotent stem cells have been derived from human embryonic and fetal tissue
- potential uses of stem cells in research:
  - studying human development and factors that direct cell specialization
  - evaluating drugs for efficacy and safety in human models
  - cell therapy: using stem cells grown *in vitro* to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson's disease)
  - genetic treatment aimed at altering somatic cells (i.e. myocardial or immunological cells) is acceptable and ongoing
  - genetic treatment aimed at altering germ cells is prohibited in Canada and elsewhere
    - ♦ *Tri-Council Policy Statement: Ethical Conduct for Research Involving Humans* (Government of Canada, 2010)
    - ♦ see TCPS 2 at: <http://www.pre.ethics.gc.ca/eng/policy-politique/initiatives/tcps2-eptc2/Default/>
  - embryo research is permitted up to 14 d post-fertilization
  - embryos created for reproductive purposes that are no longer required may be used
  - gamete providers must give free and informed consent for research use
  - no commercial transactions in the creation and use of the embryos is permitted

The fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman.

Once outside the mother's body, the neonate becomes a member of society with all the rights and protections other vulnerable persons receive.

- Non-treatment of a neonate born alive is only acceptable if <22 wk gestational age (GA)
- 23-25 wk GA: treatment should be a consensual decision between physician and parents
- 25 wk GA and more: neonate should receive full treatment unless major anomalies or conditions incompatible with life are present

Source: *Paed Child Health* 2012:443

### Advanced Reproductive Technologies: Ethically Appropriate Actions

- Educate patients and address contributors to infertility (e.g. stress, alcohol, medications, etc.)
- Investigate and treat underlying health problems causing infertility
- Wait at least 1 yr before initiating treatment with ART (exceptions – advanced age or specific indicators of infertility)
- Educate and prepare patients for potential negative outcomes of ART

Surrogate mothers cannot be paid or offered compensation beyond a reimbursement of their expenses.  
Source: Assisted Human Reproduction Act

No one under age 18 can donate sperm or eggs, except for the purpose of creating a child that the donor plans to raise themselves (example: young patients receiving radiation therapy for cancer that may cause infertility).

Source: *Semen Regulations of the Food and Drug Act*

The CMA remains neutral on the issue of embryonic stem cell research.

- creation of embryos solely for research purposes is prohibited
- human cloning is strictly prohibited
- risks of coercion must be minimized:
  - may not pressure fertility treatment team to generate more embryos than necessary
  - only discuss option of using fetal tissue for research after free and informed choice to have a therapeutic abortion has been made
  - physicians responsible for fertility treatment may not be part of a stem cell research team

### Induced Abortion

- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability
  - fetal viability: fetus >500 g, or >20 wk gestational age
- CMA policy on induced abortion:
  - induced abortion should not be used as an alternative to contraception
  - counselling on contraception must be readily available
  - full and immediate counselling services must be provided in the event of unwanted pregnancy
  - there should be no delay in the provision of abortion services
  - no patient should be compelled to have a pregnancy terminated
  - physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician
  - no discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do
  - induced abortion should be uniformly available to all women in Canada and health care insurance should cover all the costs (N.B. the upper limit of gestational age for which coverage is provided varies between provinces)
  - elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances
- ethical and legal issues and arguments:
  - according to common law, the rights of a fetus are not equal to those of a human being
  - no law currently regulates abortion in Canada – it is a woman's medical decision to be made in consultation with whom she wishes; no mandatory role for spouse/family
  - 2nd and even 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the woman's health or if the fetus has died in utero or has major malformations (e.g. anencephaly)

### Prenatal/Antenatal Genetic Testing

- uses:
  - confirm a clinical diagnosis
  - detect genetic predisposition to a disease
    - ♦ allows preventative steps to be taken and helps patient prepare for the future
  - give parents the option to terminate a pregnancy or begin early treatment
- ethical dilemmas arise because of the nature of genetic information:
  - it has individual and familial implications
  - it pertains to future disease
  - it often identifies disorders for which there are no effective treatments or preventive steps
  - also can be used to identify the sex of the fetus leading to termination of pregnancy if the fetus is of the unwanted sex; this is considered inappropriate by some but is entirely legal as a woman can request an abortion for any reason
- ethical issues and arguments:
  - obtaining informed consent is difficult due to the complexity of genetic information
  - doctor's duty to maintain confidentiality vs. duty to warn family members
  - risk of social discrimination (e.g. insurance) and psychological harm
- law:
  - no current specific legislation exists
  - testing requires informed consent
  - no standard of care exists for clinical genetics but physicians are legally obligated to inform patients that prenatal testing exists and is available
  - breach of confidentiality – duty to warn family members
    - ♦ only acceptable if can likely prevent serious harm, such as if treatment or prevention is available (e.g. familial adenomatous polyposis)

#### Genetic Testing: Ethically Appropriate Actions

- Thorough discussion and realistic planning with patient before testing is done
- Genetic counselling for delivery of complex information, supportive discussion

## Organization of Health Care in Canada

- one federal, three territorial, and ten provincial systems
- federal system provides care to Aboriginal groups, the RCMP, and the armed forces
- financed by both the public (70%) and private (30%) sectors
- each provincial plan must cover all medically necessary health services delivered in hospitals and by physicians; may choose to cover services such as home care and prescription drugs
- non-insured health services and fees are either covered by private insurance or by the individual
- workers' compensation funds cover treatment for work-related injuries and diseases

## Legal Foundation

The legal foundation of the Canadian health system is based on two constitutional documents:

1. *Constitution Act* (1867): deals primarily with the jurisdictional power between federal and provincial governments
2. *The Canadian Charter of Rights and Freedoms* (1982): does not guarantee a right to health care but, given government's decision to finance health care, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physician's mobility rights, etc.)

And two statutes:

1. *Canada Health Act* (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
2. *Canada Health and Social Transfer Act* (1996): federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion

## History

- 1867 *British North America Act* (now *Constitution Act*) establishes Canada as a confederacy
- government has minimal role in health care at this time
  - "establishment, maintenance, and management of hospitals" under provincial jurisdiction
- 1947 Saskatchewan introduces universal hospital insurance
- based on taxes and premiums
  - other provinces follow
- 1957 Federal government passes *Hospital Insurance and Diagnostic Services Act*
- provinces with universal hospital insurance receives federal funds
  - federal government pays for approximately 50% of insured services
- 1962 Saskatchewan implements universal medical care insurance
- physician services included
- 1965 *Royal Commission on Health Services (Hall Commission)* recommends federal leadership and financial support with provincial government operation
- 1966 *Medical Care Act* passed by federal government
- federal government contribution maintained at 50% on average, with poorer provinces receiving more funds
  - medical insurance must be comprehensive, portable, universal, and publicly administered
- 1977 *Established Programs Financing Act* passed by federal government
- federal government gives "tax points" to provinces by reducing federal taxes and allowing provinces to collect more
  - funding no longer tied to direct services → federal influence wanes
  - provinces bear greater costs and impose restrictions on physicians
  - physicians respond with "extra-billing"; patients pay a supplementary fee
- 1984 *Canada Health Act* passed by federal government
- replaced *Medical Care Act* and *Hospital Insurance and Diagnostic Services Act*
  - extra-billing banned by new fifth criterion: Accessibility
- 1996 *Canada Health and Social Transfer Act* passed by federal government
- federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion
- 1999 *Social Union Framework Agreement* signed by the Prime Minister and all Premiers and territorial leaders except Quebec
- federal and provincial/territorial governments vow to concentrate their efforts to modernize Canadian social policy
- 2001 *Kirby and Romanow Commissions* appointed
- Kirby Commission* (final report, October 2002)
- one-member committee of the Senate: examined history of health care system in Canada, pressures and constraints of current health care system, role of federal government, and health care systems in foreign jurisdictions
- Romanow Commission* (final report, November 2002)
- one-member royal commission (former Saskatchewan Premier Roy Romanow) appointed by the Prime Minister to inquire into and undertake dialogue with Canadians on the future of Canada's public health care system

- 2003 *First Ministers' Accord on Health Care Renewal* signed
- First Ministers agreed on an action plan to improve access to quality care for all Canadians and to prepare an annual public report on primary and home care
  - First Health Council (composed of government and expert/public representatives) appointed to improve accountability in the health care system
- 2004 *First Ministers' Meeting on the Future of Health Care* produces a 10-yr plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and primary care reform
- 2005 *Chaoulli v. Quebec*, Supreme Court of Canada Decision
- ruled that Quebec's banning of private insurance would be unconstitutional under the Quebec Charter of Rights, given that patients do not have access to those services under the public system in a timely way
  - Quebec government was given one year to respond
- 2011 First progress report by the Health Council reviews progress towards 2004 First Ministers' 10 yr plan
- significant reductions in wait times for specific areas (such as cancer, joint replacement and sight restoration) while these reductions may have inadvertently caused increases in wait times of other services
  - despite large investments into electronic medical records (EMRs), Canada continues to have very low uptake, ranking last in the Commonwealth Fund International Health Policy survey, with use of only 37% use by primary care physicians
  - little progress in creating a national strategy for equitable access to pharmaceuticals; however, there has been some success in increasing pharmacists' scope of practice, reducing generic drugs costs and implementing drug info systems
- Federal Government announces that it will not renew 2004 *First Ministers' Accord on Health Care Renewal*
- increases in funding to provinces at 6% per annum until the 2016-2017 fiscal year, from then onwards, increases tied to nominal GDP at a minimum of 3% per annum
- 2012 Second progress report by the Health Council reviews progress towards 2004 First Ministers' 10 yr plan
- funding is sufficient; however, more innovation is needed including incentivizing through models of remuneration
  - 46 recommendations were made to address the lack of progress in prevention, access to primary-care physicians, long-term, respite and palliative care services, wait-time benchmarks, accountability, IT, Aboriginal health and more
- 2013 Federal Government announces that it will stop funding the Health Council of Canada in 2014
- the council (born in 2004) will close in 2014 leaving no other independent national body to assess the performance of the Canadian health care system
- 2014 Expiry of current *10 Year Health Care Funding Agreement* between Federal and Provincial governments

## Key Principles of the *Canada Health Act*

1. Public Administration
  - provincial health insurance programs must be administered by public authorities
2. Comprehensiveness
  - provincial health insurance programs must cover all necessary diagnostic, physician, and hospital services
3. Universality
  - all eligible residents must be entitled to health care services
4. Portability
  - emergency health services must be available to Canadians who are outside their home province, paid for by the home province
5. Accessibility
  - user fees, charges, or other obstructions to insured health care services are not permitted

The federal government can reduce its contributions to provinces that violate the key principles of the *Canada Health Act*.

### Principles of Canada Health Act

- Public Administration
- Comprehensiveness
- Universality
- Portability
- Accessibility

## Health Care Expenditure and Delivery in Canada

- projected total health care expenditure in 2009 was \$182.1 billion, 11.9% of the GDP, approx. \$4,363 USD per capita (*Canadian Institute of Health Information*)
- 2009 Canadian health care expenditure as a percentage of GDP ranked 6 out of 29 for Organization for Economic Cooperation and Development (OECD) member nations (*Canadian Institute of Health Information*)
- 70.9% of health care spending came from public sector sources in 2009 as compared to 47.7% in the US
- in 2006 there were 2.1 physicians per 1000 population, ranking 26th out of OECD member countries

### Delivery of Health Care

- hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities
- this differs from other countries, such as the US (a mix of public and private funding, as well as private-for-profit and private not-for-profit delivery) and the UK (primarily public funding and delivery)

**Figure 2. Health expenditure in Canada by use of funds (billions of dollars), 2009**

Source: Canadian Institute for Health Information. National Health Expenditure Trends. 1975 to 2011

**Figure 3. Canadian health care dollars by source of funds, 2007**

Source: Canadian Institute for Health Information. National Health Expenditure Trends. 1975 to 2009

#### Payments for Care at Private For-Profit and Private Not-for-Profit Hospitals:

##### A Systematic Review and Meta-analysis

CMAJ 2004;170:1817-1824

Meta-analysis of 8 US observational studies involving more than 350 000 patients. Concluded that care provided by private for-profit hospitals was more expensive (Relative payments for care = 1.19; 95% CI = 1.07-1.33; p = 0.001). If half of Canadian hospitals were converted to private for-profit institutions, an extra \$3.6 billion would be paid annually.

## Ethical Considerations in Resource Allocation and Physicians' Role

- the distribution of goods and services to programs and people
- physicians have the duty to inform patients about therapeutic options even if they are not available
- consider justice: physicians must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
  - need and benefit are morally relevant criteria for resource allocation
  - gender, sexual orientation, religion, level of education or age alone are morally irrelevant criteria
- ethical dilemmas that arise when deciding how best to allocate resources
  - fair chances versus best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
  - priorities problem: how much priority should the sickest patients receive?
  - aggregation problem: modest benefits to many vs. significant benefits to few
  - democracy problem: when to rely on a fair democratic process to arrive at a decision
- guidelines for appropriately allocating resources
  - the physician's primary obligation is to protect and promote the welfare and best interests of his or her patients
  - choose interventions known to be beneficial on the basis of evidence of effectiveness
  - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
  - advocate for one's patients but avoid manipulating the system to gain unfair advantage for them
  - resolve conflicting claims for scarce resources justly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures
  - inform patients of the impact of cost constraints on care, but in a sensitive way
  - seek resolution of unacceptable shortages at the level of hospital management or government

#### CPSO Policy on Resource Allocation

Physicians should "recognize [their] responsibility to promote fair access to health care resources" and should "use health care resources prudently."

## Role of the Provincial Licensing Authorities

- the medical profession in Canada self-regulates under the authority of provincial legislation;
- physicians in each province are self-regulated by a licensing authority (e.g. College of Physicians and Surgeons of Ontario, the CPSO); membership is mandatory to practice in that province
- self-regulation is based on the premise that the licensing authority must act first and foremost in the interest of the public
- licensing authority functions include:
  - provincial licensing authorities provide non-transferable licensure to physicians
  - issuing non-transferable licenses allow doctors to practice only in that province
  - maintaining ethical, legal, and competency standards and developing policies to guide doctors
  - investigating complaints against doctors
  - disciplining doctors guilty of professional misconduct or incompetence
  - at times of license investiture and renewal, physicians must disclose if they have a condition (such as HIV positivity or drug addiction or other illness that may impact their ability to practice safely)
- in an evolving area of responsibility, physicians may be required to report colleagues who may be a hazard to patients (e.g. the inebriated colleague)

## Licensure and Certification

- the Medical Council of Canada (MCC) certifies physicians
  - certification is known as the Licentiate of the MCC (LMCC)
  - LMCC is acquired by passing the MCC Qualifying Examination Parts I and II
- the Royal College of Physicians and Surgeons of Canada (RCPSC) certifies specialists who complete an accredited residency program and pass the appropriate exam
  - voluntary membership of RCPSC is designated FRCPC or FRCSC (Fellow of the Royal College of Physicians/Surgeons of Canada)
- the College of Family Physicians of Canada (CFPC) certifies family physicians who complete an accredited residency program and pass the Certification Examination in Family Medicine
- the RCPSC and CFPC are responsible for monitoring ongoing continuing medical education (CME) and professional development

Certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities.

## Role of Professional Associations

- membership in a provincial or national association is voluntary
- provincial medical associations represent the economic and professional interests of doctors
- the Canadian Medical Association (CMA) is a national association that provides leadership to doctors and advocates for access to high quality health care in Canada
- the CMA represents physician and population concerns at the national level, while the provincial medical associations negotiate fee and benefit schedules with provincial governments
- medical residents are represented nationally by the Canadian Association of Interns and Residents, and provincially by Provincial Housestaff Organizations, which uphold the economic and professional interests of residents
- medical students are represented at their universities by student societies; these bodies collectively form the Canadian Federation of Medical Students; francophone medical schools participate in the Federation of Quebec Medical Student Societies
- the Canadian Medical Protective Association (CMPA), a physician-run organization, is a voluntary insurance association that protects the integrity of member physicians by providing legal defense against allegations of malpractice or negligence and by providing risk management and educational programs, and general advice

## The US Health Care System

- the United States health care system is more market-based than the Canadian system
- it is funded and delivered by a mixture of the public, private, and voluntary sectors; private-for-profit is the prevailing method of delivery
- public funding is derived from taxes raised at both the federal and state government levels

## History

- 1850 Franklin Health Insurance Company of Massachusetts
- offers accident insurance to cover injuries acquired during railroad or steamboat travel
  - informal “sickness insurance” evolved from this to cover different injuries or diseases
- 1901 American Medical Association established as the national organization of state and local medical groups
- 1929 Baylor Plan developed
- created by Dr. Justin Ford Kimball to ensure that teachers could pay their medical bills
  - teachers pay 50 cents/month in exchange for guarantee of medical services for 21 d
- 1930s More hospitals adopt medical insurance plans as per the Baylor Plan
- emergence of private, commercial, health insurance as a service of life insurance companies
- 1939 Community hospitals work together to create health care plans
- American Hospital Association (AHA) uses the term “Blue Cross” to describe health care plans that meet their standards
  - emergence of prepaid plans covering physician and surgeon services
- 1940s and 1950s
- employee benefit plans increase in number with more comprehensive health care insurance packages
  - companies compete for employees using the proposed health care plan
  - reason why workplace is currently main source of health care insurance
- 1946 Blue Shield created and represents physician sponsored health care plans
- 1954 Social Security coverage begins to include disability benefits
- 1960 Blue Cross becomes the official designation for AHA health care plans
- 1965 Medicare and Medicaid programs introduced government funded health care plans
- 1971 Blue Cross and Blue Shield merge into one company
- 1970s and 1980s
- emergence of Health Maintenance Organizations (HMOs)
  - HMOs offer managed care plans: health care packages that are provided by an HMO approved network of health care providers
- 1993 Universal health care system proposed but rejected by congress
- 1996 *Mental Health Parity Act* passed
- invoked to decrease discrimination in health care coverage for mental health illnesses
  - aggregate annual and lifetime limits for mental health services must match aggregate annual and lifetime limits for medical and surgical services
- 1996 *Health Insurance Portability and Accountability Act* passed
- Title 1: Health Care Access, Portability, and Renewability
    - provides protection of health care coverage to employees and their families if they change or lose their job
  - Title 2: Preventing Health Care Fraud and Abuse; Administrative Simplification; Medical Liability Reform
    - addresses and establishes national standards for electronic health care transactions and security and privacy of health data
- 1997 State Children’s Health Insurance Program (SCHIP) created
- states extend health coverage to uninsured children
- 1999 *Ticket to Work and Work Incentives Improvement Act*
- enables people with disabilities to be employed without affecting their Medicaid or Medicare coverage
- 2010 *Affordable Care Act*
- reform to health care to improve access to affordable health coverage and creates regulations on activities of private health insurance providers

## Health Care Expenditure and Delivery in the US

- health care spending in the US represents a large economic sector
  - health care comprises over 17.4% of the gross domestic product (GDP) (highest in the OECD), amounting to \$7960 USD per capita in 2009
  - one advantage is the widespread availability of technology – the US has 4 times as many MRI machines per capita than Canada
- the US scores poorly on some indicators of population health, with a life expectancy below the OECD average and infant mortality above the OECD average. Possible factors that account for this discrepancy are:
  - poor health of large uninsured population
  - high cost of health care administration
  - the provision of inefficient high-cost, high-intensity care
    - the higher-spending regions in the US do not provide any better quality of care, access to care, health outcomes or satisfaction with care when compared to the lower-spending regions
- the US has the highest level of obesity of all OECD nations at 34.3%; this has major implications for future health care spending

### Cost of Health Care Administration in the United States and Canada *NEJM* 2003;349:768-775

Administrative costs were estimated from data on insurance overhead, employers' costs to manage benefits, and the administrative costs of hospitals, practitioners' offices, nursing homes, and home care. In 1999, the cost of U.S. health administration was \$1,059 per capita, more than three times greater than the cost in Canada (\$307 per capita).

## Access to Health Services

- 70% of Americans under the age of 65 have private health insurance, either employer-sponsored or individually purchased; 12% receive health care through public health insurance; 18%, mainly the poor, have no health insurance
- access to publicly funded health services occurs primarily through two programs, Medicare and Medicaid, which were created by the 1965 *Social Security Act*
- other federal government-funded health programs include the Military Health Services System, the Veterans Affairs Health Services System, the Indian Health Service, and the Prison Health Service

**Table 4. Medicare and Medicaid Program Information**

	Medicare	Medicaid
<b>Eligibility</b>	People over the age of 65 People with end stage renal disease People of any age meeting the Medicare definition of disability	People who receive funds through social assistance programs Pregnant women People with developmental disabilities Low-income children through the 1997 State Children's Health Insurance Program
<b>Coverage</b>	Basic "Part A" providing inpatient hospital care, home care, limited skilled nursing facility care, and hospice care Supplemental "Part B" covers outpatient physician and clinic services, and requires payment of a further monthly fee	Basic coverage involves inpatient and outpatient hospital care, laboratory and x-ray services, skilled nursing care, home care, physician services, dental services, and family planning Financing for Medicaid is provided jointly by the federal and state governments, and program details vary greatly between states
<b>Co-payment</b>	To help pay for out-of-pocket expenditures, and to cover many of the services not insured by Medicare, the majority of Medicare beneficiaries buy supplemental private health insurance	States may impose deductibles, coinsurance, or co-payments on some Medicaid recipients for certain services Medicaid is not health insurance – coverage is unreliable as improvement in an individual's financial status can lead to a loss of Medicaid eligibility

Source: Centers for Medicare and Medicaid Services. <http://www.cms.gov>

## Health Care Reform

- Patient Protection and Affordable Care Act* and the *Health Care and Education Reconciliation Act of 2010* are federal statutes signed into law in March 2010 that include a number of new health care provisions to be implemented over 8 yr
  - expand Medicaid eligibility, provide subsidies for insurance premiums and incentives for businesses to provide health care benefits, prohibit denial of coverage/claims for pre-existing conditions, and establish health-insurance exchanges
  - costs are offset by a number of health care related taxes, including a tax penalty for citizens with no health insurance (low income persons are exempt)

## Anesthesia Basics

### Types of Anesthesia

- **general**
  - general anesthesia (GA)
  - total IV anesthesia (TIVA)
- **regional**
  - spinal, epidural
  - peripheral nerve block
  - IV regional
- **local**
  - local infiltration
  - topical
- **sedation**
  - monitored anesthesia care
- note that different types of anesthesia can be combined (e.g. general + regional)

#### 6 As of General Anesthesia

Anesthesia  
 Anxiolysis  
 Amnesia  
 Areflexia (muscle relaxation not always required)  
 Autonomic Stability  
 Analgesia

## Pre-Operative Assessment

- to identify the patient's medical and surgical issues
- to allow for the arrangement of further investigations, consultations and treatments for patients not yet optimized
- to plan and consent for anesthetic techniques

## History and Physical

### History

- indication for surgery
- surgical/anesthetic Hx: previous anesthetics/complications, previous intubations, medications, drug allergies
- PMHx:
  - CNS: seizures, strokes, raised ICP, spinal disease
  - CVS: CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS class, NYHA class (see [Cardiology and Cardiovascular Surgery](#), C31 for NYHA classification)
  - respiratory: smoking, asthma, COPD, recent upper respiratory tract infection, sleep apnea
  - GI: GERD, liver disease
  - renal: insufficiency, dialysis, chronic kidney disease
  - hematologic: anemia, coagulopathies, blood dyscrasias
  - MSK: conditions associated with difficult intubations – arthritides (e.g. rheumatoid arthritis), cervical tumours, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery, Down syndrome, scleroderma, obesity, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
  - endocrine: diabetes, thyroid disorders, adrenal disorders
  - other: morbid obesity, pregnancy, ethanol/other drug use
- FHx: malignant hyperthermia, atypical cholinesterase (pseudocholinesterase), other abnormal drug/anesthetic reactions

### Physical Examination

- examination of organ systems
  - focused physical exam of the CNS, CVS and respiratory systems
  - general assessment of nutrition, hydration and mental status
  - pre-existing motor and sensory deficits
- oropharynx and airway assessment to determine the likelihood of difficult intubation
  - no single test is specific or sensitive – all aid in determining the ease of intubation
  - ability to assume “sniffing position” – upper cervical spine extension, lower cervical spine flexion, previous cervical spine surgery
  - Mallampati classification (Figure 1)
  - “3-2-1 rule”
    - ♦ thyromental distance (the distance of the lower mandible in the midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
    - ♦ mouth opening (<2 finger breadths is associated with difficult intubation)
    - ♦ anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
  - tongue size
  - dentition, dental appliances/prosthetic caps – must inform patients of the rare possibility of damage
  - nasal passage patency (if planning nasotracheal intubation)
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, central venous pressure (CVP) and pulmonary artery (PA) catheters

Figure 1. Mallampati classification of oral opening

#### Impact of Anesthesia Management Characteristics on Severe Morbidity and Mortality

Anesth 2005;102:257-268

**Study:** Case-control study of patients undergoing anesthesia.

**Patients:** 807 cases and 883 controls were analyzed among a cohort of 869,483 patients undergoing anesthesia between 1995-1997. Cases were defined as patients who either remained comatose or died within 24 h of receiving anesthesia. Controls were defined as patients who neither remained comatose nor died within 24 h of receiving anesthesia.

**Intervention:** General, regional or combined anesthesia to patients undergoing a surgical procedure.

**Main Outcome:** Coma or death within 24 h of receiving anesthesia.

**Results:** The incidence of 24 h postoperative death was 8.8 per 10,000 anesthetics (95% CI, 8.2-9.5) and the incidence of coma was 0.5 (95% CI, 0.3-0.6). Anesthesia management risk factors that were associated with a decreased risk of morbidity and mortality were equipment check with protocol and documentation, directly available anesthesiologist with no change during anesthesia, 2 persons present at emergence of anesthesia, reversal of muscle relaxation and postoperative pain medication.

## Pre-Operative Investigations

Table 1. Suggested Indications for Specific Investigations in the Pre-Operative Period

Test	Indications
<b>CBC</b>	Major surgery requiring group and screen or cross and match; chronic cardiovascular, pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient less than 1 yr of age
<b>Sickle cell screen</b>	Genetically predisposed patient (hemoglobin electrophoresis if screen is positive)
<b>INR, aPTT</b>	Anticoagulant therapy, bleeding diathesis, liver disease
<b>Electrolytes and creatinine</b>	Hypertension, renal disease, diabetes, pituitary or adrenal disease; digoxin, diuretic or other drug therapies affecting electrolytes
<b>Fasting glucose level</b>	Diabetes (repeat on day of surgery)
<b>Pregnancy (β-HCG)</b>	Women who may be pregnant
<b>ECG</b>	Heart disease, diabetes, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma
<b>Chest radiograph</b>	Cardiac or pulmonary disease, malignancy

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

## Fasting Guidelines

### Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists' Society)

- **8 hours** after a meal that includes meat, fried or fatty foods
- **6 hours** after a light meal (such as toast or crackers) or after ingestion of infant formula or nonhuman milk
- **4 hours** after ingestion of breast milk or Jello
- **2 hours** after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)

## American Society of Anesthesiology (ASA) Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- **ASA 1:** a healthy, fit patient
- **ASA 2:** a patient with mild systemic disease
  - e.g. controlled type 2 diabetes mellitus (DM), controlled essential HTN, obesity, smoker
- **ASA 3:** a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- **ASA 4:** a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure

- **ASA 5:** a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- **ASA 6:** declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter **E** after classification (e.g. ASA 3E)

## Pre-Operative Optimization

- in general, any fluid and/or electrolyte imbalance should be corrected prior to elective surgery

## Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- **pre-operative medications to consider**
  - prophylaxis
    - ♦ risk of GE reflux: sodium citrate 30 mL PO or ranitidine 150-300 mg PO or metoclopramide 10 mg PO 30 min to 1 h pre-op
    - ♦ risk of infective endocarditis, GI/GU interventions: antibiotics
    - ♦ risk of adrenal suppression: steroid coverage
    - ♦ consider benzodiazepines for the anxious patient
    - ♦ bronchodilators (COPD, asthma)
    - ♦ nitroglycerin and  $\beta$ -blockers (CAD risk factors)
- **pre-operative medications to stop**
  - oral hypoglycemics: stop on morning of surgery
  - antidepressants: stop on morning of surgery
  - ACE inhibitors and angiotension receptor blockers: stop on morning of surgery
  - warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel)
    - ♦ discuss peri-operative use of ASA, NSAIDs with surgeon
- **pre-operative medication to adjust**
  - insulin (consider insulin/dextrose infusion), prednisone, bronchodilators

## Hypertension

- mild to moderate HTN is not an independent risk factor for peri-operative cardiovascular complications
- target sBP <180 mmHg, dBP <110 mmHg
- assess for end-organ damage and treat accordingly

## Coronary Artery Disease (CAD)

- ACC/AHA Guidelines (2007) recommend postponing elective surgery 4-6 wk following an MI
- this period carries an increased risk of reinfarction/death
  - <3 mo after MI – 37% patients may reinfarct
  - 3-6 mo after MI – 15%
  - >6 mo after MI – risk remains constant at 5%
- if operative procedure is essential and cannot be delayed, invasive intra- and post-operative ICU monitoring reduces the risk to 6%, 2% and 1% respectively for the above time periods
- mortality with peri-operative MI is 20-50%
- initiation of peri-operative  $\beta$ -blockade previously advocated; currently, some recent studies have suggested an increased risk of stroke
  - $\beta$ -blockade should be continued if already started
  - initiate  $\beta$ -blockade if inducible ischemia, CAD or multiple cardiac risk factors and undergoing high risk surgery
  - consider initiating and optimizing  $\beta$ -blockade if CAD or multiple cardiac risk factors and undergoing intermediate risk surgery

## Endocrine Disorders

- diabetes mellitus
  - hypoglycemia
    - ♦ caused by drugs and surgical stresses and masked by anesthesia
    - ♦ appropriate use of dextrose/insulin infusion and blood glucose monitoring
  - end organ damage: be aware of damage to CVS, renal and nervous systems, including autonomic neuropathy

### Effects of Extended-Release Metoprolol Succinate in Patients Undergoing Non-Cardiac Surgery (POISE trial): A Randomized Controlled Trial

*Lancet* 2008;371:1839-1847

**Purpose:** To investigate the role of  $\beta$ -blockers (metoprolol) peri-operatively in patients with known vascular disease undergoing non-cardiac surgery.

**Methods:** Patients from 190 centres in 23 countries were eligible if they were age >45, undergoing non-cardiac surgery and were known to have significant vascular disease. Patients were randomized to either the metoprolol group or placebo. Participants received metoprolol (or placebo) 100 mg 2-4 h prior to surgery, 6 h after surgery, and then 20 mg daily for 30 d. The primary endpoint was a composite of cardiovascular death, non-fatal myocardial infarction and non-fatal cardiac arrest. Analysis was by intention to treat.

**Results:** 8351 patients were recruited into the study, with 8331 completing the 30 d course. Use of metoprolol was found to significantly reduce the risk of cardiovascular death, non-fatal MI or non-fatal cardiac arrest vs. placebo (hazard ratio 0.84,  $p < 0.05$ ) but significantly increased the rate of stroke (hazard ratio 2.17,  $p < 0.01$ ) and overall risk of death (hazard ratio 1.33,  $p < 0.05$ ).

**Conclusion:** Use of peri-operative  $\beta$ -blockers (metoprolol) in patients with known vascular disease provides both risks and benefits, and these must be considered for each patient individually.

- hyperthyroidism
  - can experience sudden release of thyroid hormone (thyroid storm)
  - treatment:  $\beta$ -blockers and pre-op prophylaxis
- adrenocortical insufficiency (e.g. Addison's, exogenous steroid use)
  - consider steroid coverage if steroid use of >1 wk in past 6 mo

## Respiratory Diseases

- smoking
  - adverse effects: altered mucus secretion and clearance, decreased small airway caliber and altered immune response
  - abstain at least 8 wk pre-op if possible
  - if unable, abstaining even 24 h pre-op has shown benefit
- asthma
  - increased risk of bronchospasm from intubation, delivery of desflurane
  - pre-op management depends on degree of baseline asthma control
  - pre-op SABA, LABA, ICS, OCS may be used up to 1 wk pre-op to achieve adequate asthma control
  - avoid non-selective  $\beta$ -blockers; cardioselective  $\beta$ -blockers (e.g. metoprolol, atenolol) do not increase risk of bronchospasm in the short term
  - cancel/delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
- COPD
  - anesthesia, surgery and analgesia predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation and respiratory failure
  - cancel/delay elective surgery for acute exacerbation
  - optimize with bronchodilators  $\pm$  ICS  $\pm$  antibiotics

### $\beta$ -blockers

- $\beta_1$  receptors are located primarily in the heart and kidneys
- $\beta_2$  receptors are located in the lungs
- Non-selective  $\beta$ -blockers block  $\beta_1$  and  $\beta_2$  receptors. Caution is required with non-selective  $\beta$ -blockers, particularly in patients with respiratory conditions where  $\beta_2$  blockade can result in airway reactivity

## Aspiration

- conditions with increased risk of aspiration:
  - decreased LOC
  - trauma
  - meal within 8 h
  - suspected sphincter incompetence (GERD, hiatus hernia, nasogastric tube)
  - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
- management: reduce gastric volume and acidity, delay inhibiting airway reflexes, employ rapid sequence induction if increased risk (see *Rapid Sequence Induction*, A9)
- increased risk with laryngeal mask instead of endotracheal tube (ETT)

## Monitoring

### Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a peri-operative anesthetic record: HR and BP every 5 min, dose and route of drugs and fluids
- continuous monitoring: see *Routine Monitors* below

### Routine Monitors for All Cases

- **pulse oximeter**, apparatus to measure BP, **electrocardiography**, **capnography** for general anesthesia and sedation (Ramsey Sedation Scale 4-6), agent-specific anesthetic gas monitor when inhalation anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometer

### Elements to Monitor

- anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, fraction of inspired  $O_2$  ( $FiO_2$ )
- ventilation: verify correct position of ETT, chest excursions, breath sounds,  $ET_{CO_2}$  analysis, end tidal inhaled anesthesia analysis
- circulation: pulse, heart sounds, BP, telemetry, oximetry, CVP, pulmonary capillary wedge pressure
- temperature: temperature probe

### Pre-Anesthetic Checklist

#### SAMMM

**Suction:** connected and working  
**Airways:** laryngoscope and blades, ETT, syringe, stylet, oral and nasal airways, tape, bag and mask  
**Machine:** connected, pressures okay, all meters functioning, vaporizers full  
**Monitors:** available, connected and working  
**Medications:** IV fluids and kit ready, emergency medicines in correct location and accessible

Figure 2. Typical anesthesia monitor

## Induction Agents

- induction may be achieved with intravenous agents, volatile agents or both

### Intravenous Agents

- see Table 12, A25
- IV induction agents include a selection of non-opioid drugs used to provide amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with little adverse effects
  - e.g. propofol, sodium thiopental (not available in North America) or ketamine
  - a continuous propofol infusion may also be used for the maintenance phase of GA

### Volatile Inhalational Agents

- see Table 15, A26
- general concepts of volatile agents are discussed below
  - e.g. sevoflurane, desflurane, isoflurane, enflurane, halothane and nitrous oxide

#### MAC (minimum alveolar concentration)

- definition: the alveolar concentration of an agent at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- often 1.2-1.3 times MAC will ablate response to stimuli in the general population
- potency of inhalational agents is compared using MAC
- MAC values are roughly additive when mixing N<sub>2</sub>O with another volatile agent (i.e. 0.5 MAC of a potent agent + 0.5 MAC of N<sub>2</sub>O = 1 MAC of potent agent; however, this only applies to movement, not other effects such as BP changes and does not hold over the entire N<sub>2</sub>O dose range)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, usually 0.3-0.4 of the usual MAC value

Table 2. Ramsay Sedation Scale

Value	Description	Test to Follow
1	Awake: Patient is anxious and agitated, or restless, or both	Observe the patient
2	Awake: Patient is co-operative, orientated, and tranquil	Observe the patient. Does patient make eye contact and respond to commands?
3	Awake: Patient responds to commands only	Talk to the patient. Does patient make eye contact and respond to commands?
4	Asleep: Patient reacts with a brisk response to a light glabellar tap or a loud auditory stimulus	Physically stimulate the patient by shaking the shoulder while speaking loudly. Does patient respond within 10 s?
5	Asleep: Patient reacts with a sluggish response to a light glabellar tap or a loud auditory stimulus	Physically stimulate the patient by shaking the shoulder while speaking loudly. Does patient respond after 10 s?
6	Asleep: Patient does not respond to pain	Use painful stimuli. No response

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

#### Determinants of Speed of Onset of Volatile Anesthetics

- Solubility:** decrease solubility → increase rate of induction
- Cardiac output (CO):** as CO increases, anesthetic uptake to blood increases and alveolar gas concentration decreases, thus delaying induction
- Partial pressure difference between alveolar and venous blood:** increase gradient → decrease rate of induction
- Inspired gas concentration:** increase inspired concentration → increase rate of induction
- Alveolar ventilation:** increase alveolar ventilation → increase rate of induction
- Second gas effect:** when 2 gases are administered together, uptake of the first gas (e.g. N<sub>2</sub>O) increases the alveolar concentration of the second gas (e.g. desflurane), increasing rate of induction

#### Solubility of Volatile Anesthetics in Blood Least Soluble to Most Soluble

Nitrous oxide < desflurane < sevoflurane < isoflurane < halothane

## Muscle Relaxants and Reversing Agents

- see Tables 16 and 17, A27; Table 18, A28
- depolarizing muscle relaxants: succinylcholine (SCh)
- non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cisatracurium, pancuronium

**Figure 3. Anatomy and physiology of the neuromuscular junction (NMJ)**

### Muscle Relaxants

- never use without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects:
  1. facilitates intubation
  2. assists with mechanical ventilation
  3. prevents muscle stretch reflex and decreases muscle tone
  4. allows access to the surgical field (intracavitary surgery)
- blocks nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- nerve stimulator is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade

### Reversing Agents for Non-Depolarizing Muscle Relaxants (e.g. neostigmine, pyridostigmine, edrophonium)

- reversal agents are acetylcholinesterase inhibitors
  - inhibits enzymatic degradation of ACh; increases amount of ACh at nicotinic and muscarinic receptors, displacing non-depolarizing muscle relaxant
  - administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation and increased bowel peristalsis)

#### Plasma Cholinesterase

Plasma cholinesterase is produced by the liver and metabolizes SCh, ester local anesthetics and mivacurium. A prolonged duration of blockade by SCh occurs with:

- (a) decreased quantity of plasma cholinesterase, e.g. liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism
- (b) abnormal quality of plasma cholinesterase, i.e. normal levels but impaired activity of enzymes, genetically inherited

## Airway Management

### Airway Anatomy Review

- normal airway: nares → nasal cavities → nasal pharynx → laryngeal pharynx → trachea
- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
- when intubating, the glottic opening is used as the space through which one visualizes proper placement of the ETT
- the trachea begins at the level of the thyroid cartilage at the level of C6
- the trachea bifurcates into the right and left main bronchi at the level of T5 (approximately at the sternal angle)

**Figure 4. Landmarks for intubation**

Table 3. Methods of Supporting the Airway

	Bag and Mask	Laryngeal Mask Airway (LMA)	Endotracheal Tube (ETT)
<b>Advantages/Indications</b>	<ul style="list-style-type: none"> <li>Basic</li> <li>Non-invasive</li> <li>Readily available</li> </ul>	<ul style="list-style-type: none"> <li>Easy to insert</li> <li>Less airway trauma/irritation than ETT</li> <li>Frees up hands (vs. face mask)</li> <li>Primarily used in spontaneously ventilating patient</li> </ul>	Indications for intubation (5 Ps): <ul style="list-style-type: none"> <li>Patent airway</li> <li>Protects against aspiration</li> <li>Positive pressure ventilation</li> <li>Pulmonary toilet (suction)</li> <li>Pharmacologic administration also hemodynamic instability</li> </ul>
<b>Disadvantages/Contraindications</b>	<ul style="list-style-type: none"> <li>Risk of aspiration if decreased LOC</li> <li>Cannot ensure airway patency</li> <li>Inability to deliver precise tidal volume</li> <li>Operator fatigue</li> </ul>	<ul style="list-style-type: none"> <li>Risk of gastric aspiration</li> <li>PPV &lt;20 cm H<sub>2</sub>O needed</li> <li>Oropharyngeal/retropharyngeal pathology or foreign body</li> </ul>	<ul style="list-style-type: none"> <li>Insertion can be difficult</li> <li>Muscle relaxant usually needed</li> <li>Most invasive – see <i>Complications During Laryngoscopy and Intubation</i>, A9</li> </ul>
<b>Other</b>	<ul style="list-style-type: none"> <li>Facilitate airway patency with jaw thrust and chin lift</li> <li>Can use oropharyngeal/nasopharyngeal airway</li> </ul>	<ul style="list-style-type: none"> <li>Does NOT protect against laryngospasm or gastric aspiration</li> <li>Sizing by body weight (approx):               <ul style="list-style-type: none"> <li>40-50 kg: 3</li> <li>50-70 kg: 4</li> <li>70-100 kg: 5</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Auscultate to avoid endobronchial intubation</li> <li>Sizing (approx):               <ul style="list-style-type: none"> <li>Male: 8.0-9.0 mm</li> <li>Female: 7.0-8.0 mm</li> <li>Pediatric: (age/4) + 4 mm</li> </ul> </li> </ul>

#### Suspect Difficult Bag-Mask Ventilation with:

##### BONES

Beard  
Obesity/Obstetrics  
No teeth  
Elderly  
Sleep apnea

#### Equipment for Intubation

##### MDSOLES

Monitors  
Drugs  
Suction  
Oxygen source and self-inflating bag with oropharyngeal and nasopharyngeal airways  
Laryngoscope  
Endotracheal tubes (appropriate size and one size smaller)  
Stylet, Syringe for tube cuff inflation

## Tracheal Intubation

### Preparing for Intubation

- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare and assess for potential difficulties (see *Pre-Operative Assessment*, A2)
- ensure equipment is available and working (e.g. test ETT cuff, check laryngoscope light, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O<sub>2</sub> for 3-5 min or for 4 vital capacity breaths
- may need to suction mouth and pharynx first

### Proper Positioning for Intubation

- “sniffing position”: flexion of lower C-spine (C5,6), i.e. bow head forward and extension of upper C-spine at atlanto (C1)-occipital joint, i.e. nose in the air
  - contraindicated in known/suspected C-spine fracture/instability
- aligns the three axes of mouth, pharynx and larynx to allow visualization from the oral cavity to the glottis (Figure 5)
- proper position for laryngoscope tip to visualize cords is in the epiglottic vallecula
- contraindicated in known/suspected C-spine fracture/instability

### Tube Insertion

- ETT insertion can incite a significant sympathetic response due to a “foreign body reflex” in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
  - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - if too shallow, may lead to accidental extubation, vocal cord trauma or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
  - approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women

### Confirmation of Tracheal Placement of ETT

- direct
  - visualization of ETT passing through cords
  - bronchoscopic visualization of ETT in trachea
- indirect
  - ET<sub>CO2</sub> in exhaled gas measured by capnography
  - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - bilateral chest movement, condensation of water vapour in ETT visible during exhalation and no abdominal distention
  - refilling of reservoir bag during exhalation
  - CXR (rarely done): ETT tip at midpoint of thoracic inlet and carina (lateral CXR more sensitive and specific)
- esophageal intubation suspected when
  - ET<sub>CO2</sub> zero or near zero on capnograph

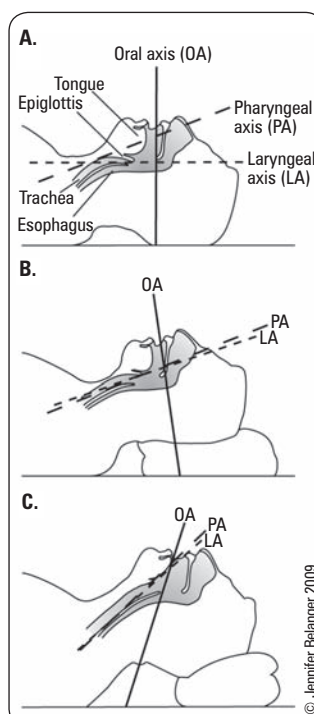

Figure 5. Anatomic considerations in laryngoscopy

- A. Neutral position  
B. C-spine flexion  
C. C-spine flexion with atlanto-occipital extension

- abnormal sounds during assisted ventilation
- impairment of chest excursion
- hypoxia/cyanosis
- presence of gastric contents in ETT
- distention of stomach/epigastrium with ventilation

### Complications During Laryngoscopy and Intubation

- dental damage
- laceration (lips, gums, tongue, pharynx, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation
- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see *Extubation*, A17 for definition)
- bronchospasm

## Routine Induction vs. Rapid Sequence Induction (RSI)

- RSI is indicated in patients at risk of regurgitation/aspiration (see *Aspiration*, A5)

Table 4. Comparison of Routine Induction vs. RSI

Steps	Routine Induction	RSI
1. Equipment Preparation	Check equipment, drugs, suction, and monitors. Prepare an alternative laryngoscope blade and a second ETT tube one size smaller	Check equipment, drugs, suction, and monitors. Prepare an alternative laryngoscope blade and a second ETT tube one size smaller
2. Pre-Oxygenation/Denitrogenation	100% O <sub>2</sub> for 3 min or 4 vital capacity breaths	100% O <sub>2</sub> for 3 min or 4 vital capacity breaths
3. Pre-Treatment Agents	Use agent of choice to blunt physiologic responses to airway manipulation 3 min prior to laryngoscopy	Use agent of choice to blunt physiologic responses to airway manipulation. If possible, give 3 min prior to laryngoscopy but can skip this step in an emergent situation.
3. Induction Agents	Use IV or inhalation induction agent of choice	Use fast acting induction agent of choice
4. Muscle Relaxants	Muscle relaxant of choice given after the onset of the induction agent	Fast acting muscle relaxant (e.g. SCh) given IMMEDIATELY after induction agent
5. Ventilation	Bag-mask ventilation	DO NOT bag ventilate – can increase risk of aspiration
6. Cricoid Pressure	Backwards upwards rightwards pressure (BURP) to assist visualization if indicated	Sellick maneuver, also known as cricoid pressure, to prevent regurgitation and assist in visualization (2 kg pressure with drowsiness, 3 kg with loss of consciousness)
7. Intubation	Intubate, inflate cuff, confirm ETT position	Intubate once paralyzed (~45 s after SCh given), inflate cuff, confirm ETT position. Cricoid pressure maintained until ETT cuff inflated and placement confirmed
8. Secure Machines	Secure ETT, and begin manual/machine ventilation	Secure ETT, and begin manual/machine ventilation

## Difficult Airway

- difficulties with bag-mask ventilation, supraglottic airway, endotracheal intubation, infraglottic airway or surgical airway
- algorithms exist for difficult airways (e.g. *Anesthesiology* 2003;98:3273, *Anaesthesia* 2004;59:675)
- pre-op assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- if difficult airway expected, consider:
  - awake intubation
  - intubating with bronchoscope, trachlight (lighted stylet), fibre optic laryngoscope, glidescope, etc.

### Medications that can be given through the ETT

#### NAVEL

Naloxone  
Atropine  
Ventolin  
Epinephrine  
Lidocaine

### Differential Diagnosis of Poor Bilateral Breath Sounds after Intubation

#### DOPE

Displaced ETT  
Obstruction  
Pneumothorax  
Esophageal intubation

### Predicting Difficult Intubation in Apparently Normal Patients

*Anesth* 2005;103:429-437

**Purpose:** To assess widely available bedside tests and widely used laryngoscopic techniques in the prediction of difficult intubations.

**Study:** Meta-analysis.

**Patients:** 35 studies encompassing 50,760 patients.

**Definitions:** Difficult intubation was defined usually as Cormack-Lehane grade of 3 or greater, but some authors reported the requirement of a special technique, multiple unsuccessful attempts, or a combination of these as the accepted standard for difficult intubation.

**Results:** The overall incidence of difficult intubation was 5.8% (95% CI, 4.5–7.5%) for the overall patient population, 6.2% (95% CI, 4.6–8.3%) for normal patients excluding obstetric and obese patients, 3.1% (95% CI, 1.7–5.5%) for obstetric patients and 15.8% (95% CI, 14.3–17.5%) for obese patients. Mallampati score: SN:49% SP:86% PLR:3.7 NLR:0.5; Thyromental distance: SN:20% SP:94% PLR:3.4 NLR:0.8; Sternomental distance: SN:62% SP:82% PLR:5.7 NLR:0.5; Mouth opening: SN:22% SP:97% PLR:4.0 NLR:0.8; Wilson risk-sum: SN:46% SP:89% PLR:5.8 NLR:0.6; Combination Mallampati and thyromental distance: SN:36% SP:87% PLR:9.9 NLR:0.6.

**Conclusions:** A combination of the Mallampati score and thyromental distance is the most accurate at predicting difficult intubation. The PLR (9.9) is supportive of the test as a good predictor of difficult intubation.

**PLR:** Positive likelihood ratio; **NLR:** Negative likelihood ratio; **SN:** Sensitivity; **SP:** Specificity

- if intubation unsuccessful after induction:
  1. CALL FOR HELP
  2. ventilate with 100% O<sub>2</sub> via bag and mask
  3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate:
  1. CALL FOR HELP
  2. attempt ventilation with oral airway
  3. consider/attempt LMA
  4. emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy or tracheostomy)

## Intraoperative Management

### Oxygen Therapy

- in general, the goal of oxygen therapy is to maintain oxygen saturation (SaO<sub>2</sub>) >90%
- below an SaO<sub>2</sub> of 90%, a small decrease in saturation corresponds to a large drop in PaO<sub>2</sub>
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements (FiO<sub>2</sub>) and the degree to which precise control of delivery is needed
- cyanosis can be detected at SaO<sub>2</sub> <85%, frank cyanosis at SaO<sub>2</sub> = 67%

#### Low Flow Systems

- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25, consistent ventilation pattern
- provide O<sub>2</sub> at flows between 0-10 L/min
- dilution of oxygen with room air results in a decrease in FiO<sub>2</sub>
- an increase in minute ventilation (tidal volume x RR) results in a decrease in FiO<sub>2</sub>
- e.g. nasal canula (prong)
  - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
  - nasopharynx acts as an anatomic reservoir that collects O<sub>2</sub>
  - delivered oxygen concentration (FiO<sub>2</sub>) can be estimated by adding 4% for every additional litre of O<sub>2</sub> delivered (e.g. at normal tidal volume and RR, flow rate of 1-6 L/min equates to FiO<sub>2</sub> of 24-44%)

#### Reservoir Systems

- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask (Hudson face mask)
  - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore O<sub>2</sub> tubing at a rate of at least 6 L/min to ensure that exhaled CO<sub>2</sub> is flushed through the exhalation ports and not rebreathed
  - FiO<sub>2</sub> of 55% can be achieved at O<sub>2</sub> flow rates of 10 L/min
- non-rebreather mask
  - reservoir bag and a series of one-way valves direct gas flow from the bag on inhalation and allow release of expired gases on exhalation, thus allowing for oxygen accumulation during intubation
  - O<sub>2</sub> flow rates of 10-15 L/min are needed to maintain the reservoir bag inflation and should deliver FiO<sub>2</sub> >80%

#### High Flow Systems

- generates flows of up to 50-60 L/min
- meets/exceeds patient's inspiratory flow requirement
- delivers consistent and predictable concentration of O<sub>2</sub>
- Venturi mask
  - delivers specific percentages of oxygen by varying the size of air entrainment
  - port determines the oxygen concentration (i.e. can vary to achieve 24%, 28%, 35%, 50%)
  - enables control of gas humidity
- Puritan mask
  - delivers the highest level of humidified oxygen

## Ventilation

- in patients given muscle relaxants, ventilation is maintained with PPV
- if no muscle relaxant is given, patients may have sufficient spontaneous respirations to maintain ventilation or assisted/controlled ventilation can be used
- other indications for mechanical ventilation:
  - apnea
  - hypoventilation
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)

Figure 6. HbO<sub>2</sub> saturation curve

#### Alveolar O<sub>2</sub> Gas Equation

$$PAO_2 = FiO_2 (P_{atm} - P_{H_2O}) - (PaCO_2/RQ)$$

Where respiratory quotient (RQ) = 0.8

#### Arterial O<sub>2</sub> Content

$$CaO_2 = (SaO_2)(Hb)(1.34) + (PaO_2)(0.003)$$

CaO<sub>2</sub> = arterial O<sub>2</sub> content

SaO<sub>2</sub> = % hemoglobin saturation

PaO<sub>2</sub> = arterial O<sub>2</sub> pressure

RQ = respiratory quotient

- deliver positive end expiratory pressure (PEEP)
- increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation:
  - decreased CO<sub>2</sub> due to hyperventilation
  - decreased BP due to decreased venous return from increased intrathoracic pressure
  - alkalemia with over correction of chronic hypercarbia
  - nosocomial pneumonia/bronchitis
- see [Respirology](#), R26 for ventilatory modes

### Causes of Hypocapnea (decreased CO<sub>2</sub>)

- hyperventilation
- hypothermia (decreased metabolic rate)
- decreased pulmonary blood flow (e.g. decreased cardiac output)
- incorrect placement of sampling catheter
- inadequate sampling volume
- V/Q mismatch
  - pulmonary thromboembolism
  - incipient pulmonary edema
  - air embolism

### Causes of Hypercapnea (increased CO<sub>2</sub>)

- hypoventilation
- hyperthermia
- improved pulmonary blood flow after resuscitation or hypotension
- low bicarbonate
- water in capnography device
- anesthetic breathing circuit error
  - inadequate fresh gas flow
  - rebreathing
  - exhausted soda lime
  - faulty circuit absorber valves

#### Causes of Intraoperative Hypoxia

**Inadequate oxygen supply:** e.g. breathing system disconnection, obstructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply.

#### Hypoventilation

**Ventilation-perfusion inequalities:** e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax.

**Reduction in oxygen carrying capacity:** e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy.

**Leftward shift of the hemoglobin-oxygen saturation curve:** e.g. hypothermia, decreased 2,3-DPG, alkalosis, hypocarbia, carbon monoxide poisoning.

#### Right-to-left cardiac shunt

#### Hypothermia (32°-35.9°C) Impact on Outcomes

**Increased** risk of wound infections due to impaired immune function.

**Increases** the period of hospitalization by delaying healing.

**Reduces** platelet function and impairs activation of coagulation cascade increasing blood loss and transfusion requirements.

**Triplies** the incidence of VT and morbid cardiac events.

**Decreases** the metabolism of anesthetic agents prolonging post-op recovery.

## Temperature

### Causes of Hypothermia (<36.0°C)

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to:
  - OR environment (cold room, IV fluids, instruments)
  - open wound
- prevent with inflated warming blanket and warmed IV fluids (if giving platelet transfusion, put through a line that does not go through warmer because warmer distorts viability of platelets)

### Causes of Hyperthermia (>37.5-38.3°C)

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see *Uncommon Complications*, A24)
- over-zealous warming efforts

## Heart Rate

### Cardiac Arrest

- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclude all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts):
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
- for management of cardiac arrest, see *ACLS Guidelines* (Figure 13), A28

### Intraoperative Tachycardia

- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
- SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
- wide complex tachycardia: VT, SVT with aberrant conduction

- causes of sinus tachycardia:
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia
  - febrile illness/sepsis
  - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium)
  - Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see *ACLS Guidelines* (Figure 14), A29

### Intraoperative Bradycardia

- bradycardia = HR <50 bpm; most concerning are 2nd degree (Type 2 Mobitz) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia:
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see [Cardiology and Cardiovascular Surgery](#), C12)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. SCH, opioids, edrophonium, neostigmine, halothane, digoxin,  $\beta$ -blockers)
  - high spinal/epidural anesthesia
- for management of bradycardia, see *ACLS Guidelines* (Figure 15), A29

### Intraoperative Shock

**SHOCKED**  
 Sepsis or Spinal shock  
 Hypovolemic/Hemorrhagic  
 Obstructive  
 Cardiogenic  
 anaphylactic  
 Extra/other  
 Drugs

$BP = CO \times SVR$ , where  $CO = SV \times HR$

SV is a function of preload, afterload, and contractility

## Blood Pressure

### Causes of Intraoperative Hypotension/Shock (sBP <90 mmHg or MAP <60 mmHg)

- a) hypovolemic/hemorrhagic shock
- most common form of shock, due to blood loss or dehydration

**Table 5. Assessment of Hemorrhagic Shock**

	Class I	Class II	Class III	Class IV
Percentage blood loss	0-15%	15-30%	30-40%	>40%
Percentage TBW loss	0-3%	3-6%	6-9%	>9%
Heart rate	<100	>100	>120	>140
Blood pressure	Normal	Normal	Decreased	Decreased
Treatment	Rapid infusion of 1-2 L of crystalloid (e.g. Ringer's lactate), maintenance fluids	Rapid infusion of 2 L of crystalloid and re-evaluate	Rapid infusion of 2 L of crystalloid, replace losses with crystalloid (1:3) or pRBCs, colloid (1:1)	Rapid infusion of 2 L of crystalloid, replace losses with crystalloid (1:3) or pRBCs, colloid (1:1)
Note			Goal is to maintain urine output at >0.5 mL/kg/h	Goal is to maintain urine output at >0.5 mL/kg/h

- b) obstructive shock
- obstruction of blood into or out of the heart
  - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
  - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism
- c) cardiogenic shock
- myocardial dysfunction
  - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
  - e.g. dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
- d) septic shock
- see [Infectious Diseases](#), ID22
  - bacterial, viral, fungal, endotoxins/mediators cause vasodilation and capillary leakage
  - associated with contamination of open wounds, intestinal injury or penetrating trauma
  - fever, decreased JVP, wide pulse pressure, increased CO, increased HR, decreased systemic vascular resistance  $\pm$  pressors
  - initial treatment: antibiotics, volume expansion
- e) spinal/neurogenic shock
- decreased sympathetic tone
  - hypotension without tachycardia or peripheral vasoconstriction (warm skin)
- f) anaphylactic shock
- see [Emergency Medicine](#), ER30
  - acute/subacute generalized allergic reaction due to an inappropriate or excessive immune response (type I hypersensitivity)

- treatment of anaphylactic shock:
  - ♦ moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
    - epinephrine (1:1000) 0.3-0.5 mg SC
    - antihistamines: diphenhydramine (Benadryl®) 25-50 mg IM
    - salbutamol (Ventolin®) 1 cc via nebulizer
  - ♦ severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
    - ABCs, may need ETT due to airway edema
    - epinephrine (1:1000) 0.1-0.3 mg IV (or via ETT if no IV access) to start, repeat as needed
    - antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
    - steroids: hydrocortisone (Solucortef®) 100 mg IV (~1.5 mg/kg) or methylprednisolone (Solumedrol®) 1 mg/kg IV q6h x 24 h
    - large volumes of crystalloid may be required

## g) drugs

- vasodilators, high spinal anesthetic interfering with sympathetic outflow

## h) other

- transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aorticaval syndrome
- see [Hematology](#), H52 and [Endocrinology](#), E35, E22, E26

**Causes of Intraoperative Hypertension**

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine)
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome (see [Psychiatry](#), PS43), thyroid storm, pheochromocytoma (see [Endocrinology](#), E25, E36)

**Fluid Balance and Resuscitation**

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings this formula must take into account multiple factors including pre-operative fasting/decreased fluid intake, increased losses during or before surgery, fluid shifting during surgery, fluids given with blood products and medications

**What is the Maintenance?**

- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres and CHF
- 4:2:1 rule to calculate maintenance requirements (applies to crystalloids only)
  - 4 mL/kg/h first 10 kg
  - 2 mL/kg/h second 10 kg
  - 1 mL/kg/h for remaining weight >20 kg
- maintenance electrolytes
  - Na<sup>+</sup>: 3 mEq/kg/d
  - K<sup>+</sup>: 1 mEq/kg/d
- e.g. 50 kg patient maintenance requirements
  - fluid = 40 + 20 + 30 = 90 mL/h = 2160 mL/d = 2.16 L/d
  - Na<sup>+</sup> = 150 mEq/d (therefore 150 mEq / 2.16 L/d ≈ 69 mEq/L)
  - K<sup>+</sup> = 50 mEq/d (therefore 50 mEq / 2.16 L/d ≈ 23 mEq/L)
- above patient's requirements roughly met with 2/3 D5W, 1/3 NS
  - e.g. 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre

**Figure 7. Total body water division in a 70 kg adult**

**What is the Deficit?**

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na<sup>+</sup> content determines ECF volume; [Na<sup>+</sup>] determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal Na<sup>+</sup> loss
    - ♦ GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - ♦ skin/resp: insensible losses (fever), sweating, burns
    - ♦ vascular: hemorrhage

- renal Na<sup>+</sup> and H<sub>2</sub>O loss
  - ♦ diuretics
  - ♦ osmotic diuresis
  - ♦ hypoaldosteronism
  - ♦ salt-wasting nephropathies
- renal H<sub>2</sub>O loss
  - ♦ diabetes insipidus (central or nephrogenic)
- hypovolemia with normal or expanded ECF volume
  - ♦ decreased CO
  - ♦ redistribution
    - hypoalbuminemia: cirrhosis, nephrotic syndrome
    - capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

**Table 6. Signs and Symptoms of Dehydration**

Percentage of Body Water Loss	Severity	Signs and Symptoms
3%	Mild	Decreased skin turgor, sunken eyes, dry mucous membranes, dry tongue, reduced sweating
6%	Moderate	Oliguria, orthostatic hypotension, tachycardia, low volume pulse, cool extremities, reduced filling of peripheral veins and CVP, hemoconcentration, apathy
9%	Severe	Profound oliguria or anuria and compromised CNS function with or without altered sensorium

**What are the Ongoing Losses?**

- tubes
  - Foley catheter, NG, surgical drains
- third spacing (other than ECF, ICF)
  - pleura, GI, retroperitoneal, peritoneal
  - evaporation via exposed viscera, burns
- blood loss
- ongoing loss due to surgical exposure and evaporative losses

**IV Fluids**

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O<sub>2</sub> carrying capacity of blood

**Crystalloid Infusion**

- salt-containing solutions that distribute within ECF
- maintain euolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement). Controversy surrounds this as an initial vs. maximal replacement target
- if large volumes are to be given, use balanced fluids such as Ringer's lactate or Plasmalyte®, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

**Colloid Infusion** (see *Blood Products*, A15)

- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (starches, e.g. hydroxyethyl starch (HES) and dextrans)
- distributes within intravascular volume
- 1:1 ratio (infusion: blood loss) only in terms of replacing intravascular volume
- HES colloids remain in intravascular space (metabolized by plasma serum amylase and renally excreted); two available in Canada: Voluven® and Pentaspan®
- beware of coagulopathy with large volume colloid infusions

**Table 7. Colloid HES Solutions**

	Concentration	Plasma Volume Expansion	Duration (h)	Maximum Daily Dose (mL/kg)
Voluven®	6%	1:1	4-6	33-50
Pentaspan®	10%	1:1.2-1.5	18-24	28

**Initial Distribution of IV Fluids**

- H<sub>2</sub>O follows ions/molecules to their respective compartments

**Colloids versus Crystalloids for Fluid Resuscitation in Critically Ill Patients**

*Cochrane DB Syst Rev 2012;6:CD000567*

**Purpose:** To evaluate the effects of colloids compared to crystalloids for fluid resuscitation, specifically when used in critically ill patients.

**Methods:** A meta-analysis was performed looking at randomized controlled trials comparing colloid vs. crystalloid use in patients requiring volume replacement. Pregnant women and neonates were excluded. Primary outcome was overall mortality.

**Results:** Results were broken down based on specific colloid. For albumin (or plasma protein fraction) the relative risk (RR) was 1.01 (95% CI 0.93-1.10) as compared to crystalloid. For hydroxyethyl starch the RR was 1.10 (95% CI 0.91-1.32). Modified gelatin had a RR of 0.91 (95% CI 0.49-1.72) and Dextran had a RR of 1.24 (95% CI 0.94-1.65). For colloids mixed in a hypertonic crystalloid as compared to isotonic crystalloid the RR was 0.88 (91% CI 0.71-1.06).

**Conclusions:** There is no evidence that use of colloids improves survival in trauma patients, burn patients or post-operative patients when compared to crystalloid solutions. Given the increased cost of colloids as compared to crystalloids, it is recommended that crystalloids be the fluid of choice in these patients.

Table 8. IV Fluid Solutions

		ECF	Ringer's Lactate	0.9% NS	0.45% NS in D5W	D5W	2/3 D5W + 1/3 NS	Plasmalyte
mEq/L	Na <sup>+</sup>	142	130	154	77	-	51	140
	K <sup>+</sup>	4	4	-	-	-	-	5
	Ca <sup>2+</sup>	4	3	-	-	-	-	-
	Mg <sup>2+</sup>	3	-	-	-	-	-	3

## Blood Products

- see [Hematology](#), H50

### Red Blood Cells (RBCs)

- 1U RBCs = approx. 300 mL
- 1U RBCs increases Hb by 10 g/L in a 70 kg patient
- RBCs may be diluted with colloid/crystalloid to decrease viscosity
- decision to transfuse based on initial blood volume, premonitory Hb level, present volume status, expected further blood loss, patient health status, patient consent
- massive transfusion = >1 x blood volume/24 h

### Autologous RBCs

- replacement of blood volume with one's own RBCs
- may decrease complications (infectious, febrile, etc.)
- alternative to homologous transfusion in elective procedures, but only if adequate Hb and no infection
- pre-op phlebotomy prior to elective surgery (up to 3U collected 3-5 wk before surgery)
- intraoperative salvage and filtration (cell saver); contraindicated in contaminated (e.g. bowel, abscess) or cancer cases

### Non-RBC Products

- fresh frozen plasma (FFP)
  - contains all plasma clotting factors and fibrinogen close to normal plasma levels
  - to prevent/treat bleeding due to coagulation factor depletion/deficiencies, liver impairment
- cryoprecipitate
  - contains Factors VIII and XIII, von Willebrand Factor (vWF), fibrinogen
- platelets
  - used in thrombocytopenia, massive transfusions, impaired platelet function
- albumin
  - selective intravascular volume expander
- erythropoietin
  - can be used pre-operatively to stimulate erythropoiesis

### Complications Due to Transfusion

- infectious risks: HIV, hepatitis B/C, Epstein-Barr virus (EBV), cytomegalovirus (CMV), brucellosis, malaria, salmonellosis, measles, syphilis
- hypervolemia
- electrolyte changes: increased K<sup>+</sup> in stored blood
- dilutional coagulopathy
- dilutional thrombocytopenia
- hypothermia
- citrate toxicity
- hypocalcemia
- iron overload
- transfusion-related immunosuppression: peri-operative transfusion may be associated with increased risk of post-operative infection, increased short-term mortality and possible cancer recurrence
- see [Hematology](#), H52 for list of transfusion reactions

#### Calculating Acceptable Blood Losses (ABL)

- Blood volume
  - term infant 80 mL/kg
  - adult male 70 mL/kg
  - adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
 
$$EBV = 70 \text{ kg} \times 70 \text{ mL/kg} = 4900 \text{ mL}$$
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion, (e.g. 70 g/L for a person with Hb(i) = 150 g/L)
 
$$Hb(f) = 70 \text{ g/L}$$
- Calculate
 
$$ABL = \frac{Hct(Hi) - Hct(Hf)}{Hct(Hi)} \times EBV$$

$$= \frac{150 - 70}{150} \times 4900$$

$$= 2613 \text{ mL}$$
- Therefore in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost.

Table 9. Immune Transfusion Reactions

Reaction	Risk	Cause	Presentation	Management
<b>Non-Hemolytic: Febrile</b>	1 in 100	<ul style="list-style-type: none"> <li>Alloantibodies to WBC, platelet, or other donor plasma antigens</li> </ul>	<ul style="list-style-type: none"> <li>Mild fever &lt;38°C with or without rigors; may be &gt;38°C with restlessness and shivering</li> <li>Nausea, facial flushing, headache, myalgias, hypotension, chest and back pain</li> <li>Occurs quickly; near completion of transfusion or within 2 h</li> </ul>	<ul style="list-style-type: none"> <li>Rule out fever due to hemolytic reaction or bacterial contamination</li> <li>Mild (&lt;38°C): decrease infusion rate and give antipyretics</li> <li>Severe: stop transfusion, give antipyretics, antihistamines and symptomatic treatment</li> </ul>
<b>Non-Hemolytic: Allergic</b>	1 in 100	<ul style="list-style-type: none"> <li>Mild allergic reaction due to IgE alloantibodies to substances in donor plasma</li> <li>Mast cells activated with histamine release</li> <li>Usually occurs in pre-exposed (e.g. multiple transfusions, multiparous)</li> </ul>	<ul style="list-style-type: none"> <li>Often have history of similar reactions</li> <li>Abrupt onset of pruritic erythema/urticaria on arms and trunk, occasionally with fever</li> <li>Less common: involvement of face, larynx and bronchioles</li> </ul>	<ul style="list-style-type: none"> <li>Mild: slow transfusion rate, IV antihistamines</li> <li>Moderate to severe: stop transfusion, IV antihistamines, subcutaneous epinephrine, hydrocortisone, IV fluids, bronchodilators</li> <li>Prophylactic: antihistamines 15-60 min prior to transfusion, washed or deglycerolized frozen RBC</li> </ul>
<b>Non-Hemolytic: Anaphylactoid</b>	<1 in 10 000	<ul style="list-style-type: none"> <li>In IgA deficient patients with anti-IgA antibodies receiving IgA-containing blood</li> <li>Immune complexes activate mast cells, basophils, eosinophils and complement system = severe symptoms after transfusion of RBC, plasma, platelets, or other components with IgA</li> </ul>	<ul style="list-style-type: none"> <li>Rare, potentially lethal</li> <li>Apprehension, urticarial eruptions, dyspnea, hypotension, laryngeal and airway edema, wheezing, chest pain, shock, sudden death</li> </ul>	<ul style="list-style-type: none"> <li>Circulatory support with fluids, catecholamines (epinephrine), bronchodilators</li> <li>Respiratory assistance as indicated</li> <li>Evaluate for IgA deficiency and anti-IgA antibodies</li> <li>Future transfusions must be free of IgA: washed/deglycerolized RBCs free of IgA, blood from IgA deficient donor</li> </ul>
<b>Transfusion Related Acute Lung Injury (TRALI)</b>	1 in 5000	<ul style="list-style-type: none"> <li>Form of noncardiogenic pulmonary edema</li> <li>Immunologic cause; not due to fluid overload or cardiac failure</li> <li>Binding of donor Ab against recipient WBC causing cytokine release leading to increased capillary permeability</li> </ul>	<ul style="list-style-type: none"> <li>Occurs 2-4 h post transfusion</li> <li>Respiratory distress: mild dyspnea to severe hypoxia</li> <li>Chest x-ray: consistent with acute pulmonary edema, but pulmonary artery and wedge pressures are not elevated</li> </ul>	<ul style="list-style-type: none"> <li>Usually resolves within 48 h with O<sub>2</sub>, mechanical ventilation, supportive treatment</li> </ul>
<b>Hemolytic: Acute (intravascular hemolysis)</b>	<1 in 40,000	<ul style="list-style-type: none"> <li>Caused by donor incompatibility with recipient's blood</li> <li>Often due to clerical error</li> <li>Antibody coated RBC is destroyed by activation of complement system</li> <li>ABO incompatibility is a common cause; other RBC Ag-Ab systems can be involved</li> </ul>	<ul style="list-style-type: none"> <li>Fever, chills, chest or back pain, hypotension, tachycardia, nausea, flushing, dyspnea, wheezing, hypoxemia, hemoglobinuria, diffuse bleeding due to DIC, acute renal failure</li> </ul>	<ul style="list-style-type: none"> <li>Stop transfusion</li> <li>Notify blood bank, confirm or rule out diagnosis – clerical check, direct Coombs, repeat grouping, Rh screen and crossmatch, serum haptoglobin</li> <li>Manage hypotension with fluids, inotropes, other blood products</li> <li>Maintain urine output with crystalloids, furosemide, dopamine, alkalize urine</li> <li>Component treatment if DIC, repeat grouping, Rh screen and crossmatch, serum haptoglobin</li> <li>Manage hypotension with fluids, inotropes, other blood products</li> <li>Component treatment (e.g. FFP, cryoprecipitate)</li> </ul>
<b>Hemolytic: Delayed (extravascular hemolysis)</b>	<1 in 7500	<ul style="list-style-type: none"> <li>Caused by donor incompatibility with recipient's blood</li> <li>Generally mild, caused by antibodies to Rh, Kell, Duffy, or Kidd antigens</li> <li>The level of antibody at the time of transfusion is too low to be detected or to cause hemolysis, later the level of antibody is increased due to secondary stimulus</li> </ul>	<ul style="list-style-type: none"> <li>Occurs in recipients sensitized to RBC antigens by previous blood transfusion or pregnancy</li> <li>Anemia, mild jaundice, fever 1-21 d post-transfusion</li> </ul>	<ul style="list-style-type: none"> <li>Supportive</li> <li>Direct Coombs, re-examination of pretransfusion specimens from the patient and donor for diagnosis</li> </ul>

## Transfusion Infection Risks

Virus	Risk per 1 unit pRBCs
HIV	1 in 8-12 million
Hepatitis C virus	1 in 5-7 million
Hepatitis B virus	1 in 1.1-1.7 million
HTLV	1 in 1-1.3 million
Syphilis	<1 in 100 million
West Nile virus	No cases since 2003

Transfusion and risk of infection in Canada: Update 2012.

*Paediatr Child Health* 2012;17:e102-e111

## A Multicenter, Randomized, Controlled Clinical Trial of Transfusion Requirements in Critical Care

*NEJM* 1999;340:409-417

**Purpose:** To determine whether a restrictive strategy of RBC transfusion and a liberal strategy produce equivalent results in critically ill patients. **Study:** Randomized controlled trial with 60 d follow-up.

**Patients:** 838 critically ill patients with euvoolemia after initial treatment who had Hb concentrations of <90 g/L within 72 h after admission to the ICU. Mean age 57.5 yr, 62.5% male.

**Intervention:** Patients were randomly assigned to either a restrictive strategy of transfusion, in which RBCs were transfused if the Hb dropped <70 g/L and Hb concentrations were maintained between 70-90 g/L, or to a liberal strategy, in which transfusions were given when the Hb dropped <100 g/L and Hb concentrations were maintained between 100-120 g/L.

**Main Outcomes:** All cause mortality rates at 30 d and 60 d, mortality rates during the stay in ICU and hospitalization, survival times during the first 30 d and rates of organ failure and dysfunction.

**Results:** Overall, 30 d mortality was similar in the two groups. However, the rates were significantly lower with the restrictive transfusion strategy among patients who were less acutely ill (8.7% vs. 16.1%) and who were less than 55 yr of age (5.7% vs. 13%), but not among patients with clinically significant cardiac disease.

The mortality rate during hospitalization was significantly lower in the restrictive strategy group (22.2% vs. 28.1%).

**Conclusions:** With the possible exception of patients with acute MI and unstable angina, a restrictive strategy of RBC transfusion is as effective as, and possibly superior to, a liberal transfusion strategy in critically ill patients.

## Extubation

- performed by trained, experienced personnel because reintubation may be required
- criteria:
  - patient must no longer have intubation requirements (see Table 3, *Tracheal Intubation*, A8)
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- laryngospasm more likely in semiconscious patient; must ensure adequate LOC
- general guidelines:
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O<sub>2</sub> for 3-5 min
  - suction secretions from pharynx
  - deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O<sub>2</sub> delivery available
  - proper positioning of patient during transfer to recovery room (e.g. lateral decubitus, head elevated)

### Complications of Extubation

- early extubation
  - aspiration
  - laryngospasm
- late extubation
  - transient vocal cord incompetence
  - edema (glottic, subglottic)
  - pharyngitis, tracheitis

### Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (e.g. by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: bag-mask ventilation with 100% oxygen, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (0.25-1 mg/kg) and reintubation if hypoxia develops

## Post-Operative Care

- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home
- pain service may assist with management of post-operative inpatients

### Post-Operative Nausea and Vomiting (PONV)

- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), metoclopramide (Maxeran®) (not with bowel obstruction), prochlorperazine (Stemetil®), ondansetron (Zofran®), granisetron (Kytril®)

### Post-Operative Confusion and Agitation

- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (stroke, raised intracranial pressure)
- drug effect (ketamine, anticholinergics)
- elderly patients are more susceptible to post-operative delirium

#### Risk Factors for Post-Operative Nausea and Vomiting (PONV)

- Young age
- Female
- History of PONV
- Non-smoker
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: N<sub>2</sub>O, opioids, volatile agents

#### Drugs for Preventing Post-Operative Nausea and Vomiting

*Cochrane DB Syst Rev* 2006;3:CD004125

**Purpose:** To evaluate the efficacy of antiemetics in preventing PONV.

**Methods:** A meta-analysis was performed looking at randomized controlled trials comparing an antiemetic to either a second antiemetic or placebo. Trials looking at dosing and/or timing of medication administration were also included. PONV was used as the primary outcome.

**Results:** 737 studies involving 103,237 patients. Eight drugs significantly reduced the occurrence of PONV, namely: droperidol, metoclopramide, ondansetron, tropisetron, dolasetron, dexamethasone, cyclizine and granisetron. Relative risk (RR) versus placebo varied between 0.60 and 0.80. Side effects included a significant increase in drowsiness for droperidol (RR 1.32) and headache for ondansetron (RR 1.16). The cumulative number needed to treat was 3.57.

**Conclusion:** Antiemetic medication is effective for reducing the occurrence of PONV. However, further investigation needs to be done to determine whether antiemetics can cause more severe (and likely rare) side effects, which could alter how liberally they are used.

# Pain Management

## Definitions

- nociception: detection, transduction and transmission of noxious stimuli
- pain: perception of nociception which occurs in the brain

## Acute Pain

- pain of short duration (<6 wk) usually associated with surgery, trauma or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

Figure 9. Acute pain mechanism

## Pharmacological Management of Acute Pain

- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity

Table 10. Commonly Used Analgesics

	Acetaminophen	NSAIDs	Opioids
<b>Examples</b>	• Tylenol®	• Aspirin®, ibuprofen, naproxen • ketorolac (IV)	• Oral: codeine, oxycodone, morphine, hydromorphone • Parenteral: morphine, hydromorphone, fentanyl
<b>Indications</b>	• First-line for mild acute pain	• Mild-moderate pain	• Oral: moderate acute pain • Parenteral: moderate-severe acute pain
<b>Mechanism of Action</b>	• Unclear, hypothesized cyclooxygenase-2 (COX-2) inhibition • Unclear, maybe modulation of endogenous cannabinoid system	• Non-selective COX-1 and 2 inhibition reducing proinflammatory prostaglandin synthesis	• Dampens nociceptive transmission between 1 <sup>st</sup> and 2 <sup>nd</sup> order neurons in the dorsal horn • Activates ascending modulatory pathways resulting in release of inhibitory neurotransmitters • Inhibits peripheral inflammatory response and hyperalgesia • Affects mood and anxiety – alleviates the affective component of perceived pain
<b>Dosing/Administration</b>	• Limited by analgesic ceiling beyond which there is no additional analgesia • Opioid-sparing • Max dose of 4 g/24 h	• Limited by analgesic ceiling beyond which there is no additional analgesia • Opioid-sparing • Significant inter-individual variation in efficacy	• No analgesic ceiling (except for codeine) • Can be administered intrathecally (spinal block) or by continuous infusion
<b>Side Effects/Toxicity</b>	• Considered relatively safe • Liver toxicity in elevated doses	• Gastric ulceration/bleeding • Decreased renal perfusion • Photosensitivity • Premature closure of the ductus arteriosus in pregnancy	• Respiratory depression • Constipation and abdominal pain • Sedation • Nausea and vomiting • Pruritus • Confusion (particularly in the elderly) • Dependence

### Opioid Equivalency

- 10 mg morphine
- 100 mg codeine
- 5 mg oxycodone
- 2 mg hydromorphone

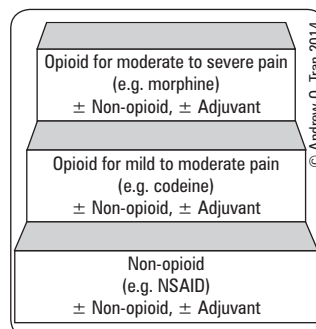

Figure 8. WHO analgesia ladder

### Use NSAIDs with Caution in Patients with:

- Asthma
- Coagulopathy
- GI ulcers
- Renal insufficiency
- Pregnancy, 3rd trimester

### Common Side Effects of Opioids

- Nausea and vomiting
- Constipation
- Sedation
- Pruritus
- Abdominal pain
- Urinary retention
- Respiratory depression

When prescribing opioids, consider:

- Breakthrough dose
- Anti-emetics
- Laxative

### PCA Parameters

- Loading dose
- Bolus dose
- Lockout interval
- Continuous infusion (optional)
- Maximum 4 h dose (limit)

### Advantages of PCA

- Improved patient satisfaction
- Fewer side effects
- Accommodates patient variability
- Accommodates changes in opioid requirements

- patient controlled analgesia (PCA)
  - involves the use of computerized pumps that can deliver a constant infusion as well as bolus breakthrough doses of parenterally-administered opioid analgesics
  - limited by lockout intervals
  - most commonly used agents: morphine and hydromorphone
  - refer to Table 14, A26 for suggested infusion rate, PCA dose and lockout intervals

### Opioid Antagonists (naloxone, naltrexone)

- opioid overdose manifests primarily at CNS (e.g. respiratory depression) – manage ABCs
- opioid antagonists competitively inhibit opioid receptors, predominantly  $\mu$  receptors
- naloxone is short-acting ( $t_{1/2} = 1$  h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
- naltrexone is longer-acting ( $t_{1/2} = 10$  h); less likely to see return of opioid effects
- relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, hypertension, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

### Neuropathic Pain

- pain caused by peripheral or central nervous system injury, often described as burning, lancinating, shooting, or tingling
- results in allodynia (pain in response to normally painless stimuli) or hyperalgesia (increased sensitivity to painful stimuli)
- consider adding anticonvulsants (gabapentin, pregabalin) or low-dose tricyclic antidepressant as opioids are ineffective

### Chronic Pain

- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- in the peri-operative period, consider continuing regular long-acting analgesics, and augmenting with regional techniques, adjuvants, additional opioid analgesia, and non-pharmacological techniques

#### Patient Controlled Opioid Analgesia versus Conventional Opioid Analgesia for Postoperative Pain

Cochrane DB Syst Rev 2006;4:CD003348

**Purpose:** To evaluate the efficacy of patient controlled analgesia (PCA) as compared to conventional 'as-needed' analgesia administration providing pain relief in post-operative patients.

**Methods:** Meta-analyses of randomized controlled trials comparing PCA vs. conventional administration of opioid analgesia. Assessment employed a visual analog scale (VAS) for pain intensity along with overall analgesic consumption, patient satisfaction, length of stay and adverse side effects.

**Results:** 55 studies with a total of 2023 patients receiving PCA and 1838 patients with standard as-needed opioid administration. PCA provided significantly better pain control through 72 h post-operatively, but patients consumed significantly more opioids ( $> 7$  mg morphine/24 h,  $P < 0.05$ ). Significantly more patients reported pruritus in the PCA group compared to control with a number needed to harm of 13. No significant difference in overall length of stay in hospital, sedation level, nausea/vomiting or urinary retention.

**Conclusions:** PCA is more effective than standard as-needed administration for reducing post-operative pain. However, patients using PCA consume more opioids overall and have more pruritus.

## Regional Anesthesia

### Definition of Regional Anesthesia

- local anesthetic agent (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

### Preparation for Regional Anesthesia

#### Patient Preparation

- thorough pre-operative evaluation and assessment of patient
- technique explained to patient
- sedation may be indicated before block
- monitoring should be as extensive as for general anesthesia

#### Relative Indications for Regional Anesthesia

- avoids some of the dangers of general anesthesia (e.g. known difficult intubation, severe respiratory failure, etc.)
- patient specifically requests regional anesthesia
- high quality post-operative pain relief
- general anesthesia not available/contraindicated
- titration of LA dosage for differential blockade (e.g. can block pain but preserve motor function)

#### Complications of Regional Anesthesia

- failure of technique/inadequate anesthesia
- unintentional total spinal anesthesia
- systemic drug toxicity due to overdose or intravascular injection (leading to CNS and CVS complications)
- injury to nerve root/spinal cord (nerve deficit), to epidural vein (hematoma), to peripheral nerve (intraneural injection)
- infection (e.g. osteitis, epidural abscess, meningitis)
- spinal and epidural: sympathetic blockade causing hypotension and bradycardia (occurs early, followed by sensory then motor blockade)
- post-dural puncture headache

#### Benefits of Regional Anesthesia

- Reduced peri-op pulmonary complications
- Reduced peri-op analgesia requirements
- Decreased PONV
- Reduced peri-op blood loss
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE

## Epidural and Spinal Anesthesia

### Anatomy of Spinal/Epidural Area

- spinal cord extends to L2, dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

**Table 11. Epidural versus Spinal Anesthesia**

	Epidural	Spinal
<b>Deposition Site</b>	LA injected in epidural space (space between ligamentum flavum and dura) Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura	LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots
<b>Onset</b>	Significant blockade requires 10-15 min Slower onset of side effects	Rapid blockade (onset in 2-5 min)
<b>Effectiveness</b>	Effectiveness of blockade can be variable	Very effective blockade
<b>Difficulty</b>	Technically more difficult; greater failure rate	Easier to perform due to visual confirmation of CSF flow
<b>Patient Positioning</b>	Position of patient not as important; specific gravity not an issue	Hyperbaric LA solution – position of patient important
<b>Specific Gravity/Spread</b>	Solutions injected here spread throughout the potential space; specific gravity of solution does not affect spread	LA solution may be made hyperbaric (of greater specific gravity than the cerebrospinal fluid by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)
<b>Dosage</b>	Larger volume/dose of LA (usually > toxic IV dose)	Smaller dose of LA required (usually < toxic IV dose)
<b>Continuous Infusion</b>	Use of catheter allows for continuous infusion or repeat injections	None
<b>Complications</b>	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), i.e. "high spinal" Epidural or subarachnoid hematoma Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications) Systemic toxicity of LA (accidental intravenous) Catheter complications (shearing, kinking, vascular or subarachnoid placement) Infection Dural puncture	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), i.e. "high spinal" Epidural or subarachnoid hematoma Post-spinal headache (CSF leak) Transient paresthesias Spinal cord trauma, infection
<b>Combined Spinal-Epidural</b>	Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter	

### Contraindications to Spinal/Epidural Anesthesia

- absolute contraindications
  - lack of proper equipment or trained personnel
  - lack of IV access
  - allergy to LA
  - infection at puncture site or underlying tissues
  - coagulopathies/anti-coagulation
  - raised ICP
  - sepsis/bacteremia
  - hemodynamic instability/uncorrected hypovolemia

**Figure 10. Landmarks for placement of epidural/spinal**

#### Landmarking Epidural/Spinal Anesthesia

Spinous processes should be maximally flexed

L4 spinous processes found between iliac crests

Common sites of insertion are L3-L4 and L4-L5

#### Classic Presentation of Dural Puncture Headache

- Onset 6 h-3 d after dural puncture
- Postural component (worse sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

- relative contraindications
  - pre-existing neurological disease
  - aortic/mitral valve stenosis (i.e. fixed cardiac output states)
  - previous spinal surgery, severe kyphoscoliosis
  - severe/unstable psychiatric disease or emotional instability

## Peripheral Nerve Blocks

- utilizes ultrasound guidance and electrical stimulation (needle will stimulate target nerve/plexus), may be used to guide deposition of local anesthetic around nerve while avoiding neural trauma or intraneural injection
- approximately 2-4 per 10,000 risk of late neurologic injury
- most major nerves or nerve plexi can be targeted (e.g. brachial plexus block, femoral nerve block, sciatic nerve block, etc.)

### Contraindications to Peripheral Nerve Blockade

- allergy to LA
- patient refusal, lack of cooperation
- lack of resuscitation equipment
- lack of IV access
- certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
- local infection at block site
- bleeding disorder

## Local Anesthesia

### Local Anesthetic Agents (LA)

- see Table 19 for list of LA agents, A28

#### Definition and Mode of Action

- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the  $\text{Na}^+$  channel, inhibiting  $\text{Na}^+$  flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

#### Absorption, Distribution, Metabolism

- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

#### Selection of LA

- choice of LA depends on
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
  - potential for toxicity

#### Systemic Toxicity

- see Table 19, A28 for maximum doses, potency and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption
- CNS effects first appear to be excitatory due to initial block of inhibitory fibres; then subsequent block of excitatory fibres
- CNS effects (in order of appearance)
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus

**Reduction of Postoperative Mortality and Morbidity with Epidural or Spinal Anaesthesia: Results from Overview of Randomized Trials**  
*BMJ* 2000;321:1-12

**Purpose:** To obtain reliable estimates of the effects of neuraxial blockade with epidural or spinal anesthesia on postoperative morbidity and mortality after various surgeries with or without general anesthesia.

**Study:** Systematic review of all trials with randomization to intra-operative neuraxial blockade versus not.

**Patients:** 141 trials including 9559 patients.

**Main Outcomes:** All cause mortality, MI, PE, DVT, transfusion requirements, pneumonia, other infections, respiratory depression and renal failure.

**Results:** With neuraxial blockade, overall mortality was reduced by about one third. Neuraxial blockade reduced the risk of PE by 55%, DVT by 44%, transfusion requirements by 50%, pneumonia by 39% and respiratory depression by 59%. There were also reductions in MI and renal failure. These mortality reductions are irrespective of surgical group, type of blockade (epidural or spinal) or whether neuraxial blocker was combined with general anesthetic.

**Conclusions:** Neuraxial blockade reduces postoperative mortality and other serious complications.

**Figure 11. Local anesthetic systemic toxicity**

- visual disturbances
- muscle twitching, tremors
- unconsciousness
- convulsions, seizures
- generalized CNS depression, coma, respiratory arrest
- CVS effects
  - vasodilation, hypotension
  - decreased myocardial contractility
  - dose-dependent delay in cardiac impulse transmission
    - ♦ prolonged PR, QRS intervals
    - ♦ sinus bradycardia
  - CVS collapse
- treatment of systemic toxicity
  - early recognition of signs, get help
  - 100% O<sub>2</sub>, manage ABCs
  - diazepam or sodium thiopental may be used to increase seizure threshold
  - manage arrhythmias (see ACLS Guidelines, A28)
  - Intralipid® 20% to bind local anesthetic in circulation

## Local Infiltration and Hematoma Blocks

### Local Infiltration

- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerve endings
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000-1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

### Fracture Hematoma Block

- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

## Topical Anesthetics

- various preparations of local anesthetics available for topical use, may be a mixture of agents, e.g. EMLA cream is a combination of 2.5% lidocaine and prilocaine
- must be able to penetrate the skin or mucous membrane

## Obstetrical Anesthesia

### Physiologic Changes in Pregnancy

- airway
  - possible difficult airway as tissues become edematous and friable especially in labour
- respiratory
  - decreased FRC and increased O<sub>2</sub> consumption → desaturation occurs more quickly during apnea
- cardiovascular system
  - increased blood volume > increased RBC mass → mild anemia
  - decreased SVR proportionately greater than increased CO → decreased BP
  - prone to decreased BP due to aortocaval compression – therefore for surgery, a pregnant patient is positioned in left uterine displacement using a wedge under her right flank
- central nervous system
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- gastrointestinal system
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
  - combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

**Where Not to Use LA with Epinephrine**  
“Ears, Fingers, Toes, Penis, Nose”

**The Effect of Epidural Analgesia on Labour, Maternal, and Neonatal Outcomes: A Systematic Review**

*Am J Obstet Gynecol* 2002;186:S69-77

**Study:** Meta-analysis of 14 studies with 4324 women.

**Selection Criteria:** RCTs and prospective cohort studies between 1980-2001 comparing epidural analgesia to parenteral opioid administration during labour.

**Types of Participants:** Healthy women with uneventful pregnancies.

**Intervention:** Participants were randomized to either epidural analgesia or parenteral opioid administration during labour.

**Outcomes and Results:** Maternal – there were no differences between the 2 groups in first-stage labour length, incidence of Caesarean delivery, incidence of instrumented vaginal delivery for dystocia, nausea, or mid-to-low back pain post-partum. However, second-stage labour length was longer (mean = 15 min) and there were greater reports of fever and hypotension in the epidural group. Also, lower pain scores and greater satisfaction with analgesia were reported among the epidural group. There was no difference in lactation success at 6 wk and urinary incontinence was more frequent in the epidural group immediately post-partum, but not at 3 mo or 1 yr (evidence from PC studies only).

**Neonatal** – there were no differences between the 2 groups for incidence of fetal heart rate abnormalities, intrapartum meconium, poor 5-min Apgar score, or low umbilical artery pH. However, the incidence of poor 1-min Apgar scores and need for neonatal naloxone were higher in the parenteral opioid group.

**Conclusions:** Epidural analgesia is a safe intrapartum method for labour pain relief and women should not avoid epidural analgesia for fear of neonatal harm, Caesarean delivery, breastfeeding difficulties, long-term back pain or long-term urinary incontinence.

### Options for Analgesia during Labour

- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object
- systemic medication
  - easy to administer, but risk of maternal or neonatal depression
  - opioids most commonly used if delivery is not expected within 4 h
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

### Options for Caesarean Section

- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade

## Pediatric Anesthesia

### Respiratory System

- in comparison to adults, anatomical differences in infants include
  - large head, short trachea/neck, large tongue, adenoids and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U shaped and angled at 45 degrees; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include
  - faster RR, immature respiratory centres which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
  - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm and higher resistance to airflow

### Cardiovascular System

- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia → severe compromise in CO

### Temperature Regulation

- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant's head, humidification of inspired gases and warming of infused solutions

### Central Nervous System

- MAC of halothane is increased compared to the adult (i.e. 0.75% adult, 0.87% neonates, 1.2% infant)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetics mature at 4-6 mo → autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

### Glucose Maintenance

- infants less than 1 yr old can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

### Pharmacology

- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB

### Nociceptive Pathways in Labour and Delivery

#### Labour

- Cervical dilation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1

#### Delivery

- Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4

### Adult Upper Airway

© Nicole Clough 2014

### Child Upper Airway

1. Large head
2. Newborns are obligate nasal breathers
3. Adenoid and tonsils
4. Larger tongue in proportion to mouth
5. Smaller pharynx
6. Larger and more flaccid epiglottis
7. Larynx is more superior and anterior
8. Narrowest point at cricoid cartilage
9. Trachea is more narrow and less rigid

© Andrew Q. Tran 2014 (after Leanne Chan 2011)

**Figure 12. Comparison of pediatric vs. adult airway**

To increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume.

**Neonate:** 30-40 breaths/min

**Age 1-13:**  $(24 - [\text{age}/2])$  breaths/min

### ETT Sizing in Pediatrics

Diameter (mm) of tracheal tube in children after 1 year =  $(\text{age}/4) + 4$

Length (cm) of tracheal tube =  $(\text{age}/2) + 12$

- muscle relaxants
  - non-depolarizing
    - ♦ immature NMJ, variable response
  - depolarizing
    - ♦ must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - ♦ more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm and malignant hyperthermia

## Uncommon Complications

### Malignant Hyperthermia (MH)

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular  $\text{Ca}^{2+}$  (because of an anomaly of the ryanodine receptor which regulates the  $\text{Ca}^{2+}$  channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100,000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

#### Clinical Picture

- onset: immediate or hours after contact with trigger agent
  - increased oxygen consumption
  - increased  $\text{ET}_{\text{CO}_2}$  on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - hypertension
  - increased temperature (late sign)
- muscular symptoms
  - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

#### Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

#### Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications (use regional if possible) and use vapour free equipment
- central body temp and  $\text{ET}_{\text{CO}_2}$  monitoring

#### Malignant Hyperthermia Management [Based on Malignant Hyperthermia Association of the U.S. (MHAUS) Guidelines, 2008]

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more; halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
  - repeat until there is control of signs of MH; sometimes up to 30 mg/kg is necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature  $>39^\circ\text{C}$ 
  - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
  - stop cooling if temperature is  $<38^\circ\text{C}$  to prevent drift to  $<36^\circ\text{C}$
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
  - use standard drug therapy except  $\text{Ca}^{2+}$  channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene

#### Signs of Malignant Hyperthermia

- Unexplained rise in  $\text{ET}_{\text{CO}_2}$
- Increase in minute ventilation
- Tachycardia
- Rigidity
- Hyperthermia (late sign)

#### Basic Principles of MH Management

##### "Some Hot Dude Better Get Iced Fluids Fast"

Stop all triggering agents, give 100%  $\text{O}_2$   
 Hyperventilate  
 Dantrolene 2.5 mg/kg every 5 min  
 Bicarbonate  
 Glucose and insulin  
 IV Fluids; cool patient to  $38^\circ\text{C}$   
 Fluid Output; consider furosemide  
 Tachycardia: be prepared to treat VT

6. hyperkalemia
  - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
  - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow  $ET_{CO_2}$ , electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
  - if CK and/or potassium rises persistently or urine output falls to  $<0.5$  mL/kg/h, induce diuresis to  $>1$  mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids and propofol
9. transfer to ICU bed

## Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- 1 in 50 people will be heterozygous for an abnormal pseudocholinesterase allele
- heterozygotes will experience a prolonged duration of muscular blockade (2-3x normal)
- homozygotes will have a greatly increased duration of blockade (4-8 h) following administration of SCh
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors)

## Common Medications

Table 12. Intravenous Induction Agents

	Propofol (Diprivan®)	Thiopental (sodium thiopental, sodium thiopentone)	Ketamine (Ketalar®, Ketaject®)	Benzodiazepines [midazolam (Versed®), diazepam (Valium®), lorazepam (Ativan®)]
<b>Class</b>	• Alkylphenol – hypnotic	• Ultra-short acting thiobarbiturate – hypnotic	• Phencyclidine (PCP) derivative – dissociative	• Benzodiazepines – anxiolytic
<b>Action</b>	• Inhibitory at GABA synapse • Decreased cerebral metabolic rate and blood flow, decreased ICP, decreased SVR, decreased BP and decreased SV	• Decreased time $Cl^-$ channels open, facilitating GABA and suppressing glutamic acid • Decreased cerebral metabolism and blood flow, decreased CPP, decreased $CO_2$ , decreased BP, decreased reflex tachycardia, decreased respiration	• May act on NMDA, opiate and other receptors • Increased HR, increased BP, increased SVR, increased coronary flow, increased myocardial $O_2$ uptake, CNS and respiratory depression, bronchial smooth muscle relaxation	• Causes increased glycine inhibitory neurotransmitter, facilitates GABA • Produces antianxiety and skeletal muscle relaxant effects • Minimal cardiac depression
<b>Indications</b>	• Induction • Maintenance • Total intravenous anesthesia (TIVA)	• Induction • Control of convulsive states	• Major trauma, hypovolemia, severe asthma because sympathomimetic	• Used for sedation, amnesia and anxiolysis
<b>Caution</b>	• Allergy (egg, soy) • Pts who cannot tolerate sudden decreased BP (i.e. fixed cardiac output or shock)	• Allergy to barbiturates • Uncontrolled hypotension, shock, cardiac failure • Porphyria, liver disease, status asthmaticus, myxedema	• Ketamine allergy • TCA medication (interaction causes HTN and dysrhythmias) • History of psychosis • Pts who cannot tolerate HTN (e.g. CHF, increased ICP, aneurysm)	• Marked respiratory depression
<b>Dosing</b>	• IV induction: 2.5-3.0 mg/kg (less with opioids) • Unconscious $<1$ min • Lasts 4-6 min • $t_{1/2}=55$ min • Decreased post-op sedation, recovery time, N/V	• IV induction: 3-5 mg/kg • Unconscious about 30 s • Lasts 5 min • Accumulation with repeat dosing – not for maintenance • $t_{1/2} = 5-10$ h • Post-op sedation lasts hours	• IV induction 1-2 mg/kg • Dissociation in 15 s, analgesia, amnesia and unconsciousness in 45-60 s • Unconscious for 10-15 min, analgesia for 40 min, amnesia for 1-2 h • $t_{1/2} = \sim 3$ h	• Onset less than 5 min if given IV • Duration of action long but variable/somewhat unpredictable
<b>Special Considerations</b>	• 0-30% decreased BP due to vasodilation • Reduce burning at IV site by mixing with lidocaine	• Combining with rocuronium causes precipitates to form	• High incidence of emergence reactions (vivid dreaming, out-of-body sensation, illusions) • Pretreat with glycopyrrolate to decrease salivation	• Antagonist: flumazenil (Anexate®) competitive inhibitor, 0.2 mg IV over 15 s, repeat with 0.1 mg/min (max of 2 mg), $t_{1/2}$ of 60 min • Midazolam also has amnestic (antegrade) effect and decreased risk of thrombophlebitis

Table 13. Opioids

Agent	Relative Dose to 10 mg Morphine IV	Moderate Dose	Onset	Duration	Special Considerations
Codeine	200 mg PO	15-30 mg PO	Late (30-60 min)	Moderate (4-6 h)	Primarily post-operative use, not for IV use
Meperidine (Demerol®)	75 mg IV	2-3 mg/kg IV	Moderate (10 min)	Moderate (2-4 h)	Anticholinergic, hallucinations, less pupillary constriction than morphine, metabolite build up may cause seizures
Morphine	10 mg IV 20 mg PO	0.2-0.3 mg/kg IV 0.4-0.6 mg/kg PO	Moderate (5-10 min)	Moderate (4-5 h)	Histamine release leading to decrease in BP
Oxycodone controlled release (Oxyneo®)	15 mg PO	10-20 mg PO (no IV)	Late (30-45 min)	Long (8-12 h)	Do not split, crush or chew tablet
Oxycodone regular tablet (Oxy IR®)	15 mg PO (no IV)	5-15 mg PO	Moderate (15 min)	Moderate (3-6 h)	Percocet® = oxycodone 5 mg + acetaminophen 325 mg
Hydromorphone (Dilaudid®)	2 mg IV 10 mg PO	40-60 µg/kg IV 2-4 mg PO	Moderate (15 min)	Moderate (4-5 h)	
Fentanyl	100 µg IV	2-3 µg/kg IV	Rapid (<5 min)	Short (0.5-1 h)	Transient muscle rigidity in very high doses
Remifentanyl	100 µg IV	0.5-1.5 µg/kg IV	Rapid (1-3 min)	Ultra short (<10 min)	Only use during induction and maintenance of anesthesia

In general, parenteral route is 2-3 times more potent than oral

Table 14. Opioid PCA Doses

Agent	PCA Dose	PCA Lockout Interval	PCA 4 h Maximum
Morphine	1 mg	5 min	30 mg
Fentanyl	25-50 µg	5 min	400 µg
Hydromorphone	0.2 mg	5 min	6 mg

Table 15. Volatile Inhalational Agents

	Sevoflurane	Desflurane	Isoflurane	Enflurane	Halothane	Nitrous oxide (N <sub>2</sub> O)*
MAC (% gas in O <sub>2</sub> )	2.0	6.0	1.2	1.7	0.8	104
CNS	Increased ICP	Increased ICP	Decreased cerebral metabolic rate Increased ICP	ECG seizure-like activity Increased ICP	Increased ICP and cerebral blood flow	—
Resp	Respiratory depression (severely decreased TV, increased RR), decreased response to respiratory CO <sub>2</sub> reflexes, bronchodilation					—
CVS	Less decrease of contractility, stable HR	Tachycardia with rapid increase in concentration	Decreased BP and CO, increased HR, theoretical chance of coronary steal**	Stable HR, decreased contractility	Decreased BP, CO, HR and conduction Sensitizes myocardium to epinephrine-induced arrhythmias	Can cause decreased HR in pediatric cases in those with existing heart disease
MSK	Muscle relaxation, potentiation of other muscle relaxants, uterine relaxation					

\*Properties and Adverse Effects of N<sub>2</sub>O

Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only  
Second Gas Effect: see *Determinants of Speed of Onset of Volatile Anesthetics* sidebar, A6

Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ETT cuff will markedly enlarge if N<sub>2</sub>O is administered  
Diffusion hypoxia: during anesthesia, the washout of N<sub>2</sub>O from body stores into alveoli can dilute the alveolar [O<sub>2</sub>], creating a hypoxic mixture if the original [O<sub>2</sub>] is low

\*\*Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)

**Table 16. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)**

<b>Mechanism of Action</b>	Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh
<b>Intubating Dose</b>	1-1.5 mg/kg
<b>Onset</b>	30-60 s – RAPID (fastest of all muscle relaxants)
<b>Duration</b>	3-5 min – SHORT (no reversing agent for SCh)
<b>Metabolism</b>	SCh is hydrolyzed by plasma cholinesterase (pseudocholinesterase), found only in plasma and not at the NMJ
<b>Indications</b>	<ul style="list-style-type: none"> <li>• Assist intubation</li> <li>• Increased risk of aspiration (need rapid paralysis and airway control)</li> <li>• Short procedures (e.g. full stomach), hiatus hernia, obesity, pregnancy, trauma</li> <li>• Electroconvulsive therapy (ECT)</li> <li>• Laryngospasm</li> </ul>
<b>Side Effects</b>	<ol style="list-style-type: none"> <li>1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors) <ul style="list-style-type: none"> <li>• May cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children)</li> </ul> </li> <li>2. Hyperkalemia <ul style="list-style-type: none"> <li>• Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors</li> <li>• Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells</li> <li>• Patients at risk: <ul style="list-style-type: none"> <li>▪ 3rd degree burns 24 h-6 mo after injury</li> <li>▪ Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy)</li> <li>▪ Severe intra-abdominal infections</li> <li>▪ Severe closed head injury</li> <li>▪ Upper motor neuron lesions</li> </ul> </li> </ul> </li> <li>3. Can trigger MH</li> <li>4. Increased ICP/intraocular pressure/intragastric pressure (no increased risk of aspiration if competent lower esophageal sphincter)</li> <li>5. Fasciculations, post-op myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration</li> </ol>
<b>Contraindications</b>	
<b>Absolute</b>	Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenita), high risk for hyperkalemic response
<b>Relative</b>	Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

**Table 17. Non-Depolarizing Muscle Relaxants (Competitive)**

<b>Mechanism of Action</b>	Competitive blockade of postsynaptic ACh receptors preventing depolarization				
<b>Classification</b>	<b>Short</b>	<b>Intermediate</b>			<b>Long</b>
	Mivacurium	Rocuronium	Vecuronium	Cisatracurium	Pancuronium
<b>Intubating Dose (mg/kg)</b>	0.2	0.6-1.0	0.1	0.2	0.1
<b>Onset (min)</b>	2-3	1.5	2-3	3	3-5
<b>Duration (min)</b>	15-25	30-45	45-60	40-60	90-120
<b>Metabolism</b>	Plasma cholinesterase	Liver (major) Renal (minor)	Liver	Hofmann Eliminations	Renal (major) Liver (minor)
<b>Indications</b>	Assist intubation, assist mechanical ventilation in some ICU patients, reduce fasciculations and post-op myalgias secondary to SCh				
<b>Side Effects:</b>					
<b>Histamine Release</b>	Yes	No	No	No	No
<b>Other</b>	—	—	—	—	Tachycardia
<b>Considerations</b>	Increased duration of action in renal or liver failure	Quick onset of rocuronium allows its use in rapid sequence induction Cisatracurium is good for patients with renal or hepatic insufficiency			Pancuronium if increased HR and BP desired

**Table 18. Reversal Agents for Non-Depolarizing Relaxants**

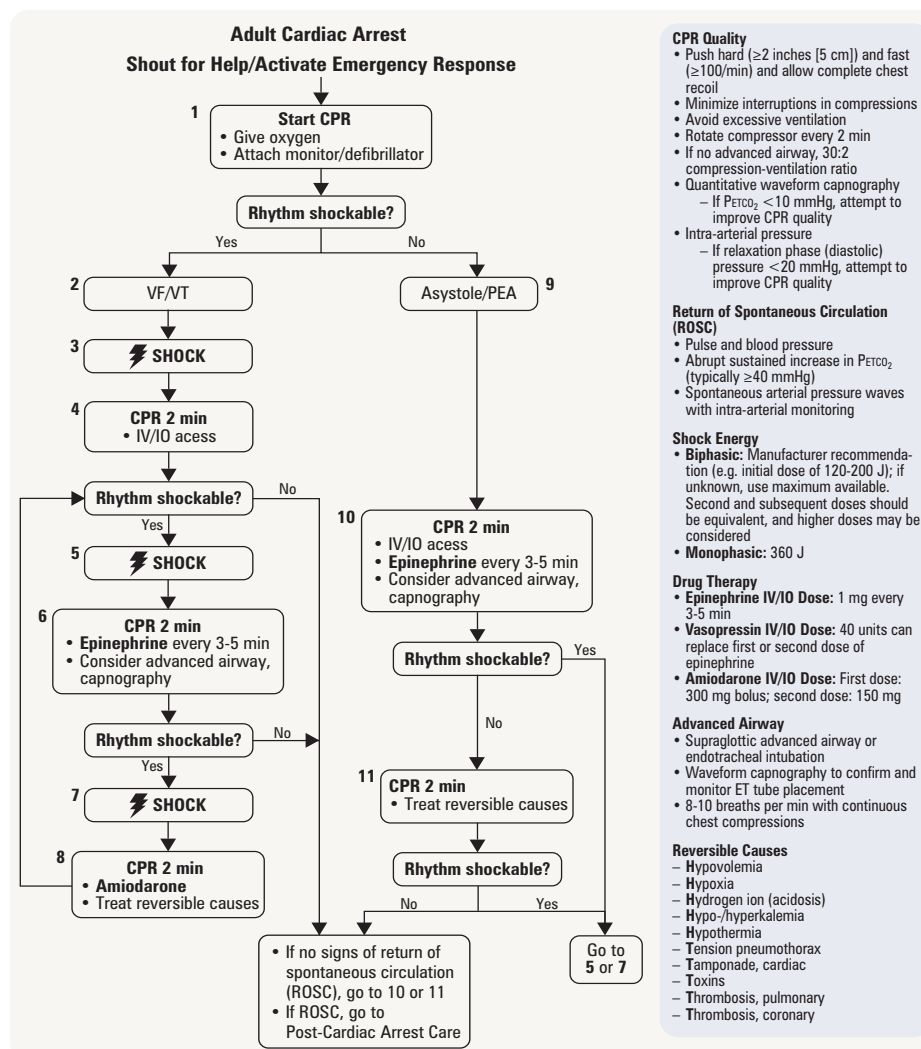

Cholinesterase Inhibitor	Neostigmine	Pyridostigmine	Edrophonium
Onset and Duration	Intermediate	Longest	Shortest
Mechanism of Action	Inhibits enzymatic degradation of ACh, increases ACh at nicotinic and muscarinic receptors, displaces non-depolarizing muscle relaxants Muscarinic effects of reversing agents include unwanted bradycardia, salivation and increased bowel peristalsis*		
Dose	0.04-0.08 mg/kg	0.1-0.4 mg/kg	0.5-1 mg/kg
Recommended Anticholinergic	Glycopyrrolate	Glycopyrrolate	Atropine
Dose of Anticholinergic per mg	0.2 mg	0.05 mg	0.014 mg

\*Atropine and glycopyrrolate are anticholinergic agents administered during the administration of reversal agents to minimize muscarinic effects

**Table 19. Local Anesthetic Agents**

	Maximum Dose	Maximum Dose with Epinephrine	Potency	Duration
chlorprocaine	11 mg/kg	14 mg/kg	Low	15-30 min
lidocaine	5 mg/kg	7 mg/kg	Medium	1-2 h
bupivacaine	2.5 mg/kg	3 mg/kg	High	3-8 h
ropivacaine	2.5 mg/kg	3 mg/kg	High	2-8 h

## Acronyms

AAA	abdominal aortic aneurysm	CVD	cerebrovascular disease	LICS	left intercostal space	RBB	right bundle branch
ABI	ankle-brachial index	DCM	dilated cardiomyopathy	MI	myocardial infarction	RBBB	right bundle branch block
ACEI	angiotensin converting enzyme inhibitor	DM	diabetes mellitus	MPI	myocardial perfusion imaging	RBW	routine blood work
ACS	acute coronary syndrome	DVT	deep vein thrombosis	MR	mitral regurgitation	RVH	right ventricular hypertrophy
Afib	atrial fibrillation	ECASA	enteric coated ASA	MRA	MRI angiography	SEM	systolic ejection murmur
AR	aortic regurgitation	ECG	electrocardiogram	MS	mitral stenosis	STEMI	ST elevation myocardial infarction
ARB	angiotensin receptor blocker	Echo	echocardiogram	NSTEMI	non-ST elevation myocardial infarction	SVT	supraventricular tachycardia
ARDS	acute respiratory distress syndrome	EtOH	ethanol/alcohol	NSR	normal sinus rhythm	SCD	sudden cardiac death
AS	aortic stenosis	GERD	gastroesophageal reflux disease	OS	opening snap	SV	stroke volume
ASA	acetylsalicylic acid (Aspirin®)	HCM	hypertrophic cardiomyopathy	PCI	percutaneous coronary intervention	SVR	systemic vascular resistance
AV	atrioventricular	HTN	hypertension	PIV	posterior-interventricular artery	SLE	systemic lupus erythematosus
AVM	arteriovenous malformation	HR	heart rate	PND	paroxysmal nocturnal dyspnea	SA	sinoatrial
AVNRT	atrioventricular nodal re-entrant tachycardia	ICD	implantable cardiac defibrillator	PE	pulmonary embolism	SVT	supraventricular tachycardia
AVRT	atrioventricular re-entrant tachycardia	IE	infective endocarditis	PAC	premature atrial contraction	TAA	thoracic aortic aneurysm
BBB	bundle branch block	JVP	jugular venous pressure	PVC	premature ventricular contraction	TB	tuberculosis
BNP	brain natriuretic peptide	LA	left atrium	PDA	patent ductus arteriosus	TIA	transient ischemic attack
BP	blood pressure	LAE	left atrial enlargement	PFO	patent foramen ovale	TEE	transesophageal echocardiography
CABG	coronary artery bypass graft	LMWH	low molecular weight heparin	PUD	peptic ulcer disease	TTE	transthoracic echocardiography
CXR	chest x-ray	LVEF	left ventricular ejection fraction	PVD	peripheral vascular disease	UA	unstable angina
CAD	coronary artery disease	LBB	left bundle branch	RA	rheumatoid arthritis	VAD	ventricular assist device
CO	cardiac output	LBBB	left bundle branch block	RA	right atrium	VFib	ventricular fibrillation
CCB	calcium channel blocker	LV	left ventricle	RAE	right atrial enlargement	VT	ventricular tachycardia
CHF	congestive heart failure	LVH	left ventricular hypertrophy	RAO	right anterior oblique	VTE	venous thromboembolism
COPD	chronic obstructive pulmonary disease	LLSB	left lower sternal border	RV	right ventricle	WPW	Wolff-Parkinson-White
CTA	CT angiography						

## Basic Anatomy Review

### Coronary Circulation

- conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta (see Figure 1)
  - right coronary artery (RCA)
    - acute marginal branches
    - atrioventricular (AV) nodal artery
    - posterior interventricular artery (PIV) = posterior descending artery (PD)
  - left main coronary artery (LCA): two major branches
    - left anterior descending artery (LAD)
      - septal branches
      - diagonal branches
    - left circumflex artery (LC)
      - obtuse marginal branches
- dominance of circulation
  - right-dominant circulation: PIV and at least one posterolateral branch arise from RCA (80%)
  - left-dominant circulation: PIV and at least one posterolateral branch arise from LC (15%)
  - balanced circulation: dual supply of posteroinferior LV from RCA and LC (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through Thebesian veins into all four chambers, contributing to the physiologic R-L shunt

Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)

Figure 2a. Cardiac cycle

Grey shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

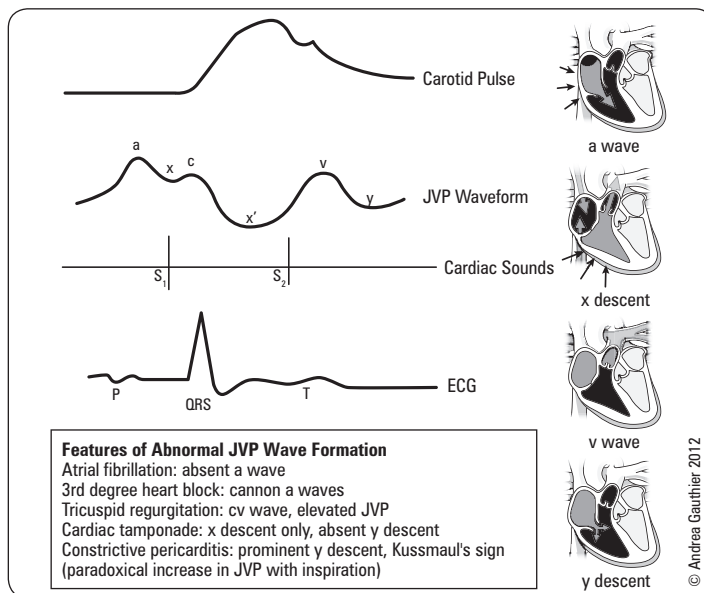

Figure 2b. JVP waveform

## Cardiac Anatomy

### • layers of the heart

- endocardium
- myocardium
- epicardium
- visceral pericardium
- pericardial cavity
- parietal pericardium

### • valves

- semilunar valves: no subvalvular apparatus present
  - ♦ aortic valve, 3 valve leaflets: separates LV and ascending aorta
  - ♦ pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
- atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
  - ♦ tricuspid valve, 3 valve leaflets: separates RA and RV
  - ♦ mitral valve, 2 valve leaflets: separates LA and LV

### • conduction system (see Figure 3)

- SA node governs pacemaking control
- anterior-, middle- and posterior-internal nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
- atrial impulses converge at the AV node
  - ♦ the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosis (except when accessory pathways are present)
- the bundle of His bifurcates into left and right bundle branches (LBB and RBB)
- LBB further splits into anterior and posterior fascicles
- RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

Figure 3. Conduction system of the heart

Figure 4. Blood vessel structure

- **cardiovascular innervation**

- sympathetic nerves
  - ♦ innervate the SA node, AV node, ventricular myocardium and vasculature
  - ♦ SA node ( $\beta_1$ ) fibres increase pacemaking activity (chronotropy)
  - ♦ cardiac muscle ( $\beta_1$ ) fibres increase contractility (inotropy) to help increase cardiac output
  - ♦ stimulation of  $\beta_1$ - and  $\beta_2$ -receptors in the skeletal and coronary circulation causes vasodilatation
- parasympathetic nerves
  - ♦ innervate the SA node, AV node, atrial myocardium but few vascular beds
  - ♦ basal vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node resulting in slowing of pacemaker activity and conduction (i.e. reduced dromotropy – if only affecting AV node conduction)
  - ♦ parasympathetics have very little impact on total peripheral vascular resistance

## Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, underlined text indicates life threatening

### Chest Pain

- cardiac
  - **MI/angina**
  - myocarditis
  - pericarditis/Dressler's syndrome
  - cardiac tamponade
- pulmonary
  - **pneumonia**
  - pulmonary embolism (PE)
  - pneumothorax/hemothorax, tension pneumothorax
  - empyema
  - pulmonary neoplasm
  - bronchiectasis
  - TB
- gastrointestinal
  - esophageal: spasm, **GERD**, esophagitis, ulceration, achalasia, neoplasm, Mallory-Weiss syndrome, esophageal rupture
- gastrointestinal
  - PUD
  - gastritis
  - pancreatitis
  - biliary colic
- mediastinal
  - lymphoma
  - thymoma
- vascular
  - dissecting aortic aneurysm
  - aortic rupture
- surface structures
  - costochondritis
  - rib fracture
  - skin (bruising, herpes zoster)
  - breast
- anxiety/psychosomatic

### Loss of Consciousness

- **hypovolemia**
- cardiac
  - structural or obstructive causes
    - ♦ acute coronary syndrome
    - ♦ aortic stenosis
    - ♦ hypertrophic cardiomyopathy (HCM)
    - ♦ cardiac tamponade, constrictive pericarditis
  - arrhythmias (see *Arrhythmias*, C12)
- respiratory
  - massive pulmonary embolism
  - pulmonary hypertension
  - hypoxia
  - hypercapnia
- neurologic
  - stroke/TIA (esp. vertebrobasilar insufficiency)
  - migraine
  - seizure
- metabolic
  - **anemia**
  - **hypoglycemia**
- drugs
  - antihypertensives
  - antiarrhythmics
  - diuretics
- **vasovagal**
- autonomic dysfunction
  - diabetic neuropathy
- psychiatric
  - panic attack

### Local Edema

- inflammation/infection
- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis
  - venous insufficiency
  - chronic lymphangitis
  - lymphatic tumour infiltration
  - filariasis

### Generalized Edema

- increased hydrostatic pressure/fluid overload
  - **heart failure**
  - pregnancy
  - drugs (e.g. CCBs)
  - **iatrogenic** (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - nephrotic syndrome
- **liver cirrhosis**
  - malnutrition
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism
  - exogenous steroids
  - pregnancy
  - estrogens

## Palpitations

- cardiac
  - **arrhythmias** (PAC, PVC, SVT, **VT**)
  - **valvular heart disease**
  - **hypertrophic cardiomyopathy (HCM)**
- endocrine
  - **thyrotoxicosis**
  - pheochromocytoma
  - hypoglycemia
- systemic
  - fever
  - **anemia**
- drugs
  - stimulants and anticholinergics
- psychiatric
  - panic attack

## Dyspnea

- cardiovascular
  - **acute MI**
  - **CHF/LV failure**
  - aortic/mitral stenosis
  - aortic/mitral regurgitation
  - arrhythmia
  - **cardiac tamponade**
  - constrictive pericarditis
  - left-sided obstructive lesions (e.g. left atrial myxoma)
  - elevated pulmonary venous pressure
- respiratory
  - airway disease
    - ♦ **asthma**
    - ♦ COPD exacerbation
    - ♦ upper airway obstruction (anaphylaxis, foreign body, mucus plugging)
  - parenchymal lung disease
    - ♦ **ARDS**
    - ♦ pneumonia
    - ♦ interstitial lung disease
- pulmonary vascular disease
  - ♦ **pulmonary embolism**
  - ♦ pulmonary HTN
  - ♦ pulmonary vasculitis
- pleural disease
  - ♦ pneumothorax
  - ♦ pleural effusion
- neuromuscular and chest wall disorders
  - C-spine injury
  - polymyositis, myasthenia gravis, Guillain-Barré syndrome
  - kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, hypercapnia

## Cardiac Diagnostic Tests

### Electrocardiography (ECG) Basics

- the electrocardiogram (ECG) is a graphic representation of the electrical activity of the heart recorded from the surface of the body
- on the ECG graph
  - the horizontal axis represents time
    - ♦ 1 mm (1 small square) = 40 msec
    - ♦ 5 mm (1 large square) = 200 msec (at paper speed 25 mm/s)
  - the vertical axis represents voltage
    - ♦ 1 mm (1 small square) = 0.1 mV
    - ♦ 10 mm (2 large squares) = 1 mV (at standard gain setting)
- leads
  - standard 12-lead ECG
    - ♦ limb leads: I, II, III, aVL, aVR, aVF
    - ♦ precordial leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
  - additional leads
    - ♦ right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
  - lateral = I, aVL, V5, V6; inferior = II, III, aVF; anterior = V1-V4

Figure 5. ECG lead placement

Figure 6. ECG waveforms and normal values

### Approach to ECGs

#### RATE

- normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib)
- regular rhythm
  - to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 s)
  - or remember 300-150-100-75-60-50-43 (rate falls in this sequence with the number of large squares between 2 QRS complexes)
- irregular rhythm
  - rate = 6 x number of R-R intervals in 10 s (the "rhythm strips" are 10 s recordings)
  - types: wandering pacemaker, multifocal atrial tachycardia, AFib
- atrial escape = 60-80 bpm; junctional escape = 40-60 bpm; ventricular escape = 20-40 bpm

#### Rate Calculations

- Examples, practice

#### Approach to ECGs Summary

- Rate
- Rhythm
- Axis
- Conduction
- Chamber enlargement/hypertrophy
- Ischemia/infarction
- Miscellaneous

For more examples and practice visit  
[www.ecgmadesimple.com](http://www.ecgmadesimple.com).

**RHYTHM**

- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly-irregular: repeating pattern of varying R-R intervals
- irregularly-irregular: R-R intervals vary erratically
- normal sinus rhythm (NSR)
  - P wave precedes each QRS; QRS follows each P wave
  - P wave axis is normal (positive in leads I, aVF)
  - rate between 60-100 bpm

**AXIS**

- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
- the standard ECG reported QRS axis usually refers to the mean axis of the anterior plane; it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane (see Figure 7)
  - normal axis:  $-30^\circ$  to  $90^\circ$  (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis  $< -30^\circ$
  - right axis deviation (RAD): axis  $> 90^\circ$
- QRS axis in the horizontal plane is not routinely calculated; it is directed posteriorly and to the left
  - transition from negative to positive is usually in lead V3

**INTRAVENTRICULAR CONDUCTION ABNORMALITIES****Left Bundle Branch Block (LBBB)****Complete LBBB**

- QRS duration  $> 120$  msec
- Broad notched or slurred R waves in leads I, aVL and usually V5 and V6
- Deep broad S waves in leads V1-2
- Secondary ST-T changes (-ve in leads with broad R waves, +ve in V1-2) are usually present
- LBBB can mask ECG signs of MI

**Right Bundle Branch Block (RBBB)****Complete RBBB**

- QRS duration  $> 120$  msec
- Positive QRS in lead V1 (rSR' or occasionally broad R wave)
- Broad S waves in leads I, V5-6 ( $> 40$  msec)
- Usually secondary T wave inversion in leads V1-2

**Left Anterior Fascicular Block (LAFB) (Left Anterior Hemiblock)****Left axis deviation ( $-30^\circ$  to  $-90^\circ$ )**

- Small q and prominent R in leads I and aVL
- Small r and prominent S in leads II, III, and aVF

**Left Posterior Fascicular Block (LPFB) (Left Posterior Hemiblock)****Right axis deviation ( $110^\circ$  to  $180^\circ$ )**

- Small r and prominent S in leads I and aVL
- Small q and prominent R in leads II, III, and aVF

**Bifascicular Block****RBBB pattern**

- Small q and prominent R
- The first 60 msec (1.5 small squares) of the QRS shows the pattern of LAFB or LPFB
- Bifascicular block refers to impaired conduction in two of the three fascicles, most commonly a RBBB and left anterior hemiblock; the appearance on an ECG meets the criteria for both types of blocks

**Nonspecific Intraventricular Block**

- QRS duration  $> 120$  msec
- absence of criteria for LBBB or RBBB

**Intervals**

PR	QRS	QT
Increased ( $> 200$ msec): <ul style="list-style-type: none"> <li>• Heart block</li> <li>• Atrial flutter</li> <li>• Sinus bradycardia</li> <li>• Hypokalemia</li> </ul>	Increased ( $> 120$ msec): <ul style="list-style-type: none"> <li>• Bundle branch block</li> <li>• Ventricular Tachycardia</li> <li>• Ventricular hypertrophy</li> <li>• WPW</li> <li>• Ectopic ventricular beat</li> <li>• Hyperkalemia</li> <li>• Drugs (e.g. TCAs, antiarrhythmics)</li> </ul>	Increased ( $QTc^* > 440$ msec): <ul style="list-style-type: none"> <li>• Genetic long QT syndrome</li> <li>• Drugs (e.g. antibiotics, SSRIs, anti-psychotics, antiarrhythmics)</li> <li>• Electrolyte disturbances (e.g. hypocalcemia, hypomagnesium, hypokalemia)</li> <li>• Hypothyroid</li> </ul>
Decreased ( $< 120$ msec): <ul style="list-style-type: none"> <li>• Pre-excitation syndrome (WPW)</li> </ul>		Decreased ( $QTc^* < 360$ msec) <ul style="list-style-type: none"> <li>• Hypercalcemia</li> <li>• Digoxin</li> <li>• Hyperthyroid</li> </ul>

$QTc^* = QT \text{ interval} \div \sqrt{RR \text{ interval}}$

**Differential Diagnosis for Left and Right Axis Deviation**

LAD	RAD
Left ant. hemiblock	RVH
Inferior MI	Left post
WPW	hemiblock
RV pacing	PE
Normal variant	COPD
Elevated diaphragm	Lateral MI
Lead misplacement	WPW
Endocardial cushion defect	Dextrocardia
	Septal defects

**Figure 7. Axial reference system**

Each lead contains a (+) area displayed by the bold arrows. Impulses traveling toward the positive region of the lead results in an upward deflection in that lead. Normal QRS axis is between  $-30^\circ$  and  $+90^\circ$ .

**Left Bundle Branch Block****Right Bundle Branch Block****Left Ventricular Hypertrophy****Right Ventricular Hypertrophy**

**Figure 8. Complete LBBB, RBBB, LVH and RVH** (please see online examples for the full range of waveforms and the text for additional characteristics)

## HYPERTROPHY AND CHAMBER ENLARGEMENT

Left Ventricular Hypertrophy (LVH)	Right Ventricular Hypertrophy (RVH)
<ul style="list-style-type: none"> <li>S in V1 + R in V5 or V6 &gt;35 mm above age 40, (&gt;40 mm for age 31-40, &gt;45 mm for age 21-30)</li> <li>R in aVL &gt;11 mm</li> <li>R in I + S in III &gt;25 mm</li> <li>Additional criteria: <ul style="list-style-type: none"> <li>LV strain pattern (ST depression and T wave inversion in leads I, aVL, V4-V6)</li> <li>Left atrial enlargement</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Right axis deviation</li> <li>R/S ratio &gt;1 or qR in lead V1</li> <li>RV strain pattern: ST segment depression and T wave inversion in leads V1-2</li> </ul>
Left Atrial Enlargement (LAE)	Right Atrial Enlargement (RAE)
<ul style="list-style-type: none"> <li>Biphasic P wave with the negative terminal component of the P wave in lead V1 <math>\geq 1</math> mm wide and <math>\geq 1</math> mm deep</li> <li>P wave &gt;120 msec, notched in lead II ("P mitrale")</li> </ul>	<ul style="list-style-type: none"> <li>P wave &gt;2.5 mm in height in leads II, III, or aVF ("P pulmonale")</li> </ul>

## ISCHEMIA/INFARCTION

- look for the anatomic distribution of the following ECG abnormalities (see Table 1)
- ischemia
  - ST segment depression
  - T wave inversion (most commonly in V1-V6)
- injury
  - transmural (involving the epicardium): ST elevation in the leads facing the area injured/infarcted; transient ST elevation may occur in patients with coronary artery spasm (e.g. Prinzmetal angina) which can be slight or prominent (>10 mm)
  - subendocardial: marked ST depression in the leads facing the affected area; may be accompanied by enzyme changes and other signs of MI, may also occur with angina

Figure 10. Typical ECG changes with infarction

- evolving infarction (ST elevation in contiguous leads = acute MI)
- "typical" sequential changes of evolving MI
  - hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  - ST elevation (injury pattern) in the leads facing the infarcted area
    - usually in the first hours post infarct
    - in acute posterior infarction, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads, that are not recorded in the standard 12-lead ECG)
  - significant Q waves: >40 msec or >1/3 of the total QRS (hours to days post-infarct)
  - inverted T waves (one day to weeks after infarction)
    - this classical sequence does not always occur
    - Q waves of infarction may appear in the very early stages, with or without ST changes
    - non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
- completed infarction
  - abnormal Q waves (wide Q waves may be found in III and aVL in normal individuals)
    - duration >40 msec (>30 msec in aVF for inferior infarction)
    - Q/QRS voltage ratio is >33%
  - abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and more frequently in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

### Left Atrial Enlargement

### Right Atrial Enlargement

Figure 9. LAE, RAE (please see online examples and text above for characteristics)

### Significant ECG Changes

- Look for ST changes starting at 60 msec from J point
- J point = the junction between the QRS complex and the ST segment
- ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
- ST depression: downsloping or horizontal
- Q wave: pathological if Q wave  $\geq 1$  small square ( $\geq 40$  msec) or >33% of the total QRS

### Insignificant Q wave

- Septal depolarization by the left bundle
- Seen in leads I, II, III, aVL, V5, V6
- <40 msec

### Differential of ST Segment Changes

#### ST Elevation "I HELP A PAL"

Ischemia with reciprocal changes  
Hypothermia (Osborne waves)  
Early repolarization (normal variant; need old ECGs)  
LBBB  
Post-MI  
Acute STEMI  
Prinzmetal's (Vasospastic) angina  
Acute pericarditis (diffuse changes)  
Left/right ventricular aneurysm

#### ST Depression "WAR SHIP"

WPW syndrome  
Acute NSTEMI  
RBBB/LBBB  
STEMI with reciprocal changes  
Hypertrophy (LVH or RVH) with strain  
Ischemia  
Post-MI

**Table 1. Areas of Infarction(Q wave)/Ischemia (in right dominant anatomy)**

Vessel Usually Involved	Infarct Area (LAD and LC)	Leads (LAD and LC)
Left anterior descending (LAD)	Anteroseptal	V1, V2
	Anterior	V3, V4
	Anterolateral	I, aVL, V3-6
	Extensive anterior	I, aVL, V1-6
Right coronary artery (RCA)	Inferior	II, III, aVF
	Right ventricle	V3R, V4R (right sided chest leads)
	Posterior MI (assoc. with inf. MI)	V1, V2 (prominent R waves)
Circumflex	Lateral	I, aVL, V5-6
	Isolated posterior MI	V1, V2 (prominent R waves)

## MISCELLANEOUS ECG CHANGES

### Electrolyte Disturbances

- hyperkalemia (see Figure 11)
  - mild to moderate ( $K^+$  5-7 mmol/L): tall peaked T waves
  - severe ( $K^+$  >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show bizarre patterns, axis shifts left or right, ST shift with tall T waves
- hypokalemia (see Figure 12)
  - ST segment depression, prolonged QT interval, low T waves, prominent U waves (U>T)
  - enhances the toxic effects of digitalis
- hypercalcemia: shortened QT interval
- hypocalcemia: prolonged QT interval

**Figure 11. Hyperkalemia****Figure 12. Hypokalemia**

### Hypothermia

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves (see Figure 13): “hump-like” waves at the junction of the J point and the ST segment

### Pericarditis

- early: diffuse ST segment elevation  $\pm$  PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- low voltage if chronic constrictive pericarditis
- tachycardia

### Drug Effects

- digitalis
  - therapeutic levels may be associated with “digitalis effect” (see Figure 14):
    - ST downsloping or “scooping”
    - T wave depression or inversion
    - QT shortening  $\pm$  U waves
    - slowing of ventricular rate in AFib
  - toxic levels associated with:
    - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (see *Arrhythmias*, C12)
    - “regularization” of ventricular rate in AFib due to a junctional rhythm and AV dissociation
- amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, some antibiotics: prolonged QT interval, U waves

#### Low Voltage

- Definition: total QRS height in precordial leads <10 mm and limb leads <5 mm
- Differential diagnosis
  - Myocardial disease
    - Ischemia
    - Cardiomyopathy (usually infiltrative type), myocarditis
  - Pericardial effusion
  - Thick chest wall/barrel chest: COPD, obesity
  - Generalized edema
  - Hypothyroidism/myxedema
  - Inappropriate voltage standardization

**Figure 13. Osborne J waves of a hypothermic patient**

#### Digitalis Side Effects

Palpitations, fatigue, visual changes (yellow vision), decreased appetite, hallucinations, confusion and depression.

#### Quinidine

- Wide P wave
- Wide QRS
- Prolonged QT
- $\pm$  ST depression
- $\pm$  U wave

Figure 14. Atrial fibrillation, ST change due to digitalis ("digitalis effect")

### Pulmonary Disorders

- cor pulmonale (often secondary to COPD)
  - low voltage, RAD, poor R wave progression
  - RAE and RVH with strain
  - multifocal atrial tachycardia (MAT)
- massive PE
  - sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain – most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III)

### Pacemakers

- Demand pacemaker has discharge (narrow vertical spike on ECG strip) prior to QRS
- Atrial pacemaker has discharge prior to P wave
- Triggered pacemaker has a discharge following the P wave but prior to the QRS
- Atrial and ventricular pacing have discharged before the P wave and QRS wave

## Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

Table 2. Cardiac Enzymes

Enzyme	Peak	Duration Elevated	DDx of Elevation
Troponin I, Troponin T	1-2 d	Up to 2 wk	MI, CHF, AFib, acute PE, myocarditis, chronic renal insufficiency, sepsis, hypovolemia
CK-MB	1 d	3 d	MI, myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, etc.

- check troponin I at presentation and 8 h later  $\pm$  creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- new CK-MB elevation can be used to diagnose reinfarction
- other biomarkers of cardiac disease:
  - AST and LDH also increased in MI (low specificity)
  - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
    - DDx of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN

Figure 15. Cardiac enzymes

### Use of B-Type Natriuretic Peptide in the Evaluation and Management of Acute Dyspnea (BASEL)

NEJM 2004;350:647-54

Study: Prospective, RCT.

**Population:** 452 patients (mean age 71 yr. 58% male) with acute dyspnea; patients with severe renal disease or cardiogenic shock were excluded.

**Intervention:** Assessment including measurement of B-type natriuretic peptide or standard assessment.

**Outcome:** Time to discharge and total cost of treatment.

**Results:** Median time to discharge was significantly shorter in the intervention group when compared with the control group (8.0 vs. 11.0 d,  $p=0.001$ ). Total cost was also significantly lower in the intervention group (\$5410 vs. \$7264,  $p=0.006$ ). In addition, the measurement of B-type natriuretic peptide significantly reduced the need for admission to hospital and intensive care. The 30-d mortality rates were similar (10% vs. 12%,  $p=0.45$ ).

**Conclusions:** In patients with acute dyspnea, measurement of B-type natriuretic peptide improves clinical outcomes (need for hospitalization or intensive care) and reduces time to discharge and total cost of treatment.

## Ambulatory ECG

- indications for outpatient testing: palpitations, syncope, antiarrhythmic drug monitoring, arrhythmia surveillance in patients with documented or potentially abnormal rhythms, and surveillance of non-sustained arrhythmias that can lead to prophylactic intervention
- available technologies
  - Holter monitor
    - battery operated, continually records up to 3 leads for 24-48 h
    - symptoms recorded by patient on Holter clock for correlation with ECG findings
  - continuous loop recorder (diagnostic yield 66-83%)
    - worn continuously and can record data before and after patient activation for symptomatic episodes (usually worn for 2 wk)
  - external and implantable devices
    - external devices can be transtelephonically downloaded
    - implantable loop recorder (ILR): cannot be transtelephonically downloaded; left in place for 14 to 18 mo

## Echocardiography

### Transthoracic Echocardiography (TTE)

- ultrasound beams are directed across the chest wall to obtain images of the heart
- indications: evaluation of left ventricular ejection fraction (LVEF), wall motion abnormalities, myocardial ischemia and complications of MI, chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion, unexplained hypotension, murmurs, syncope, congenital heart disease
- use with Doppler to quantify degree of valvular stenosis or regurgitation

### Transoesophageal Echocardiography (TEE)

- ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
- better visualization of posterior structures, including left atrium, mitral and aortic valves, interatrial septum
- invasive procedure used to complement transthoracic echocardiography
- indications: intracardiac thrombi, tumours, valvular vegetations (infective endocarditis), aortic dissection, aortic atheromas, prosthetic valve function, shunt, technically inadequate transthoracic study
- use with Doppler to quantify degree of valvular stenosis or regurgitation

### Stress Echocardiography

- echocardiography in combination with either physiologic (exercise treadmill or bike testing) or pharmacologic (dobutamine infusion) stress
- validated in demonstrating myocardial ischemia and assessing viability
- provides information on the global left ventricular response to exercise
- used for valvular heart disease evaluation

### Contrast Echocardiography

- contrast agents injected into the bloodstream to improve imaging of the heart
- conventional agent: agitated saline (contains microbubbles of air)
- allows visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and sometimes intrapulmonary shunt
- newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction, wall motion abnormalities, and intracardiac mass

## Stress Testing

### EXERCISE TESTING

- cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- guidelines for use:
  - patients with intermediate (10-90%) pretest probability of CAD based on age, gender and symptoms
  - ST depression  $<1$  mm at rest, no left bundle branch block, no digoxin or estrogen use
- exercise test results stratify patients into risk groups:
  - low risk patients can be treated medically without invasive testing
  - intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
  - high risk patients should be referred for cardiac catheterization

### Indications for Terminating Exercise Stress Test

- drop in systolic blood pressure of  $>10$  mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
- moderate to severe angina
- ST elevation ( $>1$  mm) in leads without diagnostic Q-waves (other than V1 or aVR)
- increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
- signs of poor perfusion (cyanosis or pallor)
- technical difficulties in monitoring ECG or systolic blood pressure
- patient's desire to stop
- sustained ventricular tachycardia

### Interpretation

- the most commonly used ECG criteria for a positive exercise test:  $\geq 1$  mm of horizontal or downsloping ST-segment depression or elevation (at least 60 to 80 msec after the end of the QRS complex)

### NUCLEAR CARDIOLOGY

- myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
- evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
- predicts the likelihood of further cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
- often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
- stress with either treadmill or IV vasodilator stress [dipyridamole (Persantine®), adenosine]
- images of the heart obtained during stress and at rest 3-4 h later
  - fixed defect: impaired perfusion at rest and during stress (infarcted/hibernating)
  - reversible defect: impaired perfusion only during stress (ischemic)

#### Most Commonly Used Treadmill Stress Test Protocols

- **The Bruce Protocol:** 7 stage test with each stage lasting 3 min. With each successive stage, the treadmill increases in both speed and gradient
- **The Modified Bruce, Modified Naughton Protocol:** for older individuals or those with limited exercise capacity

#### Important Contraindications to Exercise Testing

- Acute MI, aortic dissection, pericarditis, myocarditis, PE
- Severe AS, arterial HTN
- Inability to exercise adequately

#### Important Prognostic Factor Duke Treadmill Score (DTS) Weighted Index Score:

- Treadmill exercise time using standard Bruce protocol
- Maximum net ST segment deviation (depression or elevation)
- Exercise-induced angina provides diagnostic and prognostic information (such as 1-yr mortality)

$$DTS = \text{exercise time} - (5 \times \text{MaxST}) - (4 \times \text{angina index})$$

Ann Intern Med 1987;106:793-800

Patients with normal imaging (nuclear perfusion or stress echo) studies at peak stress have a  $<1\%$ /yr incidence of death or nonfatal MI and are thus often spared further invasive evaluation.

- tracers
  - thallium-201 ( $^{201}\text{Tl}$ , a  $\text{K}^+$  analogue)
  - technetium-99 ( $^{99}\text{Tc}$ )-labelled tracer (sestamibi/Cardiolite® or hexamibi/Myoview®)

### STRESS ECHOCARDIOGRAPHY

- see *Stress Echocardiography*, C10

### INDICATIONS FOR STRESS TESTING

- exercise ECG
  - initial evaluation in patients who are able to exercise
- exercise stress echo
  - when ECG is uninterpretable
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS when used to decide on potential efficacy of revascularization
  - to evaluate the clinical significance of valvular heart disease
- dobutamine stress echo (DSE)
  - among patients unable to exercise; same indications as exercise stress echo
  - low dose DSE can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- exercise MPI
  - when ECG is uninterpretable
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - in patients with previous imaging whose symptoms have changed
  - to diagnose ischemia
- dipyridamole/adenosine MPI
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarkers
  - when ECG is uninterpretable due to LBBB or V-paced rhythm
  - among patients unable to exercise, with the same indications as exercise MPI

#### ACC/AHA 2009 Guidelines for Use of Nuclear Testing

Stable angina, baseline ECG abnormalities, post-revascularization assessment, heart failure, patients unable to exercise, preoperative risk assessment for patients undergoing noncardiac surgery.

#### Sensitivity and Specificity of Various Stress Testing

- Exercise ECG (Sn 68; Sp 77)
- Stress Echocardiography (Sn 76; Sp 88)
- PET scanning (Sn 91; Sp 82)
- MIBI scanning (Sn 88; Sp 77)

## Cardiac Catheterization and Angiography

- risks of procedure related complications: vascular injury, renal failure, stroke, MI
- mortality rate 0.1-0.2%
- invasive: catheters are introduced percutaneously into arterial and venous circulation under conscious sedation and contrast is injected
- arterial access most commonly through the femoral artery; radial approach gaining favour especially for obese patients and outpatients dependent on driving and ambulation
- venous access through the femoral vein or internal jugular vein
- same day procedure as outpatient
  - indications for prehospitalization: anticoagulation, renal failure, diabetes, contrast allergy
- catheterization permits direct measurement of intracardiac pressures, transvalvular and mean peak pressure gradients, valve areas, cardiac output, shunt data, oxygen saturations, and visualization of coronary arteries, cardiac chambers and great vessels
- angiography may provide valuable information regarding lesion severity, complexity, location and prognosis

### Right Heart Catheterization (Swan-Ganz Catheter)

- right atrial, right ventricular, and pulmonary artery pressures are recorded
- pulmonary capillary wedge pressure (PCWP)
  - obtained by advancing the catheter to wedge in the distal pulmonary artery
    - ♦ records pressure measured from the pulmonary venous system
    - ♦ in the absence of pulmonary venous disease reflects left atrial pressure

### Left Heart Catheterization

- systolic and end-diastolic pressure tracings recorded; LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
- cardiac output (measured by the Fick oxygen method or the indicator dilution method)

### Coronary Angiography

- coronary vasculature accessed via the coronary ostia
- contraindicated in severe renal failure (due to contrast agent toxicity) must check renal status

**Figure 16. Coronary angiogram schematic** (RCA = right coronary artery; AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal)

### Diagnostic Catheterization

- complications for diagnostic catheterization <1%
- inadequate diagnostic procedures occur in fewer than 1% of cases
- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, or prostacyclin)

#### ACC/AHA 2011 Recommended Indications for Coronary Angiography

- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

#### Coronary Angiography

Gold standard for localizing and quantifying CAD.

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter.

## Contrast-Enhanced CT Coronary Angiography

- fast ECG-synchronized multi-slice CT image acquisition in the heart has enabled non-invasive imaging of the coronary arterial tree
- often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis

## Magnetic Resonance Imaging (MRI)

- offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
- valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, and assessment of viable myocardium

## CARDIAC DISEASE

## Arrhythmias

## Mechanisms of Arrhythmias

### (I) Alterations in Impulse Formation

#### A. Abnormal Automaticity

- automaticity is a property of certain cardiomyocytes to depolarize to their threshold voltage to spontaneously generate action potentials in a rhythmical fashion
- under normal circumstances only cells in the specialized conduction system (SA node, AV node and ventricular conduction system) exhibit natural automaticity. These cells are pacemaking cells. The automaticity of these cells can become abnormally increased or decreased

- in disease (e.g. post-MI ventricular ischemia) cells in the myocardium outside the conduction system may inappropriately acquire the property of automaticity and contribute to abnormal depolarization. If these ectopic generators depolarize at a rate that is greater than the SA node, they assume pacemaking control and become the source of abnormal rhythm
- automaticity can be influenced by:
  - neurohormonal tone (sympathetic and parasympathetic stimulation)
  - abnormal metabolic conditions (hypoxia, acidosis, hypothermia)
  - electrolyte abnormalities
  - drugs (e.g. digitalis)
  - local ischemia/infarction
  - other cardiac pathology
- this mechanism is responsible for the accelerated idioventricular rhythm and ventricular tachycardia that often occurs 24 to 72 h post MI

## B. Triggered Activity due to Afterdepolarizations

### 1. Early Afterdepolarizations

- occur in the context of action potential prolongation
- consequence of the membrane potential becoming more positive during repolarization
- result in self-maintaining depolarizing oscillations of action potential, generating a tachyarrhythmia
- basis for the degeneration of QT prolongation, either congenital or acquired, into Torsades de Pointes

### 2. Delayed Afterdepolarizations

- occur after the action potential has fully repolarized, but before the next usual action potential, thus called a delayed afterdepolarization
- commonly occurs in situations of high intracellular calcium (digitalis intoxication, ischemia) or during enhanced catecholamine stimulation

## (II) Alterations in Impulse Conduction

### A. Re-Entry Circuits

- the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium
  - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable zones which will promote the formation of re-entry circuits

### B. Conduction Block

- ischemia, fibrosis, trauma, and drugs can cause transient, permanent, unidirectional or bidirectional block
- most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory period or zone of myocardium unexcitable due to fibrosis)
- if block occurs along the specialized conduction system distal zones of the conduction system can assume pacemaking control
- conduction block can lead to bradycardia or tachycardia when impaired conduction leads to re-entry phenomenon

### C. Bypass Tracts

- normally the only conducting tract from the atria to the ventricles is the AV node
- congenital/acquired accessory conducting tracts bypass the AV node and facilitate premature ventricular activation before normal AV node conduction
- see *Pre-Excitation Syndromes*, C18

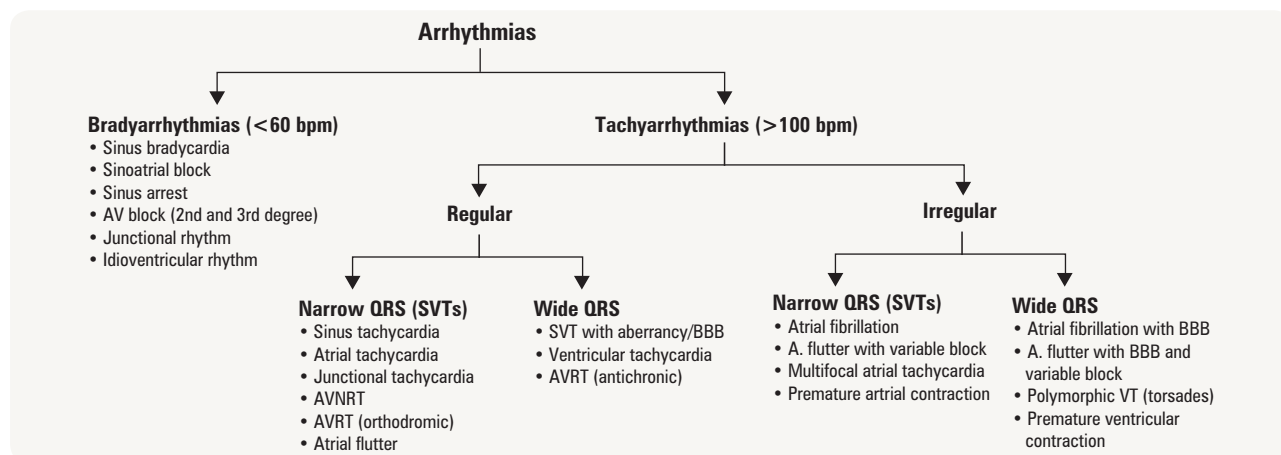

Figure 17. Clinical approach to arrhythmias

## Bradyarrhythmias

### Bradyarrhythmias

- Examples

### SA NODAL DYSFUNCTION

#### Sinus Bradycardia

- P axis normal (P waves positive in I and aVF)
- rate <60 bpm
- marked sinus bradycardia (<50 bpm) may be seen in normal adults, particularly athletes, and in elderly individuals
- caused by
  - increased vagal tone or vagal stimulation
  - vomiting
  - episodes of myocardial ischemia or infarction (inferior MI)
  - sick sinus syndrome
  - increased intracranial pressure
  - hypothyroidism
  - hypothermia
  - drugs (β-blockers, calcium channel blockers, etc.)
- treatment: if symptomatic, atropine during acute episodes; pacing for sick sinus syndrome; if drug-induced, reduction or withdrawal of drugs

#### Sinus Block, Pause, and Arrest

- three disorders involving the SA node; the sinus pacemaker fires but the impulse fails to depolarize the atrial myocardium resulting in no initial P wave (and consequently no QRS complex, ST segment, or T wave)
- sinus block (SA block), a complete block or failure of the sinus node to depolarize the atria; the block can last one or more cardiac cycles and is a multiple of the normal P-P interval
- sinus pause: a delay in the formation of a sinus impulse in the SA node resulting in a temporary pause (usually >3 s)
- sinus arrest: a longer delay in the formation of a sinus impulse in the SA node
  - there is no clear cut-off between sinus pause vs. arrest – if the pause lasts greater than 3x the normal P-P interval then it may be called an arrest
  - the P-P prolongation is not phasic or gradual (unlike sinus arrhythmia) and is not a multiple of the normal P-P interval (unlike sino-atrial block)
- escape beats or rhythm may occur:
- atrial escape: P waves with abnormal morphology
- junctional escape: P waves not seen, or follow the QRS (retrograde P), rate 40-60 bpm
- ventricular escape: no P wave; wide, abnormal QRS; slow rate 20-40 bpm

#### Sick Sinus Syndrome

- characterized by sinus node dysfunction (marked bradycardia, sinus pause/arrest, sinoatrial block)
  - when symptomatic, electronic pacemaker is indicated
- frequently associated with episodes of atrial tachyarrhythmias (“tachy-brady syndrome”)
- usually require a combination of a pacemaker for bradycardia and medications (β-blocker, calcium channel blocker, and/or digoxin, initiated after pacemaker insertion) for tachycardia

#### Sinus Arrhythmia (SA)

- Normal P waves, with variation of the P-P interval by >120 msec due to varying rate of SA node

#### Respiratory SA

- Seen more often in young adults (<30 yr old)
- Normal, results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

#### Non-respiratory SA

- Seen more often in the elderly
- Can occur in the normal heart; if marked may be due to sinus node dysfunction (e.g. in heart disease, or after digitalis toxicity)
- Usually does not require treatment

## AV Conduction Blocks

#### First Degree AV Block

- prolonged PR interval (>200 msec)
- frequently found among otherwise healthy adults
- no treatment required

#### Second Degree AV Block

- some of the atrial impulses are not conducted to the ventricles
- can describe block by ratio of number of P waves to number of QRS (e.g. 2:1, 3:1, 4:1 increases in severity)
- second degree AV block is further subdivided into Type I and Type II block:
  - Type I (Mobitz I) second degree AV block
    - ♦ a gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)
    - ♦ AV block is usually in AV node (proximal)
      - triggers (usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia
      - not an indication for temporary or permanent pacing

Figure 18. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V<sub>1</sub>)

- Type II (Mobitz II) second degree AV block
  - ♦ the PR interval is constant; there is an abrupt failure of conduction of a P wave
  - ♦ AV block is usually distal to the AV node (i.e. His bundle)
  - ♦ increased risk of high grade or 3rd degree AV block

Figure 19. Second degree AV block (Mobitz II) (3:2 conduction) (lead V<sub>1</sub>)

### 2:1 AV Block

- often not possible to determine whether the block is type I or type II
- prolonged or repeated recordings may clarify the diagnosis

Figure 20. 2:1 AV block (lead II)

### Third Degree AV Block

- complete failure of conduction of the supraventricular impulses to the ventricles
- ventricular depolarization initiated by an escape pacemaker distal to the block
- QRS can be narrow or wide (junctional vs. ventricular escape rhythm)
- P-P and R-R intervals are constant, variable PR intervals
- no relationship between P waves and QRS complexes (P waves “marching through”)
- management (see *Electrical Pacing*, C21)

Figure 21. Third degree AV block (complete heart block) (lead II)

## Supraventricular Tachyarrhythmias

**Tachyarrhythmias**  
• Examples

### Presentation for SVT (and pre-excitation syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate congestive heart failure (CHF), hypotension or ischemia in patients with underlying disease
- untreated tachycardias can cause cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- includes supraventricular and ventricular rhythms

### Supraventricular Tachyarrhythmias (SVT)

- tachyarrhythmias that originate in the atria or AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS, unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

### Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- occurs in normal subjects with increased sympathetic tone (exercise, emotions, pain), alcohol use, caffeinated beverages, drugs (e.g.  $\beta$ -adrenergic agonists, anticholinergic drugs, etc.)
- etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, PE, etc.
- treatment: treat underlying disease; consider  $\beta$ -blocker if symptomatic, calcium channel blocker if  $\beta$ -blockers contraindicated

### Premature Beats

- premature atrial contraction (PAC) (Figure 27)
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex
- treatment usually not required

### Atrial Flutter

- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly the right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (2:1, 3:1, 4:1, etc.) or variable
- etiology: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy) (see Figure 22)
- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and bring out flutter waves
- treatment
  - acute: if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable
    - rate control:  $\beta$ -blocker, diltiazem, verapamil, or digoxin
    - chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
  - anticoagulation guidelines same as for patients with AFib (see *Atrial Fibrillation*, below)
  - long-term: antiarrhythmics, catheter radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter)

### Multifocal Atrial Tachycardia (MAT)

- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm; at least 3 distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD, and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil),  $\beta$ -blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics or ablation

### Atrial Fibrillation (AFib)

- see *CCS Atrial Fibrillation Guidelines 2012* for details (free mobile apps available on iOS, Android and Blackberry)
- most common sustained arrhythmia
- incidence increases with age (10% of population >80 yr old)
- symptoms: palpitations, fatigue, syncope, may precipitate or worsen heart failure
- classification:
  - chronic/permanent: continuous atrial fibrillation that is unresponsive to cardioversion; cardioversion will not be reattempted
  - lone: occurs in persons younger than 60 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: atrial fibrillation sustained for more than 7 d or atrial fibrillation that terminates only with cardioversion
  - recurrent: two or more episodes of atrial fibrillation
  - secondary: caused by a separate underlying condition or event (e.g. myocardial infarction, cardiac surgery, pulmonary disease, hyperthyroidism)
  - may be associated with thromboembolic events (4%/yr in nonvalvular AFib)
- initiation
  - single circuit re-entry and/or ectopic foci act as aberrant generators producing atrial tachycardia (350-600 bpm)
  - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
  - in some cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- maintenance
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib the more difficult it is to convert back to sinus rhythm
- consequences
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response of <200 bpm and the tachycardia leads to suboptimal cardiac output
  - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation – AFib is an important risk factor for stroke

**Figure 22. Atrial flutter with variable block**

#### CHA2DS2-VASc Score

The European Society of Cardiology (ESC) and the Canadian Cardiovascular Society (CCS) have incorporated the Birmingham 2009 schema (CHA2DS2-VASc) for the prediction of stroke risk in latest guidelines. The CHADS2 (Table 3) score is to be applied first; followed by the VASc schema if the score is <2 to further grade the risk of stroke in patients at low risk. A score of 0 indicates the patient is very low risk of stroke and may require either ASA alone or no antithrombotic therapy, with the latter preferred. A score of 1 indicates the utility of either ASA or an oral anticoagulant, with the latter preferred. A patient with a score of  $\geq 2$  should receive an oral anticoagulant. For more information, please see **Focused 2012 Update of the CCS AF Guidelines**, *Can J Cardiol* 2012;28:125-136.

#### Rivaroxaban for Stroke Prevention in Atrial Fibrillation – ROCKET-AF Trial

*NEJM* 2011;365:883-891

**Study:** Prospective, non-inferiority, double blind, RCT, median follow-up of 1.9 yr.

**Population:** 14,264 patients with atrial fibrillation (mean CHADS2 = 3.5). Patients either had previous thromboembolism or  $\geq 3$  risk factors.

**Intervention:** Patients were randomized to receiving rivaroxaban or warfarin.

**Outcome:** Composite of strokes and systemic thromboembolic event (STE).

**Results:** The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.88; 95% CI, 0.74-1.03;  $P < 0.001$  for noninferiority;  $P = 0.12$  for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03; 95% CI, 0.96-1.11;  $P = 0.44$ . There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%,  $P = 0.02$ ) and fatal bleeding (0.2% vs. 0.5%,  $P = 0.003$ ) for rivaroxaban.

**Conclusions:** In patients with atrial fibrillation, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.

**Table 3. CHADS2 Risk Prediction for Non-Valvular AFib**

Risk Factor	Points	CHADS2 Score	Stroke Risk (%/Yr)	Anticoagulation Recommendation
Congestive Heart Failure	1	0	1.9 (low)	ASA 81-325 mg OD
Hypertension	1	1	2.8 (low -mod)	oral anticoagulants*
Age >75	1	2-3	4.0-5.9 (mod)	oral anticoagulants*
Diabetes	1	4-6	8.5-18.2 (high)	oral anticoagulants*
Stroke/TIA (prior)	2			

JAMA 2001;285:2864-70 and Canadian Journal of Cardiology 2012;28:125-136  
 Oral anticoagulants \* currently includes warfarin (INR 2-3), dabigatran, rivaroxaban

### AFib on ECG

- no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
- irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
- loss of atrial contraction, thus no "a" wave seen in JVP, no S4 on auscultation

**Figure 23. Atrial fibrillation (lead II)**

### Management (adapted from CCS Atrial Fibrillation Guidelines 2012)

**Major objectives (RACE):** all patients with AF (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and for the risk of bleeding, and most patients should receive either an oral anticoagulant or ASA (see Table 3)

1. Rate control:  $\beta$ -blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
2. Anticoagulation: use either warfarin, dabigatran, rivaroxaban, apixaban to prevent thromboembolism
3. Cardioversion (electrical)
  - if AFib <24-48 h, can usually cardiovert without anticoagulation
  - if AFib >24-48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion
  - if patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
4. Etiology
  - HTN, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
  - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease

### Additional Management Points Regarding AFib

- studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control versus rate-control strategy
- however, many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible

### Newly Discovered AFib

- anticoagulants may be beneficial if high risk for stroke
- if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
- if AFib persists, 2 options:
  1. rate control and anticoagulation (as indicated above)
  2. cardioversion (as above)

### Recurrent AFib/Permanent AFib

- if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
- patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence: permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations

#### Atrial Fibrillation – AFFIRM Trial

NEJM 2002;347:1825-1833

**Study:** Randomized, multicenter trial with mean follow-up of 3.5 yr.

**Population:** 4060 patients (mean age 70 yr, 61% male, 89% white) with AF and a high risk of stroke or death.

**Intervention:** Rate control ( $\beta$ -blockers, calcium channel blockers, or digoxin alone or in combination) vs. rhythm control (antiarrhythmic drug chosen by the treating physician).

**Primary Outcome:** All cause mortality.

**Results:** There was no difference in mortality or disabling stroke, anoxic encephalopathy, major bleeding, and cardiac arrest between the two groups. There were more incidents of hospitalizations (80.1% vs. 73%,  $p < 0.001$ ) and adverse events (Torsades de Pointes (12 vs. 2,  $p = 0.007$ ), pulseless or bradycardic arrest (9 vs. 1,  $p = 0.01$ ), pulmonary event (108 vs. 24,  $p < 0.001$ ), gastrointestinal event (127 vs. 35,  $p < 0.001$ ), prolonged QT interval (31 vs. 4,  $p \leq 0.001$ ), bradycardia (105 vs. 64,  $p = 0.001$ ) in the rhythm-control group.

**Conclusion:** Rate-control was as effective as rhythm-control in AF and was better tolerated. There were more hospitalization incidents in the rhythm-control group.

#### Oral Anticoagulants versus Antiplatelet Therapy for Preventing Stroke in Patients with Non-Valvular Atrial Fibrillation and No History of Stroke or Transient Ischemic Attacks

Cochrane DB Syst Rev 2009;3:CD006186

**Study:** Cochrane DB Syst Rev 8 RCTs with mean 1.9 yr of follow-up.

**Population:** 9598 total patients with non-valvular AF and no history of stroke or transient ischemic attack.

**Intervention:** Long-term adjusted-dose warfarin versus ASA (dose ranging from 75 to 325 mg).

**Outcome:** All cause mortality, all stroke, vascular death, MIs.

**Results:** Dose-adjusted warfarin therapy significantly reduced all stroke (OR 0.68, 95% CI 0.54-0.85), ischemic stroke (OR 0.53, 95% CI 0.41-0.68), and systemic emboli risk (OR 0.48, 95% CI 0.25-0.90). There was no significant difference in disabling or fatal strokes, MI, vascular death or all cause mortality. There was a significantly increased risk of intracranial hemorrhage with warfarin therapy versus ASA (OR 1.98, 95% CI 1.20-3.28).

**Conclusion:** Long-term adjusted-dose warfarin significantly reduces all stroke and embolic risks but does not reduce risk of disability or mortality and carries a significant intracranial hemorrhage risk. The threshold of benefit for anticoagulation versus antiplatelet therapy remains controversial.

- if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
  - no or minimal heart disease: flecainide, propafenone or sotalol
  - LV dysfunction: amiodarone
  - CAD:  $\beta$ -blockers, amiodarone

### AV Nodal Re-Entrant Tachycardia (AVNRT)

- re-entrant circuit using dual pathways (fast conducting  $\beta$ -fibres and slow conducting  $\alpha$ -fibres) within or near the AV node; often found in the absence of structural heart disease – cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset
- fast regular rhythm: rate 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex (see Figure 24)
- treatment
  - acute: Valsalva or carotid massage, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina or CHF)
  - long-term: 1st line –  $\beta$ -blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone; 3rd line – catheter ablation

The carotid massage is a constant pressure directed posteriorly against the carotid artery for 5-10 s. Always listen for bruits before palpation.

Figure 25. Mechanism for AVNRT

Figure 24. AVNRT

## Pre-Excitation Syndromes

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

### Wolff-Parkinson-White (WPW) Syndrome

- congenital defect present in 1.5-2/1000 of the general population
- an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively 'bypassing' AV node
- since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called "delta wave"
- atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad "fusion complex"
- ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur – most often AVRT and AFib

Figure 26. Accessory pathway conduction in WPW causes early ventricular activation leading to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction occurs across the AV node

### AFib in WPW Patients

- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - it is usually intermittent rather than persistent or permanent
- rapid atrial depolarizations in AFib are conducted through the bypass tract which is not able to filter impulses like the AV node can
- consequently the ventricular rate becomes extremely rapid ( $>200$  bpm) and the QRS complex widens
- treatment: electrical cardioversion, IV procainamide or IV amiodarone
  - do not use drugs that slow AV node conduction (digoxin,  $\beta$ -blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
  - long-term: ablation of bypass tract if possible

### AV Re-Entrant Tachycardia (AVRT)

- re-entrant loop via accessory pathway and normal conduction system
- initiated by a premature atrial or ventricular complex
- **orthodromic AVRT**: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system) (see Figure 28)
  - comprises 95% of the reentrant tachycardias associated with WPW syndrome
- **antidromic AVRT**: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
- treatment
  - acute: similar to AVNRT except avoid long-acting AV nodal blockers, e.g. digoxin and verapamil
  - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
    - ♦ drugs such as flecainide and procainamide can be used

**Figure 27. PVC (with bigeminy pattern) and PAC**

**Figure 28. Orthodromic vs. antidromic AVRT**

## Ventricular Tachyarrhythmias

### Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)

- QRS width  $>120$  msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign but are usually significant in the following situations:
  - consecutive ( $\geq 3 =$  VT) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate ventricular tachycardia or VF

### Accelerated Idioventricular Rhythm

- ectopic ventricular rhythm with rate 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment

### Ventricular Tachycardia (VT)

- 3 or more consecutive ectopic ventricular complexes (Figure 29)
  - rate  $>100$  bpm (usually 140-200)
  - ventricular flutter: if rate  $>200$  bpm and complexes resemble a sinusoidal pattern
  - "sustained VT" if it lasts longer than 30 s
  - ECG characteristics: wide regular QRS tachycardia (QRS usually  $>140$  msec); AV dissociation; bizarre QRS pattern. Also favour Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")
- **monomorphic VT**
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - typically result from intraventricular re-entry circuit
  - potential causes: chronic infarct scarring, acute MI/ischemia, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances
- **polymorphic VT**
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
  - potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation (see *Torsades de Pointes*, C20)

- treatment
  - sustained VT (>30 s) is an emergency, requiring immediate treatment
  - hemodynamic compromise: electrical cardioversion
  - no hemodynamic compromise: electrical cardioversion, lidocaine, amiodarone, type Ia agents (procainamide, quinidine)

**Figure 29. Ventricular tachycardia (monomorphic)**

**Table 4. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy\***

Clinical Clues		ECG Clues	
Presenting symptoms	Not helpful	AV dissociation	VT
History of CAD and previous MI	VT	Capture or fusion beats	VT
Physical exam		QRS width > 140 msec	VT
Cannon "a" waves Variable S1	VT	Extreme axis deviation (left or right superior axis)	VT
Carotid sinus massage/adenosine terminates arrhythmia	SVT**	Positive QRS concordance (R wave across chest leads)	VT
		Negative QRS concordance (S wave across chest leads)	May suggest VT
		Axis shift during arrhythmia	VT (polymorphic)

\*If patient > 65 and previous MI or structural heart disease, then chance of VT > 95%

\*\*May terminate VT in some patients with no structural heart disease

### Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – “twisting of the points” (Figure 30)
- looks like usual VT except that QRS complexes “rotate around the baseline” changing their axis and amplitude
- ventricular rate >100 bpm, usually 150-300 bpm
- etiology: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing, isoproterenol and correct underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

**Figure 30. Torsades de pointes**

### Ventricular Fibrillation (VFib)

- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology (Figure 31)
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and cardiac output, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines

**Figure 31. Ventricular fibrillation**

#### Arrhythmias that May Present as a Wide QRS Tachycardia

- Ventricular tachycardia
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see Pre-excitation Syndromes, C18)

## Electrophysiology (EPS) Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of ventricular tachycardia

## Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

### Pacemaker Indications

- SA node dysfunction (most common): symptomatic bradycardia  $\pm$  hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

### Pacemaker Complications

- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome and pacemaker mediated tachycardia

### Pacing Techniques

- temporary: transvenous (jugular, subclavian, femoral) or external pacing
- permanent: transvenous into RA, apex of RV or both
- can sense and pace atrium, ventricle or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

## Implantable Cardioverter Defibrillators (ICDs)

- sudden cardiac death (SCD) usually results from ventricular fibrillation (VFib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see *Heart Failure*, C30 for current treatment recommendations

## Catheter Ablation

### Techniques

- radiofrequency (RF) energy: a low-voltage high-frequency form of electrical energy (similar to cautery). RF energy produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth

### Indications

- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm, with an accessory AV connection as the retrograde limb
  - corrected by targeting the accessory pathway
- atrial flutter: flutter focus in RA
- AFib: potential role for pulmonary vein ablation
- ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated)

### CCS Consensus Conference 2003: Assessment of the Cardiac Patient for Fitness to Drive and Fly – Executive Summary

*Can J Cardiol* 2004;20:1313-1323

In both primary and secondary prevention ICD patients with private driving licenses, no restrictions to drive directly following implantation or an inappropriate shock are warranted. However, following an appropriate shock these patients are at an increased risk to cause harm to other road users and therefore should be restricted to drive for a period of 2 and 4 mo, respectively. In addition, all ICD patients with commercial driving licenses have a substantial elevated risk to cause harm to other road users during the complete follow-up after both implantation and shock and should therefore be restricted to drive permanently.

### Systematic Review: Implantable Cardioverter Defibrillators for Adults with Left Ventricular Systolic Dysfunction

*Ann Intern Med* 2007;147:251-62

**Study:** Meta-review of 12 RCTs used for ICD efficacy, 5 RCTs and 48 observational studies for effectiveness, and 21 RCTs and 43 observational studies for safety review.

**Population:** 8516 patients for ICD efficacy, 26,840 patients for effectiveness, and 86,809 patients for safety review with left ventricular ejection fraction  $\leq 0.35$ .

**Intervention:** ICD implantation.

**Outcomes:** All-cause mortality and adverse events

**Results:** ICDs reduced all-cause mortality by 20% (95% CI, 10%-29%;  $I^2 = 44.4\%$ ) with greatest reduction (54%) in sudden cardiac death (CI, 37%-63%;  $I^2 = 0\%$ ). Observational studies had a reduced relative risk of 0.54 for all-cause mortality versus RCTs (CI 0.43-0.58,  $I^2 = 60.4\%$ ). Rates of success of ICD implantation were 99% (CI 98.8%-99.3%) with a 1.2% (CI 0.9%-1.5%) chance of peri-implantation death. Post-implantation complications (per 100 patient-yr) were: 1.4 (CI 1.2-1.6) device malfunctions; 1.5 (CI 1.3-1.8) lead problems; 0.6 (CI 0.5-0.8) implant site infection and 19.1 (CI 16.5-22.0) inappropriate discharges in RCTs versus a rate of 4.9 (CI 4.5-5.3) inappropriate discharges in observational studies.

**Conclusion:** ICDs are safe and effective in reducing mortality in adult patients with LV systolic dysfunction but carry significant risks of inappropriate discharges. Differences between RCTs and observational studies show that improved risk stratification of patients may further improve outcomes and reduce adverse events.

### Major Complications

- 1% of patients
- death: 0.1-0.2%
- cardiac: high grade AV block requiring permanent pacemaker, tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

## Ischemic Heart Disease

### Epidemiology

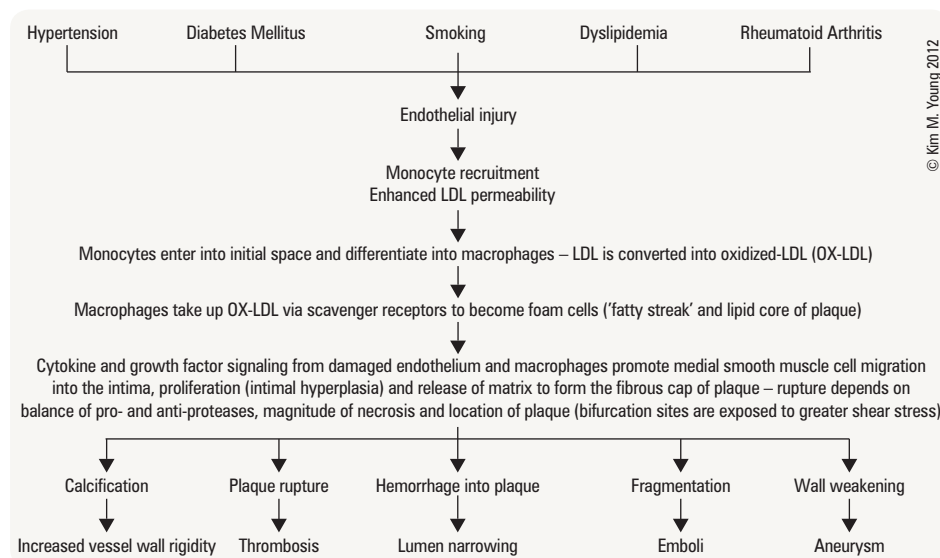

- most common cause of cardiovascular morbidity and mortality
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- male:female ratio = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease please see [Family Medicine](#), FM19

**Table 5. Risk Factors and Markers for Atherosclerotic Heart Disease**

Non-modifiable Risk Factors	Modifiable Risk Factors	Markers of Disease
Age	Hyperlipidemia*	Elevated lipoprotein(a)
Male, postmenopausal female	Hypertension (HTN)*	Hyperhomocysteinemia
Family history (FHx) of MI*	Diabetes mellitus (DM)*	Elevated high-sensitivity C-reactive protein (hsCRP)
First degree male relative <55	Cigarette smoking*	Coronary artery calcification
First degree female relative <65	Metabolic syndrome	
	Obesity	
	Sedentary lifestyle	
	Heavy alcohol intake	

\* Major risk factor

**Figure 32. Pathophysiology of atherosclerosis**

## Chronic Stable Angina

### Definition

- symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

### Etiology and Pathophysiology

- factors that decrease myocardial oxygen supply
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased SaO<sub>2</sub>: hypoxemia
  - congenital anomalies

Chronic stable angina is most often due to a fixed stenosis caused by an atheroma.

Acute coronary syndromes are the result of plaque rupture.

- factors that increase myocardial oxygen demand
  - increased heart rate: hyperthyroidism
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, aortic stenosis

### Signs and Symptoms

- typical: retrosternal chest pain, tightness or discomfort radiating to left ( $\pm$  right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety
- predictably precipitated by the “3 Es”: exertion, emotion, eating
- brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- Levine’s sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

### Clinical Assessment

- history including directed risk factor assessment and physical exam
- labs: Hb, associated with diaphoresis, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- stress testing (see *Cardiac Diagnostic Tests*, C5) or angiography
- echo
  - to assess systolic murmur suggestive of aortic stenosis, mitral regurgitation and/or HCM
  - to assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of congestive heart failure (CHF)

### Differential Diagnosis

- see *Differential Diagnosis of Common Presentations*, C4

### Treatment of Chronic Stable Angina

#### 1. General measures

- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise)
- treatment of risk factors: statins (see [Endocrinology](#), E5, [Family Medicine](#), FM9 for target lipid guidelines), antihypertensives, etc.

#### 2. Antiplatelet therapy (first-line therapy)

- ASA
- clopidogrel when ASA absolutely contraindicated

#### 3. $\beta$ -blockers (first-line therapy – decrease overall mortality)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via  $\beta_2$  receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

#### 4. Nitrates (symptomatic control, no clear impact on survival)

- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

#### 5. Calcium channel blockers (CCBs, second-line or combination)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with  $\beta$ -blockers may cause symptomatic sinus bradycardia or AV block

#### 6. ACE inhibitors (ACEI, not used to treat symptomatic angina)

- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. hypertension, diabetes, proteinuric renal disease, previous MI with LV dysfunction)
- benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction or LV systolic dysfunction)
- angiotensin II receptor blockers (ARBs) can be used when ACEI contraindicated (e.g. hypersensitivity, angioedema)

#### 7. Invasive strategies

- revascularization (see *Coronary Revascularization*, C28 and *COURAGE trial* sidebar)

### VARIANT ANGINA (Prinzmetal’s Angina)

- myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 AM, unrelated to exercise, relieved by nitrates
- typically ST elevation on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs

### SYNDROME X

- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

#### Canadian Cardiovascular Society (CCS) Functional Classification of Angina

- **Class I:** ordinary physical activity (walking, climbing stairs) does not cause angina; angina with strenuous, rapid, or prolonged activity
- **Class II:** slight limitation of ordinary activity: angina brought on at >2 blocks on level or climbing >1 flight of stairs or by emotional stress
- **Class III:** marked limitation of ordinary activity: angina brought on at <2 blocks on level or climbing <1 flight of stairs
- **Class IV:** inability to carry out any physical activity without discomfort; angina may be present at rest

#### Optimal Medical Therapy with or without PCI for Stable Coronary Disease. COURAGE Trial

NEJM 2007;356:1503-16

**Study:** Randomized, controlled trial with median follow-up of 4.6 yr.

**Population:** 2287 patients who had objective evidence of myocardial ischemia and significant stable coronary artery disease.

**Intervention:** Patients were randomized to receive intensive pharmacologic therapy and lifestyle intervention with or without percutaneous coronary intervention (PCI).

**Outcome:** Primary outcome was all-cause mortality and nonfatal myocardial infarction (MI). Secondary outcome had additional events of stroke, all MI, and hospitalization for unstable angina with negative biomarkers.

**Results:** There was no significant difference in primary (unadjusted hazard ratio: 1.05;  $p=0.62$ ) or secondary outcomes (hazard ratio: 1.05;  $p=0.62$ ) between the PCI and non-PCI intervention groups. The PCI group had significantly lower rates of subsequent revascularization at 4.6 yr of follow-up (hazard ratio 0.60,  $p<0.001$ ) and was more angina-free in the first 4 yr of follow-up.

**Conclusions:** PCI as an adjunct in initial management in patients with significant stable coronary artery disease does not reduce mortality, MI, stroke or hospitalization for ACS, but does provide angina relief and reduced risk of revascularization.

## Acute Coronary Syndromes (ACS)

### Definition

- ACS includes the spectrum of UA, NSTEMI and STEMI. This distinction aids in providing the appropriate therapeutic intervention
  - MI is defined by evidence of myocardial necrosis. It is diagnosed by a rise/fall of serum markers plus any one of:
    - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
    - ECG changes (ST-T changes, new BBB or pathological Q waves)
    - imaging evidence (myocardial loss of viability, wall motion abnormality or intracoronary thrombus)
  - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
  - NSTEMI meets criteria for myocardial infarction without ST elevation or BBB
  - STEMI meets criteria for myocardial infarction characterized by ST elevation or new BBB
- UA is clinically defined by any of the following:
  - accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
  - angina at rest
  - new-onset angina
  - angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery bypass grafting [CABG])

### Investigations

- history and physical
  - note that up to 30% of MIs are unrecognized or “silent” due to atypical symptoms – more common in women, DM, elderly, post-heart transplant (because of denervation)
- ECG
- CXR
- labs
  - serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see *Cardiac Biomarkers*, C9)
  - CBC, INR/PTT, electrolytes and magnesium, creatinine, urea, glucose, serum lipids
  - draw serum lipids within 24–48 h because values are unreliable from 2–48 d post-MI

## MANAGEMENT OF ACUTE CORONARY SYNDROMES

### 1. General measures

- ABCs: assess and correct hemodynamic status first
- bed rest, cardiac monitoring, oxygen
- nitroglycerin SL followed by IV
- morphine IV

### 2. Anti-platelet and anticoagulation therapy

- ASA 162–325 mg chewed
- NSTEMI
  - clopidogrel 300 mg loading dose, then 75 mg QD in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight heparin or IV unfractionated heparin (UFH) (LMWH preferable, except in renal failure or if CABG is planned within 24 h)
- if PCI is planned: clopidogrel 300 mg loading dose and IV GP IIb/IIIa inhibitor (e.g. abciximab)
- anticoagulation options depend on reperfusion strategy:
  - primary PCI: UFH during procedure; bivalirudin is a possible alternative
  - thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  - no reperfusion: LMWH (enoxaparin) until discharge from hospital
- continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)

### 3. $\beta$ -blockers

- first dose IV followed by oral administration
- STEMI: contraindications include signs of heart failure, low output states, risk of cardiogenic shock, heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated
- if  $\beta$ -blockers are contraindicated or if  $\beta$ -blockers/nitrates fail to relieve ischemia, non-dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel blockers do not prevent MI or decrease mortality)

#### Is this Patient Having a Myocardial Infarction? From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3484335>

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of an acute myocardial infarction.

**Results:** In patients with normal or non-diagnostic ECG, no established CAD, and prolonged or recurrent chest pain typical of their usual discomfort, radiation of pain to the shoulder OR both arms had the highest positive likelihood ratio (+LR) of 4.1 (95% CI, 2.5–6.5) and a negative likelihood ratio (–LR) of 0.68 (95% CI, 0.52–0.89). Radiation to right arm had a +LR of 3.8 (95% CI, 2.2–6.6) and –LR of 0.86 (95% CI, 0.77–0.96), vomiting had a +LR of 3.5 (95% CI, 2.0–6.2) and –LR of 0.87 (95% CI, 0.79–0.97), while radiation to left arm only had a +LR of 1.3 (95% CI, 0.93–1.8) and a –LR of 0.9 (95% CI, 0.76–1.1).

**Conclusions:** The most compelling features that increase likelihood of an MI are ST-segment and cardiac enzyme elevation, new Q-wave, and presence of an S3 heart sound. In patients where the diagnosis of MI is uncertain, radiation of pain to the shoulder OR both arms, radiation to the right arm, and vomiting had the best predictive values, while radiation to the left arm is relatively non-diagnostic.

#### TIMI Risk Score for UA/NSTEMI

Characteristics	Points
<b>Historical</b>	
Age $\geq 65$ yr	1
$\geq 3$ risk factors for CAD	1
Known CAD (stenosis $\geq 50\%$ )	1
Aspirin <sup>®</sup> use in past 7 d	1
<b>Presentation</b>	
Recent ( $\leq 24$ h) severe angina	1
ST-segment deviation $\geq 0.5$ mm	1
Increased cardiac markers	1

Risk Score = Total Points

If TIMI risk score  $\geq 3$ , consider early LMWH and angiography

TIMI = thrombolysis in myocardial infarction

UA = unstable angina

JAMA 2000;284:835–842

#### Treatment of NSTEMI

##### BEMOAN

$\beta$ -blocker  
Enoxaparin  
Morphine  
O<sub>2</sub>  
ASA  
Nitrates

#### 4. Invasive strategies and reperfusion options

- **UA/NSTEMI:** early coronary angiography ± revascularization if possible is recommended with any of the following high-risk indicators:
  - ♦ recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  - ♦ CHF or LV dysfunction
  - ♦ hemodynamic instability
  - ♦ high ( $\geq 3$ ) TIMI risk score (tool used to estimate mortality following an ACS)
  - ♦ sustained ventricular tachycardia
  - ♦ dynamic ECG changes
  - ♦ high-risk findings on non-invasive stress testing
  - ♦ PCI within the previous 6 mo
  - ♦ repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high risk features
  - ♦ note: thrombolysis is NOT administered for UA/NSTEMI
- **STEMI**
  - ♦ after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - ♦ goal is to re-perfuse artery: thrombolysis (“EMS-to-needle”) within 30 min or primary PCI (“EMS-to-balloon”) within 90 min (depending on capabilities of hospital and access to hospital with PCI facility)
  - ♦ thrombolysis
    - preferred if patient presents  $\leq 12$  h of symptom onset, and  $< 30$  min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
  - ♦ PCI
    - early PCI ( $\leq 12$  h after symptom onset and  $< 90$  min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
    - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centres (*JAMA* 2004; 291:736-39)
    - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

#### Enoxaparin versus Unfractionated Heparin with Fibrinolysis for ST-elevation Myocardial Infarction

*NEJM* 2006;354:1477-88

**Study:** Prospective multicenter RCT.

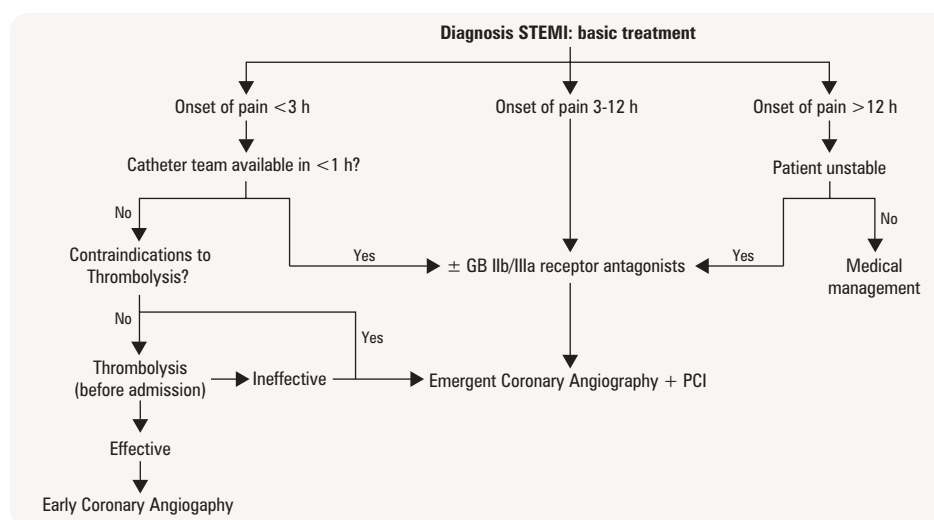

**Patients:** 20,479 patients (median age 60 yr, 77% male) with STEMI who were scheduled to undergo fibrinolysis.

**Intervention:** Patients were randomized to receive either enoxaparin or weight based unfractionated heparin in addition to thrombolysis and standard therapies.

**Primary Outcome:** Death or recurrent nonfatal MI 30 d post-event.

**Results:** The composite primary outcome occurred less often in the enoxaparin group compared with those who received unfractionated heparin (9.9% vs. 12.0%,  $p < 0.001$ , NNT=47). Taken separately, there was a trend toward reduced mortality (6.9% vs. 7.5%,  $p = 0.11$ ) and a significant reduction in nonfatal reinfarction (3.0% vs. 4.5%,  $p < 0.001$ ) in the enoxaparin group. The risk of major bleeding was significantly increased in the enoxaparin group (2.1% vs. 1.4%,  $p < 0.001$ , NNH=142).

**Conclusion:** In patients with STEMI receiving thrombolysis, enoxaparin is superior to unfractionated heparin in preventing recurrent nonfatal MI and may lead to a small reduction in mortality.

**Figure 33. Reperfusion strategy in STEMI**

**Table 6. Contraindications for Thrombolysis in STEMI**

Absolute	Relative
Prior intracranial hemorrhage	Chronic, severe, poorly controlled HTN
Known structural cerebral vascular lesion	Uncontrolled HTN (sBP > 180, dBP > 110)
Known malignant intracranial neoplasm	Current anticoagulation
Significant closed-head or facial trauma ( $\leq 3$ mo)	Noncompressible vascular punctures
Ischemic stroke ( $\leq 3$ mo)	Ischemic stroke ( $\geq 3$ mo)
Active bleeding	Recent internal bleeding ( $\leq 2-4$ wk)
Suspected aortic dissection	Prolonged CPR or major surgery ( $\leq 3$ wk)
	Pregnancy
	Active peptic ulcer disease

## Long-Term Management of ACS

- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge work-up: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

### 1. General Measures

- education
- risk factor modification

### 2. Antiplatelet and Anticoagulation Therapy

- ECASA 75-162 mg daily
- clopidogrel 75 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
- prasugrel 10 mg daily or ticagrelor 90 mg twice daily can be used as alternatives to clopidogrel when indicated
- $\pm$  warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)

### 3. $\beta$ -Blockers (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

### 4. Nitrates

- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

### 5. Calcium Channel Blockers (NOT recommended as first line treatment, consider as alternative to $\beta$ -blockers)

### 6. Angiotensin-Converting Enzyme Inhibitors (ACEI)

- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- recommended for symptomatic CHF, reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI

### 7. $\pm$ Aldosterone Antagonists

- if on ACEI and  $\beta$ -blockers and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

### 8. Statins (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

### 9. Invasive Cardiac Catheterization if indicated (risk stratification, see Figure 34)

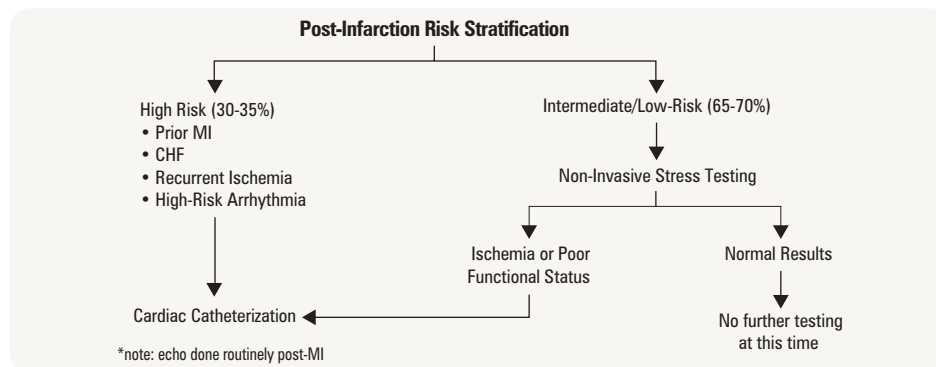

Figure 34. Post-MI risk stratification

## Prognosis following STEMI

- 5-15% of hospitalized patients will die
  - risk factors
    - ♦ infarct size/severity
    - ♦ age
    - ♦ co-morbid conditions
    - ♦ development of heart failure or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 months
  - 4% per year following first year
  - risk factors
    - ♦ LV dysfunction
    - ♦ residual myocardial ischemia
    - ♦ ventricular arrhythmias
    - ♦ history of prior MI

### Intensive versus Moderate Lipid Lowering with Statins after Acute Coronary Syndromes

NEJM 2004;350:1495-1504

**Study:** Prospective, double blind, RCT; mean follow-up of 2 yr.

**Population:** 4,162 patients who had been hospitalized for an ACS within the preceding 10 d.

**Intervention:** Patients were randomized to receiving pravastatin 40 mg or atorvastatin 80 mg daily.

**Primary Outcome:** Composite of death from any cause, myocardial infarction, documented unstable angina requiring rehospitalization, revascularization (performed at least 30 d after randomization), and stroke.

**Results:** High dose atorvastatin was associated with a 16% hazard ratio reduction ( $P=0.005$ ; 95% CI, 5-26%) in the primary outcome compared to standard dose pravastatin.

**Conclusions:** In patients whom recently experienced an ACS, high dose statin therapy provides greater protection against death and major cardiovascular events than standard dose therapy.

Resting LVEF is a useful prognostic factor.

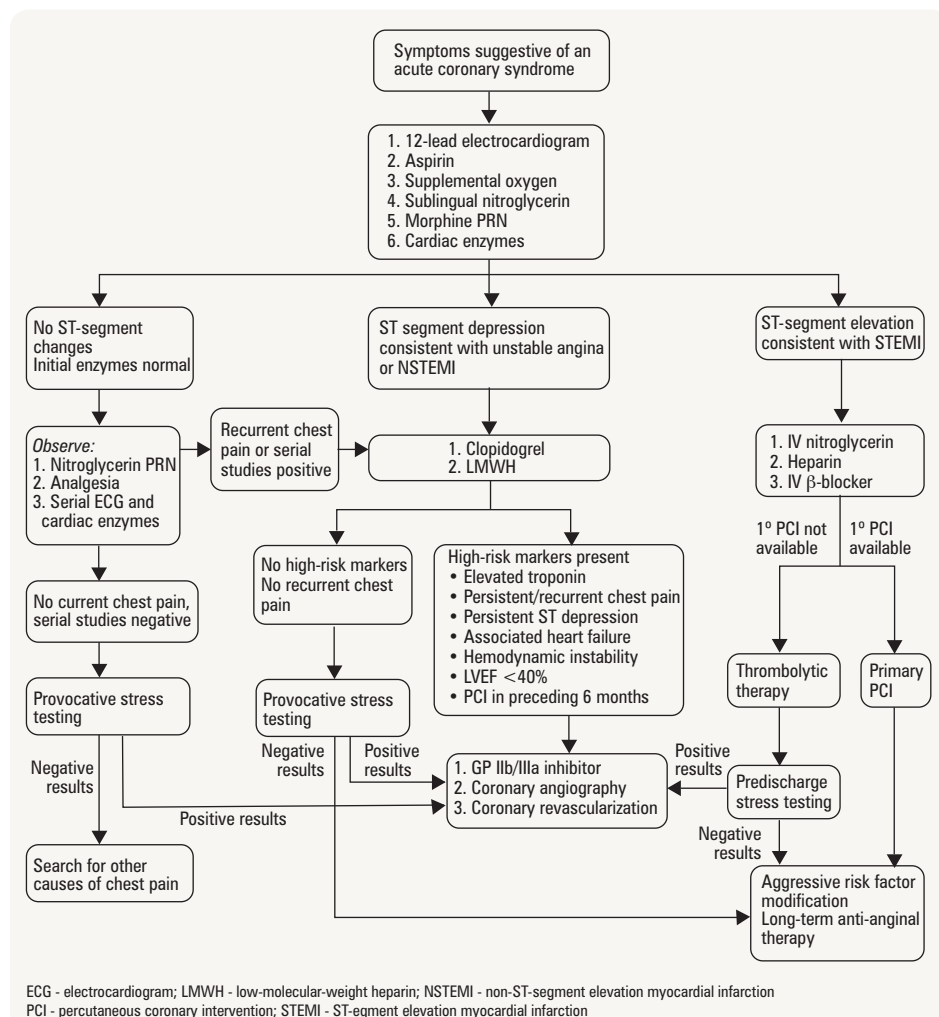

**Table 7. Complications of Myocardial Infarction**

Complication	Etiology	Presentation	Therapy
<b>Arrhythmia</b> 1. Tachycardia 2. Bradycardia	Sinus, AFib, VT, VFib Sinus, AV block	First 48 h First 48 h	See <i>Arrhythmias</i> , C12
<b>Myocardial Rupture</b> 1. LV free wall 2. Papillary muscle (→ MR) 3. Ventricular septum (→ VSD)	Transmural infarction Inferior infarction Septal infarction	1-7 d 1-7 d 1-7 d	Surgery Surgery Surgery
<b>Shock/CHF</b>	Infarction or aneurysm	Within 48 h	Inotropes, intra-aortic balloon pump
<b>Post-Infarct Angina</b>	Persistent coronary stenosis Multivessel disease	Anytime	Aggressive medical therapy PCI or CABG
<b>Recurrent MI</b>	Reocclusion	Anytime	Aggressive medical therapy PCI or CABG
<b>Thromboembolism</b>	Mural/apical thrombus DVT	7-10 d, up to 6 mo	Anticoagulation

## Treatment Algorithm for Chest Pain

**Figure 35. Treatment algorithm for chest pain**

Adapted from: Andreoli and Carpenter. Cecil Essentials of Medicine, 6th ed. Elsevier, 2004. p101. With permission from Elsevier

## Sudden Cardiac Arrest

### Definition

- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; VFib is most common cause

### Etiology

- primary cardiac pathology
  - ischemia/MI
  - LV dysfunction
  - severe ventricular hypertrophy
    - ♦ HCM
    - ♦ AS
  - long QT syndrome
  - congenital heart disease
  - mutations in cardiac ion channels

### Management

- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echo)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone,  $\beta$ -blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see [Anesthesia](#), A28)

## Coronary Revascularization

### PERCUTANEOUS CORONARY INTERVENTION (PCI)

- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

### Indications

- medically refractory angina
- NSTEMI/UA with high risk features (e.g. high TIMI risk score)
- primary/rescue PCI for STEMI

### Balloon Angioplasty and Intracoronary Stenting

- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS)
  - drug-eluting stent (DES)
    - ♦ coated with antiproliferative drugs (sirolimus, paclitaxel)
    - ♦ reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
    - ♦ complication: late stent thrombosis (5 events per 1000 stents implanted)

### Adjunctive Therapies

- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or  $\geq 12$  mo with DES
  - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

### Procedural Complications

- mortality and emergency bypass rates  $< 1\%$
- nonfatal MI: approximately 2-3%

#### Safety and Efficacy of Drug-Eluting and Bare Metal Stents

*Circulation* 2009;119:3198-3206

**Study:** Meta-analysis of RCTs and observational studies. 22 RCTs and 34 observational studies.

**Population:** 9,470 and 182,901 patients in RCTs and observational studies respectively who underwent percutaneous coronary intervention.

**Intervention:** Drug-Eluting Stents (DES) versus Bare Metal Stents (BMS).

**Outcome:** All-cause mortality, myocardial infarction (MI), and target vessel revascularization (TVR).

**Results:** No difference in mortality was found between DES vs. BMS by RCTs, while observational studies showed significantly lower mortality rates in DES-treated patients (hazard ratio (HR) 0.78,  $p < 0.001$ ). No difference in MI incidence was found in RCTs, while lower incidences of MI were found in observational studies (HR 0.87,  $p = 0.014$ ). DES has a significantly lower TVR rate in both RCT (HR 0.45,  $p < 0.001$ ) and observational studies (HR 0.46,  $p < 0.001$ ).

**Conclusions:** DES significantly reduces rates of TVR compared to BMS. Although there is no difference in mortality or MI incidence as found by RCTs, observational studies suggest lowered mortality and MI rates in patients with DES over BMS.

## CORONARY ARTERY BYPASS GRAFT (CABG) SURGERY

- objective of CABG is complete reperfusion of the myocardium

### Indications

- CABG
  - ≥50% diameter stenosis in the left main coronary artery
  - ≥70% diameter stenosis in three major coronary arteries
  - ≥70% diameter stenosis in the proximal LAD artery plus one other major coronary artery
  - survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant (≥70% diameter) stenosis in a major coronary artery
- other:
  - ≥70% diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
  - ≥70% diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
  - multivessel CAD in patients with diabetes
  - LV systolic dysfunction (LVEF 35% to 50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- PCI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG
- CABG or PCI
  - one or more significant (≥70% diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

**Table 8. Choice of Revascularization Procedure**

	PCI	CABG
<b>Advantages</b>	Less invasive technique Decreased periprocedural morbidity and mortality Shorter periprocedural hospitalization	Greater ability to achieve complete revascularization Decreased need for repeated revascularization procedures
<b>Indications</b>	Single or double-vessel disease Inability to tolerate surgery	Triple-vessel or left main disease DM Plaque morphology unfavourable for PCI

**Table 9. Conduits for CABG**

Graft	Occlusion/Patency Rate	Considerations
<b>Saphenous Vein Grafts (SVG)</b>	At 10 yr, 50% occluded, 25% stenotic, 25% angiographically normal	Used when arterial grafts are not available or many grafts are required, such as triple or quadruple bypass
<b>Left Internal Thoracic/Mammary Artery (LITA/LIMA) (LIMA to LAD)</b>	90-95% patency at 15 yr	Most preferred option because of excellent patency Improved event-free survival (angina, MI) Decreased late cardiac events No increase in operative risk
<b>Right Internal Thoracic/Mammary Artery (RITA/RIMA)</b>	Pedicled RIMA patency comparable to LIMA Free RIMA patency less	Used in bilateral ITA/IMA grafting Patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty
<b>Radial Artery (free graft)</b>	85-90% patency at 5 yr	Prone to severe vasospasm postoperatively due to muscular wall
<b>Right Gastroepiploic Artery</b>	80-90% patency at 5 yr	Primarily used as an in situ graft to bypass the RCA Use limited because of the fragile quality of the artery, other technical issues, increased operative time (laparotomy incision) and incisional discomfort with associated ileus
<b>Complete Arterial Revascularization</b>		For younger patients (<60 yr of age) Is preferred due to longer term graft patency
<b>Redo Bypass Grafting</b>		Operative mortality 2-3 times higher than first operation 10% perioperative MI rate Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA and other bypass grafts

### Operative Issues

- left ventricular (LV) function is an important determinant of outcome of all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, PET scanning or MRI

**Percutaneous Coronary Intervention versus Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease. SYNTAX Trial**  
*NEJM* 2009;360:961-972

**Study:** Prospective RCT.

**Population:** 1800 patients with untreated three-vessel or left main coronary artery disease and anatomically equivalent for both Percutaneous Intervention (PCI) and Coronary Artery Bypass Graft (CABG).

**Intervention:** PCI versus CABG.

**Outcome:** Composite of death from any cause, stroke, MI, or repeat revascularization in 12 mo post-intervention.

**Results:** Incidence of primary outcome was lower in the CABG intervention vs. PCI (12.4% vs. 17.8%,  $P=0.002$ , NNT=19). PCI was associated with significantly higher rates of repeat revascularization (13.5% vs. 5.9%,  $P<0.001$ ) and cardiac death (3.7% vs. 2.1%,  $P=0.05$ ), while CABG had higher rates of stroke (2.2% vs. 0.6%,  $P=0.03$ ).

**Conclusions:** In patients with three-vessel or left main coronary artery disease CABG is superior to PCI in preventing major adverse cardiovascular and cerebrovascular events within 12 mo of intervention.

**Effect of Perioperative Glucose-insulin-potassium Infusions on Mortality and Atrial Fibrillation After Coronary Artery Bypass Grafting: a Systematic Review and Meta-analysis**

*Can J Cardiol* 2010;26:178-184

Perioperative use of glucose-insulin-potassium or glucose-insulin infusions does not significantly reduce mortality or atrial fibrillation in patients undergoing CABG surgery. Unless future trial data in support of GIK/GI infusions become available, the routine use of these treatments in patients undergoing CABG surgery should be discouraged because the safety of these infusions has not been systematically examined.

**Table 10. Risk Factors for CABG Mortality and Morbidity (decreasing order of significance)**

Risk Factors for CABG Mortality	Risk Factors for CABG Postop Morbidity or Increased Length of Stay
Urgency of surgery (emergent or urgent)	Reoperation
Reoperation	Emergent procedure
Older age	Preoperative intra-aortic balloon pump (IABP)
Poor left ventricular function (see below)	Congestive heart failure
Female gender	CABG + valve surgery
Left main disease	Older age
Others include catastrophic conditions (cardiogenic shock, ventricular septal rupture, ongoing CPR), dialysis-dependent renal failure, end-stage COPD, diabetes, cerebrovascular disease, and peripheral vascular disease	Renal dysfunction
	COPD
	DM
	Cerebrovascular disease

**Procedural Complications**

- CABG using cardiopulmonary bypass (CPB)
  - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - immunosuppression
  - systemic inflammatory response leading to:
    - myocardial dysfunction
    - renal dysfunction
    - neurological injury
    - respiratory dysfunction
    - coagulopathies

**OFF-PUMP CORONARY ARTERY BYPASS (OPCAB) SURGERY****Procedure**

- OPCAB avoids the use of CPB by allowing surgeons to operate on a beating heart
  - stabilization devices (e.g. Genzyme Immobilizer®) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - procedure is safe and well tolerated by most patients; however, OPCAB surgery remains technically more demanding

**Indications**

- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- absolute contraindications:** hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels and calcified coronary vessels
- relative contraindications:** cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

**Outcomes**

- OPCAB decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
- no significant difference in terms of survival at 2 yr, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG) or medication usage compared to on-pump CABG

## Heart Failure

### Congestive Heart Failure (CHF)

**Definitions**

- heart failure: a complex clinical syndrome, resulting from almost any cardiac disorder that impairs the ability of the ventricle to fill with or eject blood
- forward heart failure: heart unable to maintain adequate cardiac output to meet demand or is able to do so only by elevating filling pressure
- backward heart failure: heart unable to accommodate venous return resulting in elevated filling pressures and vascular congestion (systemic or pulmonary)
- heart failure can involve left side of heart (left heart failure), right side (right heart failure) or both (biventricular failure) (see Table 11)
- heart failure can also have components of ineffective ventricular filling (diastolic dysfunction) and/or contraction (systolic dysfunction)
- most cases associated with poor cardiac output (low-output heart failure); however, some cases of CHF not due to intrinsic cardiac disease but instead due to increased demand (high-output heart failure)

**Table 11. Signs and Symptoms of Left vs. Right Heart Failure**

	Left Failure	Right Failure
<b>Low cardiac output (forward)</b>	Fatigue Syncope Systemic hypotension Cool extremities Slow capillary refill Peripheral cyanosis Pulsus alternans Mitral regurgitation S3	Left failure symptoms if decreased RV output leads to LV underfilling Tricuspid regurgitation S3 (right-sided)
<b>Venous congestion (backward)</b>	Dyspnea, orthopnea, PND Cough Crackles	Peripheral edema Elevated JVP with abdominal jugular reflex and Kussmaul's sign Hepatomegaly Pulsatile liver

**Pathophysiology**

- primary insults (myocyte loss, overload) → pump dysfunction, which leads to:
  - remodeling (dilatation, hypertrophy)
  - neurohumoral activation → necrosis and apoptosis
- both pathways result in further damage (re-starting the cycle), edema, tachycardia, vasoconstriction, congestion
- compensatory response to myocardial stress (perpetuate disease process)
  - increased end-systolic ventricular pressure (pressure overload)
    - e.g. HTN, aortic stenosis → hypertrophy
  - increased end-diastolic ventricular volume (volume overload)
    - e.g. aortic regurgitation → cardiac dilatation
- systemic response to ineffective circulating volume
  - activation of sympathetic nervous and renin-angiotensin-aldosterone systems results in:
    - salt and water retention with intravascular expansion
    - increased heart rate and myocardial contractility
    - increased afterload

**Systolic Dysfunction**

- impaired myocardial contractile function → decreased LVEF and SV → decreased CO
- findings: apex beat displaced, S3, increased heart size on CXR, decreased LVEF, LV dilatation
- causes:
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - alcohol (and other toxins)
    - myocarditis
    - dilated cardiomyopathy (multiple causes – see *Dilated Cardiomyopathy*, C36)

**Heart Failure with Preserved Ejection Fraction (HFPEF)**

- previously known as “diastolic dysfunction”
- up to 1/2 of all HF patients have normal systolic function (i.e. normal ejection fraction) and the cause of heart failure is impaired diastolic filling; prevalence higher in older patients
- increased LV filling pressures produce venous congestion upstream (i.e. pulmonary and systemic venous congestion)
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal LVEF
- causes of decreased compliance:
  - transient: ischemia (relaxation of myocardium is active and requires ATP)
  - permanent
    - severe hypertrophy (HTN, aortic stenosis, HCM)
    - restrictive cardiomyopathy (e.g. amyloid)
    - MI

**High-Output Heart Failure**

- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget's disease, renal disease, hepatic disease

**Dichotomies of Heart Failure**

- Forward vs. Backward
- Left-sided vs. Right-sided
- Systolic vs. Diastolic dysfunction
- Low output vs. High output

**Use Ejection Fraction to Grade LV Dysfunction**

- Grade I (EF > 60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤ 20%)

**A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score**  
*Am Heart J* 2006;151:48-54

Predictor	Possible Score
Age >75 yr	1
Orthopnea present	2
Lack of cough	1
Current loop diuretic use (before presentation)	1
Rales on lung exam	1
Lack of fever	2
Elevated NT-proBNP (>450 pg/mL if <50 yr, >900 pg/mL if >50 yr)	4
Interstitial edema on chest x-ray	2
Total	/14

Likelihood of heart failure:  
 Low = 0-5  
 Intermediate = 6-8  
 High = 9-14

Brain natriuretic peptide (BNP) is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Baggish et al. is commonly used. A score of <6 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 96% and specificity of 84% (P<0.001) for the diagnosis of acute heart failure.

**New York Heart Association (NYHA) Functional Classification of Heart Failure**

- Class I:** ordinary physical activity does not cause symptoms of HF
- Class II:** comfortable at rest, ordinary physical activity results in symptoms
- Class III:** marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- Class IV:** inability to carry out any physical activity without discomfort; symptoms may be present at rest

## Etiologies of Primary Insults

- consider predisposing, precipitating and perpetuating factors

## Precipitants of Symptomatic Exacerbations

- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection, etc.
  - failure to take medications as prescribed

## Investigations

- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH,  $\pm$  ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchiolar-alveolar cuffing
- echo: LVEF, cardiac dimensions, wall motion abnormalities, valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

## Acute Treatment of Pulmonary Edema

- treat acute precipitating factors (e.g. ischemia, arrhythmias)
- L** – Lasix® (furosemide) 40-500 mg IV
- M** – morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
- N** – nitroglycerin: topical/IV/SL
- O** – oxygen: in hypoxemic patients
- P** – positive airway pressure (CPAP/BiPAP): decreases preload and need for ventilation when appropriate
- P** – position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP, other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency  $\beta$ 1 agonist)
      - high dose: increases SVR (low potency  $\beta$ 1 agonist), which is undesirable
    - dobutamine
      - selective inotrope ( $\beta$ 1 agonist) and arterial vasodilator ( $\beta$ 1 antagonist)
    - phosphodiesterase inhibitors (milrinone)
      - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP) if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - intra-aortic balloon pump (IABP)
  - left or right ventricular assist device (LVAD/RVAD)
  - cardiac transplant

## Long Term Management

- note that most evidence-based management applies to HFREF
- priorities in HFPEF focus on controlling systolic and diastolic hypertension, as a risk factor control measure

## Conservative Measures

- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
- multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

### Five Most Common Causes of CHF

- CAD (60-70%)
- HTN
- Idiopathic (often dilated cardiomyopathy)
- Valvular (e.g. AS, AR and MR)
- Alcohol (dilated cardiomyopathy)

### Precipitants of Heart Failure

#### HEART FAILED

- Hypertension (common)
- Endocarditis/environment (e.g. heat wave)
- Anemia
- Rheumatic heart disease and other valvular disease
- Thyrotoxicosis
- Failure to take meds (very common)
- Arrhythmia (common)
- Infection/Ischemia/Infarction (common)
- Lung problems (PE, pneumonia, COPD)
- Endocrine (pheochromocytoma, hyperaldosteronism)
- Dietary indiscretions (common)

Various clinical guidelines, including the Acute Heart Failure Syndromes AHA 2010 Guidelines, and the 2012 Canadian Cardiovascular Society (CCS) Heart Failure Management Guidelines, indicate the current approach of acute heart failure exacerbation may be too homogenous. The CCS guidelines in particular offer several suggestions, including cautious use of oxygen in normoxic patients due to the possible risk of causing increased systemic resistance and reduced cardiac output, reserving the use of non-invasive ventilation for patients not responding to medical therapy, as well as preference for high dose rather than low dose diuretic therapy.

The most common cause of right heart failure is left heart failure.

### Measuring NT-pro BNP

BNP is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP portion.

NT-proBNP levels (pg/mL)	
Age	HF very likely
<50	>450
50-75	>900
>75	>1800

Limitations: Age, body habitus, renal function, pulmonary embolism

## Pharmacological Therapy

### 1. Vasodilators

- ACEI: standard of care – slows progression of LV dysfunction and improves survival
  - all symptomatic patients functional class II-IV
  - all asymptomatic patients with LVEF <40%
  - post-MI
- angiotensin II receptor blockers (ARBs)
  - second-line to ACEI if not tolerated, or as adjunct to ACEI if  $\beta$ -blockers not tolerated – hydralazine and nitrates
  - second-line to ACEI, decrease in mortality not as great as with ACEI
  - may consider in acute renal failure until creatinine stabilizes

### 2. $\beta$ -blockers: slow progression and improve survival

- class I-III with LVEF <40%
- stable class IV patients
- note: should be used cautiously, titrate slowly because may initially worsen CHF**

### 3. Diuretics: symptom control, management of fluid overload

- furosemide (40-500 mg daily) for potent diuresis
- metolazone may be used with furosemide to increase diuresis
- furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by  $\beta$ -blockers, ACEI, ARBs, and aldosterone antagonists

### 4. Aldosterone antagonists: mortality benefit in severe CHF

- spironolactone for class IIb and IV CHF already on ACEI and loop diuretic
- eplerenone may be considered if intolerable endocrine side effects
- note: potential for life threatening hyperkalemia
  - monitor  $K^+$  after initiation and avoid if  $Cr > 220 \mu\text{mol/L}$  or  $K^+ > 5.2 \text{ mmol/L}$

### 5. Inotropes: digoxin improves symptoms and decreases hospitalizations, no effect on mortality

- indications: patient in sinus rhythm and symptomatic on ACEI, or CHF and AFib
- patients on digitalis glycosides may worsen if these are withdrawn

### 6. Antiarrhythmic drugs: for use in CHF with arrhythmia

- can use amiodarone,  $\beta$ -blocker, or digoxin

### 7. Anticoagulants: warfarin for prevention of thromboembolic events

- prior thromboembolic event or AFib, presence of LV thrombus on echo
- possible benefit in other patients with LVEF <30% (controversial)

## Procedural Interventions

- resynchronization therapy: symptomatic improvement with biventricular pacemaker
  - consider if QRS >130 msec, LVEF <35%, and severe symptoms despite optimal therapy
  - greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS >150 msec, high diuretic requirement
- ICD: mortality benefit in 1° prevention of sudden cardiac death
  - prior MI, optimal medical therapy, LVEF <30%, clinically stable
  - prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see *Ventricular Assist Devices*, C34)
- cardiac transplantation (see *Cardiac Transplantation*, C34)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see *Valvular Heart Disease*, C38)

### Features of Heart Failure on CXR

#### HERB-B

- Heart enlargement (cardiothoracic ratio >0.50)
- Pleural Effusion
- Re-distribution (alveolar edema)
- Kerley B lines
- Bronchiolar-alveolar cuffing

Patients on  $\beta$ -blocker therapy who have acute decompensated heart failure should continue  $\beta$ -blockers where possible (provided they are not in cardiogenic shock or in severe pulmonary edema).

### Can the Clinical Examination Diagnose Left-Sided Heart Failure in Adults?

#### From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3478992>

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of congestive heart failure.

**Results:** The diagnosis of left ventricular dysfunction in patient after an MI based on the presence of radiographic pulmonary venous congestion with edema, rales one-third up the lung fields in the absence of a chronic pulmonary disease, or a 3rd heart sound had a positive likelihood ratio (+LR) of 3.1 (95% CI, 1.7-5.8) and a negative likelihood ratio (-LR) of 0.62 (95% CI, 0.46-0.83). In inpatients the combination of clinical findings, ECG and CXR had a +LR of 2.0 (95% CI, 1.6-2.5) and a -LR of 0.41 (95% CI, 0.30-0.56). Female sex [+LR, 1.6 (95% CI, 1.2-2.2)] and sBP  $\geq 160 \text{ mmHg}$  [+LR, 1.8 (95% CI, 1.3-2.6)] were most indicative for diastolic dysfunction. Heart rate  $\geq 100/\text{min}$  [+LR 0.43 (95% CI, 0.28-0.65)] and left atrial ECG abnormality [+LR 0.42 (95% CI, 0.26-0.63)] were most indicative for systolic dysfunction.

**Conclusions:** Patients with signs, symptoms and risk factors for systolic dysfunction should receive an ECG and CXR. Female sex and sBP  $\geq 160 \text{ mmHg}$  are suggestive of diastolic dysfunction; heart rate  $\geq 100/\text{min}$  and left atrial ECG abnormality suggest systolic dysfunction.

### Chronic Treatment of CHF

- ACE inhibitors\*
- $\beta$ -blockers\*
- $\pm$  Aldosterone antagonists\* (if severe CHF)
- Diuretic
- $\pm$  Inotrope
- $\pm$  Antiarrhythmic
- $\pm$  Anticoagulant

\*Mortality benefit

Figure 36. Effect of heart failure treatment on the Frank-Starling curve

## Sleep-Disordered Breathing

- 45-55% of patients with CHF have sleep disturbances, including Cheyne-Stokes breathing and sleep apnea (central or obstructive)
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating Cheyne-Stokes respiration/sleep apnea with improvement in cardiac function and symptoms

## Cardiac Transplantation

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1-yr survival is 85-90%, 5-yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

### Indications for Surgery

- severe cardiac disability despite maximal medical therapy (recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption  $<14$  mL/kg/min in absence of  $\beta$ -blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (unstable angina not amenable to CABG or angioplasty with LVEF  $<30\%$ ; recurrent, symptomatic ventricular arrhythmias)
- exclusion of all surgical alternatives to cardiac transplantation

### Prerequisites

- emotionally stable with social support
- medically compliant and motivated
- relative contraindications: incurable malignancy, major systemic illness, irreversible major organ disease (e.g. renal, hepatic), active systemic infection (e.g. Hep C, HIV), obesity, irreversible pulmonary HTN (pulmonary vascular resistance [PVR]  $>6$  Wood units), severe COPD ( $FEV_1 <1$  L) or active drug addiction or alcoholism
- typically age  $<70$  yr

### Complications

- rejection
  - common, less than 5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
    - ♦ no noninvasive tests to detect rejection
  - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft CAD
  - approximately 50% develop graft CAD within 5 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
  - cutaneous neoplasms most common, followed by non-Hodgkin's lymphoma and lung cancer
- immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

## Ventricular Assist Devices (VADs)

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD)
- indications
  - bridge to transplantation
  - postoperative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
    - ♦ IABP is a catheter based device inserted into the aorta via the femoral artery that decreases myocardial  $O_2$  demand and increases blood flow to coronary arteries
  - postoperative cardiogenic shock

### Influence of Ejection Fraction on Cardiovascular Outcomes in a Broad Spectrum of Heart Failure Patients

*Circulation* 2005;112:3738-3744

**Purpose:** Understand the relationship between ejection fractions and cardiovascular risk in patients with heart failure.

**Methods:** 7599 patients from the CHARM study (Candesartan in Heart failure: Assessment of Reduction in Mortality and morbidity; RCT comparing placebo vs. candesartan in patients with NYHA class II to IV). Compared LVEF to cardiovascular outcomes and causes of death.

**Results:** All-cause mortality increased by 39% per 10% reduction in LVEF below 45% (Hazard ratio 1.39, 95%CI 1.32-1.46). For LVEF  $>45\%$ , ejection fraction does not further contribute to assessment of cardiovascular risk in HF patients.

**Conclusions:** At LVEF  $<45\%$ , lower ejection fractions were associated with poorer cardiovascular outcomes.

LVEF	CHF Hospitalization	All-Cause Mortality
$\leq 22\%$	14.9%	15.4%
23-32%	10.9%	10.8%
33-42%	7.2%	7.4%
43-52%	5.7%	5.2%
$>52\%$	6.9%	5.7%

### Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function

*Am Heart J* 2006;151:444-450

**Purpose:** To establish the association between NYHA class and outcomes with heart failure and preserved systolic function

**Methods:** Retrospective follow-up study (median 38.5 mo) of 988 patients with heart failure with ejection fraction  $>45\%$ . Estimated risks of various outcomes using Cox proportional hazard models.

**Results:** Adjusted hazard ratio for all-cause mortality for NYHA class I, II, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted hazard ratio for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.

**Conclusions:** Higher NYHA classes were associated with poorer outcomes in patients with heart failure and preserved systolic function.

Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.

NYHA	Proportion of All-Cause Hospitalization	Proportion of All-Cause Mortality
I	60.7%	14.3%
II	65.2%	21.3%
III	77.7%	35.9%
IV	75.0%	58.3%

### Effects of Donor Pre-treatment with Dopamine on Survival After Heart Transplantation: a Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicenter Trial

*J Am Coll Cardiol* 2010;58:1768-1777

Treatment of brain-dead donors with dopamine of 4  $\mu$ g/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

## Myocardial Disease

### Definition of Cardiomyopathy

- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2° to MI often termed “ischemic cardiomyopathy”, is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

**Table 12. Summary Table for CHF and Myocardial Disease**

SYSTOLIC HEART FAILURE		DIASTOLIC HEART FAILURE		
Dilated Cardiomyopathy	Secondary Causes	Hypertrophic Cardiomyopathy	Restrictive Cardiomyopathy	Secondary Causes
Idiopathic, infectious (e.g. myocarditis), alcohol, familial, collagen vascular disease, etc.	CAD, MI, DM, valvular (e.g. AR, MR)	Genetic disorder affecting cardiac sarcomeres (most common cause of sudden cardiac death in young athletes)	Amyloidosis, sarcoidosis, scleroderma, hemochromatosis, Fabry's, Pompe's Disease, Loeffler's, etc.	HTN, DM, valvular (e.g. AS), post-MI, transiently by ischemia, etc.

Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness Following Left Ventricular Assist Device Implantation

*Can J Cardiol* 2012;28:137-140

Patients with a continuous flow, NYHA class I-III, LVAD that are stable 2 mo post LVAD implantation qualify for private driving only and are disqualified from commercial driving.

#### REMATCH Trial

*NEJM* 2001;345:1435-1443

Increased survival of 23% vs. 8% with LVAD vs. medical management of heart failure after 2 yr. Heartmate VAD has a biologic surface therefore does not require long-term anticoagulation but higher risk of infection.

#### Cardiomyopathy

##### HARD

Hypertrophic cardiomyopathy  
Arrhythmogenic right ventricular cardiomyopathy  
Restrictive cardiomyopathy  
Dilated cardiomyopathy

## Myocarditis

### Definition

- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

### Etiology

- idiopathic
- infectious
  - viral (most common): coxsackie B, echovirus, poliovirus, HIV, mumps
  - bacterial: *S. aureus*, *C. perfringens*, *C. diphtheriae*, *Mycoplasma*, *Rickettsia*
  - fungi
  - spirochetal (Lyme disease – *Borrelia burgdorferi*)
  - Chagas disease (*Trypanosoma cruzi*), toxoplasmosis
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (SLE, RA, others), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

### Signs and Symptoms

- constitutional symptoms
- acute CHF
- chest pain – due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- sudden death

### Investigations

- ECG: non-specific ST-T changes ± conduction defects
- bloodwork
  - increased CK, troponin, LDH, and AST with acute myocardial necrosis ± increased WBC, ESR, ANA, rheumatoid factor, complement levels
  - blood culture, viral titres and cold agglutinins for *Mycoplasma*
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- myocardial biopsy

### Management

- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible

### Prognosis

- usually self-limited and often unrecognized, many recover
- sudden death in young adults
- may progress to dilated cardiomyopathy

## Dilated Cardiomyopathy (DCM)

### Definition

- unexplained dilation and impaired systolic function of one or both ventricles

### Etiology

- idiopathic (presumed viral or idiopathic) ~50% of DCM
- alcohol
- familial/genetic
- uncontrolled tachycardia (e.g. persistent rapid AFib)
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), antiretrovirals, chloroquine, clozapine, TCA
- radiation

### Signs and Symptoms

- may present as:
  - CHF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

### Investigations

- bloodwork: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, TIBC
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (non-sustained VT)
- CXR: global cardiomegaly (globular heart), signs of CHF, pleural effusion
- echo: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in selected patients to exclude ischemic heart disease

### Management

- treat underlying disease: e.g. abstinence from alcohol
- treat CHF: see *Heart Failure*, C30
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
  - LVEF <30% (controversial)
- treat symptomatic or serious arrhythmias
- immunize against influenza and *S. pneumoniae*
- consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
- consider ICD among patients with a LVEF <30%

### Prognosis

- depends on etiology
- better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
- cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in 1st yr, 10% per year after

**Major Risks Factors for DCM**  
Alcohol, cocaine, family history

**Abnormal Labs in DCM**

- High BNP
- High Cr
- High LFTs
- Low bicarbonate
- Low Na<sup>+</sup>

## Hypertrophic Cardiomyopathy (HCM)

- see 2011 ACCF/AHA Guideline for the Diagnosis and Treatment of Hypertrophic Cardiomyopathy for details

### Definition

- defined as unexplained ventricular hypertrophy
- various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

### Etiology and Pathophysiology

- histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- prevalence of 1/500-1/1000 in general population
- generally presents in early adulthood

**Hemodynamic Classification**

- hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
- non-obstructive HCM: no LVOT obstruction
- many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

**Signs and Symptoms**

- clinical manifestations: asymptomatic (common, therefore screening is important), SOB on exertion, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, “spike and dome” pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, ‘triple ripple’ (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

**Investigations**

- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR; LVOT gradient can be estimated by Doppler measurement
- genetic cardiac resonance magnetic resonance imaging indicated when echocardiography is inconclusive for diagnosis
- cardiac catheterization (only when patient being considered for invasive therapy)

**Management**

- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of all competitive sports
- treatment of obstructive HCM
  - medical agents:  $\beta$ -blockers, verapamil, phenylephrine, disopyramide
  - avoid nitrates, diuretics and ACEI as they increase LVOT gradient and worsen symptoms
- patients with drug-refractory symptoms
  - surgical myectomy
  - ICD placement
  - septal ethanol ablation
  - dual chamber pacing (rarely done)
- treatment of ventricular arrhythmias: amiodarone or ICD
- first-degree relatives of patients with HCM should be screened annually during adolescence (physical, ECG, 2D echo), then serially every 5 yr during adulthood
- first-degree genetic testing and family screening
- screening for sudden cardiac death: VF, VT, family history, unexplained syncope, maximal LV wall thickness  $\geq 30$  mm

**Prognosis**

- potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
  - major risk factors for sudden death (consider ICD placement)
  - history of survived cardiac arrest/sustained VT
  - family history of multiple premature sudden deaths
  - other factors associated with increased risk of sudden cardiac death
    - ♦ syncope (presumed to be arrhythmic in origin)
    - ♦ non-sustained VT on ambulatory monitoring
    - ♦ marked ventricular hypertrophy (maximum wall thickness  $\geq 30$  mm)
    - ♦ abnormal BP in response to exercise (in patients  $< 40$  yr old with HCM)

## Restrictive Cardiomyopathy (RCM)

**Definition**

- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

**Etiology**

- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis, Loeffler's endocarditis or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

**RCM vs. Constrictive Pericarditis (CP)**  
Present similarly but CP is treatable with surgery.

### Clinical Manifestations

- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

### Investigations

- ECG: low voltage, non-specific, diffuse ST-T wave changes  $\pm$  non-ischemic Q waves
- CXR: mild cardiac enlargement
- echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

### Management

- exclude constrictive pericarditis
- treat underlying disease: control HR, anticoagulate if AFib
- supportive care and treatment for CHF, arrhythmias
- heart transplant: might be considered for CHF refractory to medical therapy

### Prognosis

- depends on etiology

#### Key Investigations

- Echo: may show respiratory variation in blood flow in CP
- CT: may show very thickened pericardium and calcification in CP
- MRI: best modality to directly visualize pericardium and myocardium

## Valvular Heart Disease

- see *Guidelines on the Management of Valvular Heart Disease. Eur Heart J 2012;33(19):2451-2496* for details

### Infective Endocarditis (IE)

- see [Infectious Diseases](#), ID17
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with:
    - ♦ prosthetic valve material
    - ♦ past history of IE
    - ♦ certain types of congenital heart disease
    - ♦ cardiac transplant recipients who develop valvulopathy
  - only for the following procedures:
    - ♦ dental
    - ♦ respiratory tract
    - ♦ procedures on infected skin/skin structures/MSK structures
    - ♦ not GI/GU procedures specifically

### Rheumatic Fever

- see [Pediatrics](#), P61

### Prognosis

- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE  $\pm$  thromboembolism
- onset of symptoms usually after 10-20-yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

#### A Bedside Clinical Prediction Rule for Detecting Moderate or Severe Aortic Stenosis

*J Gen Intern Med 1998;13:699-704*

**Study Design:** Blinded cross sectional study with 124 patients of an ambulatory cardiology clinic. Patients were examined for: 1) murmur over the right clavicle 2) murmur loudest at second right intercostal space 3) reduced intensity of S2 4) reduced volume of the carotid pulse 5) delayed carotid upstroke.

**Methods:** Patients were examined by blinded investigators and the clinical examination findings were compared to findings on subsequent echocardiography. Moderate to severe aortic stenosis was defined as a valve area  $<1.2$  cm<sup>2</sup> or a peak intensity gradient of  $>25$  mmHg.

**Results:** Absence of a murmur over the right clavicle ruled out aortic stenosis while presence of  $\geq 3$  of the 4 associated symptoms ruled in aortic stenosis (LR=40).

**Conclusions:** Bedside techniques can accurately rule in and rule out moderate to severe aortic stenosis.

### Choice of Valve Prosthesis

**Table 13. Mechanical Valve vs. Bioprosthetic Valve**

Mechanical Valve	Bioprosthetic Valve
Good durability	Limited long-term durability (mitral<aortic)
Less preferred in small aortic root sizes	Good flow in small aortic root sizes
Increased risk of thromboembolism (1-3%/yr); requires long-term anticoagulation with coumadin	Decreased risk of thromboembolism: long-term anticoagulation not needed for aortic valves
Target INR Aortic valves: 2.0-3.0 (mean 2.5) Mitral valves: 2.5-3.5 (mean 3.0)	Some recommendation for limited anticoagulation for mitral valves
Increased risk of hemorrhage: 1-2%/yr	Decreased risk of hemorrhage

## Summary of Valvular Disease

Table 14. Valvular Heart Disease

### Aortic Stenosis (AS)

#### Etiology

Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease

#### Definition

Normal aortic valve area = 3–4 cm<sup>2</sup>

Mild AS 1.5 to 3 cm<sup>2</sup>

Moderate AS 1.0 to 1.5 cm<sup>2</sup>

Severe AS <1.0 cm<sup>2</sup>

Critical AS <0.5 cm<sup>2</sup>

#### Pathophysiology

Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF, subendocardial ischemia

#### Symptoms

Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema

#### Physical Exam

Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI  
Auscultation: crescendo-decrescendo SEM radiating to R clavicle and carotid, musical quality at apex (Gallavardin phenomenon), S<sub>4</sub>, soft S<sub>2</sub> with paradoxical splitting, S<sub>3</sub> (late)

#### Investigations

ECG: LVH and strain, LBBB, LAE, AFib

CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF

Echo: reduced valve area, pressure gradient, LVH, reduced LV function

#### Treatment

Asymptomatic: serial echos, avoid exertion

Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS

Surgery if: symptomatic or LV dysfunction

#### Surgical Options

Valve replacement: aortic rheumatic valve disease and trileaflet valve

– prior to pregnancy (if AS significant)

– balloon valvuloplasty (in very young)

#### Interventional Options

Percutaneous valve replacement (transfemoral or transapical approach)

is an option in selected patients who are not considered good candidates for surgery

© Anas Nader 2011

### Aortic Regurgitation (AR)

#### Etiology

Supravalvular: aortic root disease (Marfan's, atherosclerosis and dissecting aneurysm, connective tissue disease)

Valvular: congenital (bicuspid aortic valve, large VSD), IE

Acute Onset: IE, aortic dissection, trauma, failed prosthetic valve

#### Pathophysiology

Volume overload → LV dilatation → increased SV, high sBP and low dBP → increased wall tension → pressure overload → LVH (low dBP → decreased coronary perfusion)

#### Symptoms

Usually only becomes symptomatic late in disease when LV failure develops

Dyspnea, orthopnea, PND, syncope, angina

#### Physical Exam

Waterhammer pulse, bisferiens pulse, femoral-brachial sBP >20 (Hill's test wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex

Auscultation: early decrescendo diastolic murmur at LLSB (cusp pathology) or RLSB (aortic root pathology), best heard sitting, leaning forward, on full expiration, soft S<sub>1</sub>, absent S<sub>2</sub>, S<sub>3</sub> (late)

#### Investigations

ECG: LVH, LAE

CXR: LVH, LAE, aortic root dilatation

Echo/TTE: quantify AR, leaflet or aortic root anomalies

Cath: if >40 yr and surgical candidate – to assess for ischemic heart disease

Exercise testing: hypotension with exercise

#### Treatment

Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)

Symptomatic: avoid exertion, treat CHF

Surgery if: NYHA class III–IV CHF; LV dilatation and/or LVEF <50% with/without symptoms

#### Surgical Options

Valve replacement: most patients

Valve repair: very limited role

Aortic root replacement (Bentall procedure):

– when ascending aortic aneurysm present, valved conduit used

© Anas Nader 2011

### Mitral Stenosis (MS)

#### Etiology

Rheumatic disease most common cause, congenital (rare)

#### Definition

Severe MS is mitral valve area (MVA)

<1.2 cm<sup>2</sup>

#### Pathophysiology

MS → fixed CO and LAE → increased LA pressure → pulmonary vascular resistance and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)

#### Symptoms

SOB on exertion, orthopnea, fatigue, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)

#### Physical Exam

AFib, no "a" wave on JVP; left parasternal lift, palpable diastolic thrill at apex

Auscultation: mid-diastolic rumble at apex, best heard with bell in left lateral decubitus position following exertion, loud S<sub>1</sub>, OS following loud P<sub>2</sub> (heard best during expiration), long diastolic murmur and short A2–OS interval correlate with worse MS

#### Investigations

ECG: NSR/AFib, LAE (P mitrale), RVH, RAD

CXR: LAE, CHF, mitral valve calcification

Echo/TTE: shows restricted opening of mitral valve

Cath: indicated in concurrent CAD if >40 yr (male) or >50 yr (female)

#### Treatment

Avoid exertion, fever (increased LA pressure), treat AFib and CHF, increase diastolic filling time (β-blockers, digitalis)

Surgery if: NYHA class III–IV CHF and failure of medical therapy

#### Invasive Options

Percutaneous balloon valvuloplasty: young rheumatic pts and good leaflet morphology (can be determined by echo), asymptomatic pts with moderate-severe MS, pulmonary HTN

Contraindication: left atrial thrombus, moderate MR

Open Mitral Commissurotomy: if mild calcification + leaflet/chordal thickening

– restenosis in 50% pts in 8 yr

Valve replacement: indicated in moderate-severe calcification and severely scarred leaflets

© Anas Nader 2011

### Mitral Regurgitation (MR)

#### Etiology

Mitral valve prolapse, congenital cleft leaflets, LV dilatation/aneurysm (CHF, DCM, myocarditis), IE abscess, Marfan's syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease

Pathophysiology  
Reduced CO → increased LV and LA pressure → LV and LA dilatation → CHF and pulmonary HTN

Symptoms  
Dyspnea, PND, orthopnea, palpitations, peripheral edema

#### Physical Exam

Displaced hyperdynamic apex, left parasternal lift, apical thrill

Auscultation: holosystolic murmur at apex, radiating to axilla ± mid-diastolic rumble, loud S<sub>2</sub> (if pulmonary HTN), S<sub>3</sub>

#### Investigations

ECG: LAE, left atrial delay (bifid P waves), ± LVH

CXR: LVH, LAE, pulmonary venous HTN

Echo: etiology and severity of MR, LV function, leaflets

Swan-Ganz Catheter: prominent LA "v" wave

#### Treatment

Asymptomatic: serial echos

Symptomatic: decrease preload (diuretics), decrease afterload (ACEI) for severe MR and poor surgical candidates; stabilize acute MR with vasodilators before surgery

Surgery if: acute MR with CHF, papillary muscle rupture, NYHA class III–IV CHF, AF, increasing LV size or worsening LV function, earlier surgery if valve repairable (>90% likelihood) and patient is low-risk for surgery

#### Surgical Options

Valve repair: >75% of pts with MR and myxomatous mitral valve prolapse – annuloplasty rings, leaflet repair, chordae transfers/shorten/replacement

Valve replacement: failure of repair, heavily calcified annulus

Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation

© Anas Nader 2011

**Figure 37. Hemodynamics of aortic stenosis**

Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2.

**Figure 38. Hemodynamics of aortic regurgitation**

Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume.

**Figure 39. Hemodynamics of acute mitral regurgitation**

During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP).

**Figure 40. Hemodynamics of mitral stenosis**

First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible.

# Pericardial Disease

## Acute Pericarditis

### Etiology of Pericarditis/Pericardial Effusion

- idiopathic is most common: presumed to be viral
- infectious
  - viral: Coxsackie virus A, B (most common), echovirus
  - bacterial: *S. pneumoniae*, *S. aureus*
  - TB
  - fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, RA, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (sarcoid)

### Signs and Symptoms

- diagnostic triad: chest pain, friction rub, and ECG changes
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi- or triphasic
- $\pm$  fever, malaise

### Investigations

- ECG: initially diffuse elevated ST segments  $\pm$  depressed PR segment, the elevation in the ST segment is concave upwards  $\rightarrow$  2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- echo: performed to assess for pericardial effusion

### Treatment

- treat the underlying disease
- anti-inflammatory agents (high dose NSAIDs/ASA, steroids if severe or recurrent), analgesics

### Complications

- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

#### Acute Pericarditis Triad

- Chest Pain
- Friction Rub
- ECG Changes

## Pericardial Effusion

### Etiology

- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

### Signs and Symptoms

- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant "x" descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds  $\pm$  rub
- Ewart's sign

### Investigations

- ECG: low voltage, flat T waves, electrical alternans
- CXR: cardiomegaly, rounded cardiac contour
- echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement

### Treatment

- mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
- severe: treat as in tamponade (see *Cardiac Tamponade*, C43)

#### Ewart's Sign

Bronchial breathing and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung.

## Cardiac Tamponade

### Etiology

- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

### Pathophysiology

- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

### Signs and Symptoms

- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in systolic BP >10 mmHg during quiet breathing)
- JVP “x” descent only, blunted “y” descent
- hepatic congestion/peripheral edema

### Investigations

- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
- cardiac catheterization

### Treatment

- pericardiocentesis – echo-guided
- pericardiectomy
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO)
- IV fluid may increase CO
- treat underlying cause

#### Classic Quartet of Tamponade

- Hypotension
- Increased JVP
- Tachycardia
- Pulsus paradoxus

#### Beck's Triad

- Hypotension
- Increased JVP
- Muffled heart sounds

#### DDx Pulsus Paradoxus

- Constrictive pericarditis (rarely)
- Severe obstructive pulmonary disease (e.g. asthma)
- Tension pneumothorax
- PE
- Cardiogenic shock
- Cardiac tamponade

## Constrictive Pericarditis

### Etiology

- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

### Signs and Symptoms

- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
  - ascites, hepatosplenomegaly, edema
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent “y” descent)
- BP usually normal (and usually no pulsus paradoxus)
- precordial examination: ± pericardial knock (early diastolic sound)
- see Table 15 for differentiation from cardiac tamponade

### Investigations

- ECG: non-specific – low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/MRI: pericardial thickening
- cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

### Treatment

- medical: diuretics, salt restriction
- surgical: pericardiectomy (only if refractory to medical therapy)
- prognosis best with idiopathic or infectious cause and worst in post-radiation. Death may result from heart failure

**Table 15. Differentiation of Constrictive Pericarditis vs. Cardiac Tamponade**

Characteristic	Constrictive Pericarditis	Cardiac Tamponade
JVP	“y” > “x”	“x” > “y”
Kussmaul's sign	Present	Absent
Pulsus paradoxus	Uncommon	Always
Pericardial knock	Present	Absent
Hypotension	Variable	Severe

## VASCULAR DISEASE

- see ESC Guidelines on the Diagnosis and Treatment of Peripheral Artery Diseases: Document Covering Atherosclerotic Disease of Extracranial Carotid and Vertebral, Mesenteric, Renal, Upper and Lower Extremity Arteries. "The Task Force on the Diagnosis and Treatment of Peripheral Artery Diseases of the European Society of Cardiology (ESC)." *Eur Heart J* 2011;32(22):2851-2906 for details

## Peripheral Arterial Disease

### Peripheral Vascular Anatomy

- see Figure 41

### Acute Arterial Occlusion/Insufficiency

#### Definition

- acute occlusion/rupture of a peripheral artery
- urgent management required: treat within 6 h or irreversible ischemia and myonecrosis may result
- tends to be lower extremity > upper extremity; femoropopliteal > aortoiliac

#### Etiology and Risk Factors

**Table 16. Clinical Categories of Acute Limb Ischemia**

Grade	Category	Sensory loss	Motor deficit	Prognosis
I	Viable	None	None	No immediate threat
IIA	Marginally threatened	None or minimal (toes)	None	Salvageable if promptly treated
IIB	Immediately threatened	More than toes	Mild/moderate	Salvageable if promptly revascularized
III	Irreversible	Profound, anesthetic	Profound, paralysis (rigor)	Major tissue loss Amputation, Permanent nerve damage inevitable

#### Hypercoagulable States

- congenital
  - group I (reduced anti-coagulants): anti-thrombin, protein C, protein S
  - group II: factor V leiden, prothrombin, factor VIII, hyper-homocysteinemia
- acquired: immobility, cancer, pregnancy/OCB, anti-phospholipid antibody syndrome, inflammatory disorders (e.g. IBD), myeloproliferative disorders (e.g. ET), nephrotic syndrome (acquired deficit in protein C and S), disseminated intravascular coagulation (DIC), heparin-induced thrombocytopenia with thrombosis (HITT)
- for presentation of embolus vs. thrombus see Table 17

#### Investigations

- history and physical exam: depending on degree of ischemia may have to forego investigations and go straight to OR
- ABI: extension of physical exam, easily performed at bedside
- ECG, troponin: rule out recent MI or arrhythmia
- CBC: rule out leukocytosis, thrombocytosis or recent drop in platelets in patients receiving heparin
- PT/INR: patient anticoagulated/sub-therapeutic INR
- echo: identify wall motion abnormalities, intracardiac thrombus, valvular disease, aortic dissection (type A)
- CT angiogram: underlying atherosclerosis, aneurysm, aortic dissection
- conventional catheter based angiography: can be obtained in OR; prelude to thrombolytics

#### Treatment

- immediate heparinization with 5000 IU bolus and continuous infusion to maintain PTT >60 s
- if absent power and sensation: emergent revascularization
- if present power and sensation: work-up (including angiogram)
- definitive treatment
  - embolus: embolectomy
  - thrombus: thrombectomy ± bypass graft ± endovascular therapy
  - irreversible ischemia: primary amputation
- identify and treat underlying cause
- continue heparin post-op, start warfarin post-op day 1 x 3 mo depending on underlying etiology

**Figure 41. Peripheral vascular anatomy**

#### Hypercoagulable State

##### Congenital

- Group I (reduced anticoagulants)
  - Antithrombin
  - Protein C
  - Protein S
- Group II (increased coagulants)
  - Factor V Leiden
  - Prothrombin
  - Factor VIII
  - Hyper-homocysteinemia

##### Acquired

- Immobility
- Cancer
- Pregnancy/OCB
- Antiphospholipid antibody syndrome
- Inflammatory disorders (e.g. IBD)
- Myeloproliferative disorders (e.g. ET)
- Nephrotic syndrome (acquired deficit in Protein C and S)
- Disseminated Intravascular Coagulation (DIC)
- Heparin-Induced Thrombocytopenia

**Table 17. Arterial Embolism vs. Thrombosis**

Presentation	Embolus	Thrombus
Onset	Acute	Progressive, acute-on-chronic
Loss of function/sensation	Prominent	Less profound (due to underlying collaterals)
Hx of claudication	No	Maybe
Atrophic changes	No	Maybe
Contralateral limb pulses	Classically normal	Decreased or absent

**Complications**

- compartment syndrome with prolonged ischemia; requires fasciotomy
- renal failure and multi-organ failure due to toxic metabolites from ischemic muscle

**Prognosis**

- 12-15% mortality rate
- 5-40% morbidity rate (amputation)

**Symptoms of Acute Limb Ischemia**

**6 Ps** – all may not be present

**Pain:** absent in 20% of cases

**Pallor:** within a few hours becomes mottled cyanosis

**Paresthesia:** light touch lost first then sensory modalities

**Paralysis/Power loss:** most important, heralds impending gangrene

**Polar/Poikilothermia** (cold)

**Pulselessness:** not reliable

## Chronic Arterial Occlusion/Insufficiency

**Etiology**

- predominantly due to atherosclerosis: primarily lower extremities

**Risk Factors**

- major: smoking, DM
- minor: HTN, hyperlipidemia, family history, obesity, sedentary lifestyle

**Clinical Features**

- claudication
  1. pain with exertion: usually in calves or any exercising muscle group
  2. relieved by short rest: 2 to 5 min, and no postural changes necessary
  3. reproducible: same distance to elicit pain, same location of pain, same amount of rest to relieve pain
- critical limb ischemia
  1. includes rest pain, night pain, tissue loss (ulceration or gangrene)
  2. ankle pressure <40 mmHg, toe pressure <30 mmHg, ABI <0.40
- pulses may be absent at some locations, bruits may be present
- signs of poor perfusion: hair loss, hypertrophic nails, atrophic muscle, skin ulcerations and infections, slow capillary refill, prolonged pallor with elevation and rubor on dependency, venous troughing (collapse of superficial veins of foot)
- other manifestations of atherosclerosis: CVD, CAD, impotence, splanchnic ischemia

**Investigations**

- non-invasive
  - routine bloodwork, fasting metabolic profile
  - ABI: take highest brachial and highest ankle [dorsalis pedis (DP) or posterior tibial (PT)] pressures for each side generally
    - ♦ ABI <0.90 abnormal, rest pain appears at <0.3 (see Table 18)
  - CTA and MRA: excellent for large arteries (aorta, iliac, femoral, popliteal), may have difficulty with tibial arteries (especially in the presence of disease). Both require IV injection of nephrotoxic contrast (iodinated contrast for CT, gadolinium for MR)
- invasive
  - arteriography: superior resolution to CTA/MRA, better for tibial arteries, can be done intraoperatively

**Differential of Claudication****Vascular**

- Atherosclerotic disease
- Vasculitis (e.g. Buerger's disease, Takayasu's arteritis)
- Diabetic neuropathy
- Venous disease (e.g. DVT, varicose veins)
- Popliteal entrapment syndrome (e.g. Baker's cyst, tumour)

**Neurologic**

- Neurospinal disease (e.g. spinal stenosis)
- Reflex sympathetic dystrophy

**MSK**

- Osteoarthritis
- Rheumatoid arthritis/connective tissue disease
- Remote trauma

**Table 18. Ankle-Brachial Indices**

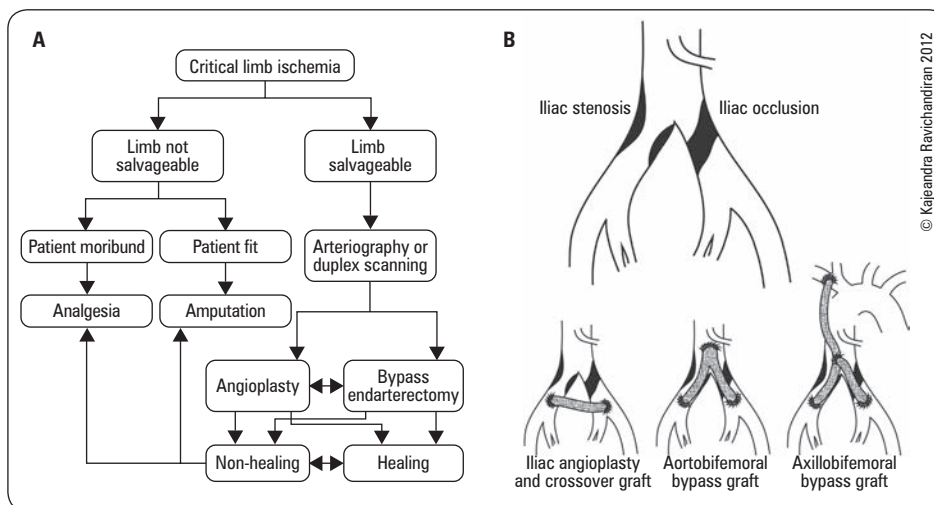

ABI Recording	Degree of Ischemia
>1.2	Suspect wall calcification (most common in diabetics)
>0.95	Normal/no ischemia
0.50 – 0.8	Claudication range
<0.4	Possible critical ischemia

**Treatment** (see Figure 42)

- conservative
  - risk factor modification (smoking cessation, treatment of HTN, hyperlipidemia, DM)
  - exercise program: improves collateral circulation, oxygen extraction at the muscle level
  - foot care (especially in DM): keep wounds clean/dry, avoid trauma and pressure on wounds
- pharmacotherapy
  - antiplatelet agents (ECASA, clopidogrel or more rarely ticlopidine)
  - cilostazol (cAMP-phosphodiesterase inhibitor with antiplatelet and vasodilatory effects) – improves walking distance for some patients with claudication (not available in Canada)
- surgical/endovascular
  - indications: severe lifestyle impairment, vocational impairment, critical ischemia
  - surgical options:
    - ♦ endovascular (stenting/angioplasty) (see [Medical Imaging](#), MI28)
    - ♦ endarterectomy: removal of plaque and repair with patch (usually distal aorta or common/profunda femoral)
    - ♦ bypass graft sites: aortofemoral, axillofemoral, femoropopliteal, distal arterial (see Figure 42)
      - graft choices: vein graft (reversed or in situ), synthetic – polytetrafluoroethylene graft (e.g. Gore-Tex®) or Dacron®
    - ♦ chemical sympathectomy: sympathetic plexus destroyed with EtOH injection into nerve plexus, may stimulate vasodilation (rarely effective)
    - ♦ amputation: if not suitable for revascularization, persistent serious infections/gangrene

**Prognosis**

- claudication: conservative therapy: 60-80% improve, 20-30% stay the same, 5-10% deteriorate, 5% will require intervention within 5 yr, <4% will require amputation
- for patients with critical ischemia (rest pain, night pain, ulceration or gangrene): high risk of limb loss

**Figure 42. Treatment options for critical limb ischemia**

(A) Algorithm for the treatment of critical limb ischemia

(B) Surgical treatment options for the treatment of aortoiliac disease

Modified from Beard JD. Chronic lower limb ischemia. *BMJ*. 2000;320:854-857

## Hypertension

- see [Family Medicine](#), FM37

## Pulmonary Hypertension

- see [Respirology](#), R16

## Aortic Disease

- see 2010 ACCF/AHA/AATS/ACR/ASA/SCA/SCAI/SIR/STS/SVM Guidelines for the Diagnosis and Management of Patients With Thoracic Aortic Disease. *J Am Coll Cardiol* 2010;55(14):e27–e129 for details

## Aortic Anatomy

- see Figure 43

## Aortic Dissection

### Definition

- tear in aortic intima allowing blood to dissect into the media; acute <2 wk (initial mortality 1% per hour for type A dissections), chronic >2 wk (mortality levels up to 75–80%)

### Etiology

- most common: HTN → degenerative/cystic changes → damage to aortic media
- other: connective tissue disease (e.g. Marfan's, Ehlers-Danlos), cystic medial necrosis, atherosclerosis, congenital conditions (e.g. coarctation of aorta, bicuspid aortic valves, patent ductus arteriosus), infection (e.g. syphilis), trauma, arteritis (e.g. Takayasu's)

### Epidemiology

- incidence of 5.2 in 1 000 000
- male:female = 3.2:1
- small increased incidence in African-Canadians (related to higher incidence of HTN)
- lowest incidence in Asians
- peak incidence 50–65 yr old; 20–40 yr old with connective tissue diseases

### Clinical Features

- sudden onset tearing chest pain that radiates to back with:
  - HTN (75–85% of patients)
  - asymmetric BPs and pulses between arms (>30 mmHg difference indicates poor prognosis)
  - ischemic syndromes due to occlusion of aortic branches: coronary (MI), carotids (ischemic stroke, Horner's syndrome), splanchnic (mesenteric ischemia), renal (AKI), peripheral (ischemic leg), intercostal vessels (spinal cord ischemia)
  - "unseating" of aortic valve cusps (new diastolic murmur in 20–30%)
  - rupture into pleura (dyspnea, hemoptysis) or peritoneum (hypotension, shock) or pericardium (cardiac tamponade)
  - syncope

### Investigations

- CXR
  - pleural cap (pleural effusion in lung apices)
  - widened mediastinum
  - left pleural effusion with extravasation of blood
- TEE: can visualize aortic valve and thoracic aorta but not abdominal aorta
- ECG: LVH ± ischemic changes, pericarditis, heart block
- CT (gold standard), aortography, MRA: 100% sensitive and specific
- bloodwork: lactate (r/o ischemic gut), amylase (r/o pancreatitis), troponin (r/o MI)

### Treatment

- pharmacologic
  - β-blocker to lower BP and decrease cardiac contractility
  - use nondihydropyridine calcium channel blocker if there is a clear contraindication to β-blockers
  - target sBP of 110 mmHg and HR of less than 60 bpm
  - ACEI and/or other vasodilators if insufficient BP or HR control
- surgical
  - urgent surgical consult if thoracic aortic dissection diagnosed or highly suspected
  - resection of segment with intimal tear
  - reconstitution of flow through true lumen
  - replacement of the affected aorta with prosthetic graft
  - correction of any predisposing factors

Figure 43. Aortic anatomy

- post-operative complications: renal failure, intestinal ischemia, stroke, paraplegia, persistent leg ischemia, death
- 2/3 of patients die of operative or post-operative complications
- Type A: requires emergent surgery with cardiopulmonary bypass;
  - ♦ may require:
    - hypothermic circulation for transverse arch dissections
    - resuspension of aortic valve
    - aortic valve replacement
    - coronary re-implantation for aortic root involvement
  - ♦ initial mortality rate without surgery is 3% per h for first 24 h, 30% 1 wk, 80% 2 wk
- Type B: managed medically in absence of malperfusion syndrome
  - ♦ <10-20% require urgent operation for complications
  - ♦ treatment can be surgical or endovascular
- with treatment, 60% 5 yr survival, 40% 10 yr survival

## Aortic Aneurysm

### Definition of Aneurysm

- localized dilatation of an artery having a diameter at least 1.5 times that of the expected normal diameter
  - true aneurysm: involving all vessel wall layers (intima, media, adventitia)
  - false aneurysm (also known as pseudo-aneurysm): disruption of the aortic wall or the anastomotic site between vessel and graft with containment of blood by a fibrous capsule made of surrounding tissue
- aneurysms can rupture, thrombose, embolize, erode, and fistulize

### Classification

- thoracic aortic aneurysm (TAA): ascending, transverse arch, descending
- thoracoabdominal
- abdominal aortic aneurysm (AAA): 90-98% are infrarenal

### Etiology

- degenerative (atherosclerotic)
- traumatic
- mycotic (*Salmonella*, *Staphylococcus*, usually suprarenal aneurysms)
- connective tissue disorder (Marfan syndrome, Ehlers-Danlos syndrome)
- vasculitis
- infectious (syphilis, fungal)
- ascending thoracic aneurysms are associated with bicuspid aortic valve
- risk factors: smoking, HTN, age >70, family history

### Epidemiology

- incidence 4.7 to 31.9 per 100 000 for AAA and 5.9 per 100 000 for TAA
- high risk groups
  - 65 yr and older
  - male:female = 3.8:1
  - PVD, CAD, CVD
  - family history of AAA

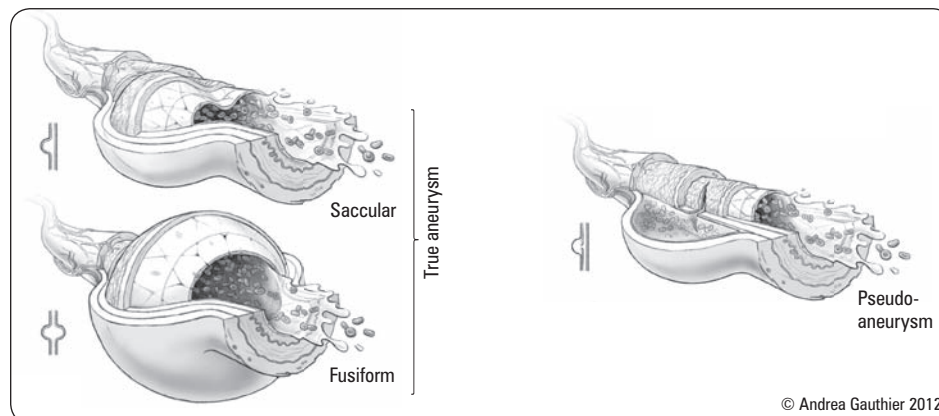

Figure 45. Classification of aneurysms

### Does This Patient have an Acute Thoracic Aortic Dissection

JAMA 2002;287:2262-2272

	LR + (95% CI)	LR - (95% CI)
<b>History</b>		
Hypertension	1.6 (1.2-2.0)	0.5 (0.3-0.7)
Sudden onset of pain*	1.6 (1.0-2.4)	0.3 (0.2-0.5)
"Tearing" or "ripping" pain	1.2-11	0.4-1.0
Migratory pain	-7.6	0.6-1.0
<b>Physical Examination</b>		
Pulse deficit*	5.7 (1.4-23)	0.7 (0.6-0.9)
Focal neurologic deficits	6.6-33	0.7-0.9
Diastolic murmur	1.4 (1.0-2.0)	0.9 (0.8-1.0)
<b>Investigation</b>		
Enlarged aorta or wide mediastinum*	2.0 (1.4-3.1)	0.3 (0.2-0.4)

\*Combination of findings increases LR+: if no findings LR+ 0.1, if one LR+ 0.5, if two LR+ 5.3, if three LR+ 6.6

DeBakey: Type I: 50% Type II: 35%  
Stanford: Type A

DeBakey: Type IIIA 15% Type IIIB  
Stanford: Type B

Figure 44. Classification of aortic dissection (black arrow indicates where the dissection begins)

ACC/AHA 2005 Guidelines define an AAA when the minimum AP diameter of abdominal aorta  $\geq 3.0$  cm.

© Andrea Gauthier 2012

## Clinical Features

- common presentation: due to acute expansion or disruption of wall
  - syncope
  - pain (chest, abdominal, flank, back)
  - hypotension
  - palpable pulsatile mass above the umbilicus, pulsatile abdominal mass in two directions (expandable)
  - airway or esophageal obstruction, hoarseness (left recurrent laryngeal nerve paralysis), hemoptysis, or hematemesis (indicates thoracic or thoracoabdominal aortic aneurysm)
  - distal pulses may be intact
- 75% asymptomatic (discovered incidentally)
- uncommon presentation
  - ureteric obstruction and hydronephrosis (often with inflammatory aortic aneurysm)
  - GI bleed (duodenal mucosal hemorrhage, aortoduodenal fistula)
  - aortocaval fistula
  - distal embolization (blue toe syndrome)
- associated diseases
  - HTN, PVD, CAD, COPD, renal insufficiency
- most commonly in the abdominal aorta (50% abdominal aorta, 40% thoracic aorta, 10% ascending aorta)

## Investigations

- bloodwork: CBC, electrolytes, urea, creatinine, PTT, INR, type and cross
- abdominal U/S (100% sensitive, up to  $\pm 0.6$  cm accuracy in size determination)
- CT (accurate visualization, size determination)
- MRI (accurate visualization, limited access)
- aortogram (only for EVAR)
- Doppler/duplex (r/o vascular tree aneurysms elsewhere, e.g. popliteal)

## Treatment

- conservative
  - cardiovascular risk factor reduction: smoking cessation; control of HTN, DM, and hyperlipidemia
  - regular exercise
  - watchful waiting, U/S every 6 mo to 3 yr depending on size and location
- surgical
  - when risk of rupture greater than or equal to risk of surgery ( $>5.5$  cm)
  - risk of rupture depends on
    - ♦ size
    - ♦ rate of enlargement (if  $>0.4$  cm/yr)
    - ♦ symptoms, comorbidities (HTN, COPD, dissection), smoking
  - elective AAA repair mortality 2-5%; elective TAA repair mortality  $<10\%$  (highest with proximal aortic and thoracoabdominal repairs)
  - consider revascularization for patients with CAD before elective repair of aneurysm
  - indications
    - ♦ general: ruptured, symptomatic, mycotic, associated with acute Type A dissection or complicated Type B dissection or when risk of rupture is greater than risk of surgery (size  $>5.5$  cm or  $>2\times$  normal lumen size)
    - ♦ ascending thoracic aortic aneurysms
      - symptomatic, enlarging, diameter  $>5.5$  cm or  $>2\times$  normal lumen size,  $>4.5$  cm and aortic regurgitation (annuloaortic ectasia);  $\geq 4.5$ -5 cm in Marfan syndrome
  - contraindications: life expectancy  $<1$  yr, terminal disease (e.g. cancer), significant comorbidities (e.g. recent MI, unstable angina), decreased mental acuity, advanced age
  - surgical options
    - ♦ open surgery (laparotomy or retroperitoneal) with graft replacement
      - possible complications
      - early: renal failure, spinal cord injury (paraparesis or paraplegia), impotence, arterial thrombosis, anastomotic rupture or bleeding, peripheral emboli
      - late: graft infection/thrombosis, aortoenteric fistula, anastomotic (pseudo) aneurysm
    - ♦ endovascular aneurysm repair (EVAR)
      - newer procedure; high success rates in patients with suitable anatomy and experienced centres
      - advantages: decreased morbidity and mortality, procedure time, need for transfusion, ICU admissions, length of hospitalization, and recovery time
      - disadvantages: endoleak rates as high as 20-30%, device failure increasing as longer follow-up periods are achieved, re-intervention rates 10-30%, cost-effectiveness is an issue (devices are very expensive), radiation exposure
      - complications
        - early: immediate conversion to open repair, groin hematoma, arterial thrombosis, iliac artery rupture, and thromboemboli
        - late: endoleak (see sidebar), severe graft kinking, migration, thrombosis, rupture of aneurysm

### Classic Triad of Ruptured AAA

- Pain
- Hypotension
- Pulsatile abdominal mass

### CCS PAD Guidelines 2006 recommend AAA screening among:

- Men aged 65-74
- Women aged 65 with cardiovascular disease and positive family history of AAA
- Men aged 50 and above with a positive family history

### CCS PAD Guidelines 2006 recommend AAA follow-up based on initial size:

Size	Guideline
$<3.0$ cm	Repeat ultrasound follow-up in 3-5 yr
3.1-3.4 cm	Repeat ultrasound in 3 yr
3.5-3.9 cm	Repeat ultrasound in 2 yr
4.0-4.5 cm	Repeat ultrasound in 1 yr
$\geq 4.5$ cm	Referral to vascular surgeon and repeat ultrasound every 6 mo
If $>1$ cm growth in one yr	Referral to vascular surgeon for consideration of repair

### Management of Ruptured AAA

- ABCs
- No imaging (hemodynamically unstable)
- Straight to OR (confirm diagnosis by laparotomy)
- Crossmatch 10 units packed RBCs

### Risk of AAA Rupture

Size (diameter)	1-yr rupture risk
$<4$ cm	0%
4-4.9 cm	1%
5-5.9 cm	5-10%
6-6.9 cm	10-20%
7-7.9 cm	20-40%

### Endoleak Types

**Definition:** persistent blood flow into the aneurysm sac

**Type I:** ineffective seal at ends of graft

**Type II:** backflow from collateral vessels

**Type III:** ineffective seal of graft joints or rupture of graft fabric

**Type IV:** flow through pores of graft fabric

# Peripheral Venous Disease

## Deep Venous Thromboembolism

- see [Hematology](#), H31

## Superficial Venous Thrombosis (SVT)

### Definition

- erythema, induration, and tenderness along the superficial vein; usually spontaneous but can follow venous cannulation

### Etiology

- infectious: suppurative phlebitis (complication of IV cannulation; associated with fever/chills)
- trauma
- inflammatory: varicose veins, migratory superficial thrombophlebitis, Buerger's disease, SLE
- hematologic: polycythemia, thrombocytosis
- neoplastic: occult malignancy (especially pancreatic)
- idiopathic

Migratory superficial thrombophlebitis is often a sign of underlying malignancy ("Trousseau's disease").

### Clinical Features

- most common in greater saphenous vein and its tributaries
- pain and cord-like swelling along course of involved vein
- areas of induration, erythema, and tenderness correspond to dilated and often thrombosed superficial veins
- complications
  - simultaneous DVT (up to 20% of cases), PE (rare unless DVT)
  - recurrent superficial thrombophlebitis

### Investigations

- non-invasive tests (e.g. Doppler) to exclude associated DVT

### Treatment

- conservative
  - moist heat, compression bandages, mild analgesic, anti-inflammatory and anti-platelet (e.g. ASA), LMWH, ambulation
- surgical excision of involved vein
  - indication: failure of conservative measures (symptoms that persist over 2 wk)
  - suppurative thrombophlebitis: broad-spectrum IV antibiotics and excision

## Varicose Veins

### Definition

- distention of tortuous superficial veins resulting from incompetent valves in the deep, superficial, or perforator systems
- distribution: greater saphenous vein and tributaries (most common), esophagus, anorectum, scrotum

### Etiology

- primary
  - main factor: inherited structural weakness of valves
  - contributing factors: increasing age, female gender, OCP use, occupations requiring long hours of standing, pregnancy, obesity
- secondary
  - malignant pelvic tumours with venous compression
  - congenital anomalies, arteriovenous fistulae

### Epidemiology

- primary varicose veins are the most common form of venous disorder of lower extremity
- 10-20% of population

**Clinical Features**

- diffuse aching, fullness/tightness, nocturnal cramping
- aggravated by prolonged standing (end of day), premenstrual
- visible long, dilated and tortuous superficial veins along thigh and leg
- ulceration, hyperpigmentation, and induration (secondary varicosities)
- Brodie-Trendelenberg test (valvular competence test)
- with patient supine, raise leg and compress saphenous vein at thigh, have patient stand – if veins fill quickly from top down then incompetent valves; use multiple tourniquets to localize incompetent veins

**Complications**

- recurrent superficial thrombophlebitis
- hemorrhage: external or subcutaneous
- ulceration, eczema, lipodermatosclerosis, and hyperpigmentation

**Treatment**

- largely a cosmetic problem
- conservative: elevation of leg and/or elastic compression stockings
- surgical: high ligation and stripping of the long saphenous vein and its tributaries, ultrasound-guided foam sclerotherapy, endovenous laser therapy (EVLT)
- indications for surgery: symptomatic varix (pain, bleeding, recurrent thrombophlebitis), tissue changes (hyperpigmentation, ulceration), failure of conservative treatment, cosmetics

**Prognosis**

- benign course with predictable complications
- almost 100% symptomatic relief with treatment if varicosities are primary
- good cosmetic results with treatment
- significant post-operative recurrence, especially with sclerosing agent injection

## Chronic Venous Insufficiency (CVI)

**Definition**

- venous insufficiency and skin damage

**Etiology**

- calf muscle pump dysfunction and valvular incompetence (valvular reflux) due to phlebitis, varicosities, or DVT
- venous obstruction
- AV fistulas, venous malformations

**Clinical Features**

- pain (most common), ankle and calf edema – relieved by foot elevation
- pruritus, brownish hyperpigmentation (hemosiderin deposits)
- stasis dermatitis, subcutaneous fibrosis if chronic (lipodermatosclerosis)
- ulceration: shallow, above medial malleolus, weeping (wet), painless, irregular outline
- signs of DVT/varicose veins/thrombophlebitis

**Investigations**

- ambulatory venous pressure measurement (gold standard)
- Doppler U/S (most commonly used)
- photoplethysmography

**Treatment**

- conservative
  - elastic compression stockings, leg elevation, avoid prolonged sitting/standing
  - ulcers: zinc-oxide wraps, split-thickness skin grafts, antibiotics, debridement
- surgical
  - if conservative measures fail, or if recurrent/large ulcers
  - surgical ligation of perforators in region of ulcer, (GSV/LSV ligation and stripping)

## Lymphedema

### Definition

- obstruction of lymphatic drainage resulting in edema with high protein content

### Etiology

- primary: Milroy's syndrome (congenital hereditary lymphedema)
- secondary:
  - infection: filariasis (#1 cause worldwide), post-operative
  - malignant infiltration: axillary, groin or intrapelvic
  - radiation/surgery (axillary, groin lymph node removal): #1 cause in North America

### Clinical Features

- classically non-pitting edema
- impaired limb mobility, discomfort/pain, psychological distress

### Treatment

- avoid limb injury (can precipitate or worsen lymphedema)
- skin hygiene
  - daily skin care with moisturizers
  - topical treatment of fungal infection; systemic treatment of bacterial infection
- external support
  - intensive: compression bandages
  - maintenance: lymphedema sleeve
- exercise
  - gentle daily exercise of affected limb, gradually increasing ROM
  - must wear a compression sleeve/bandages when doing exercises
- massage and manual lymph drainage therapy

### Prognosis

- if left untreated becomes resistant to treatment due to subcutaneous fibrosis
- cellulitis causes rapid increase in swelling: can lead to sepsis and death

## Common Medications

**Table 19. Commonly Used Cardiac Therapeutics**

Drug Class	Examples	Mechanism of Action	Indications	Side Effects	Contraindications
ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)					
	enalapril (Vasotec®), perindopril (Coversyl®), ramipril (Altace®) lisinopril (Zestril®)	Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis	HTN, CAD, CHF, post-MI, DM	Dry cough, 10% hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema	Bilateral renal artery stenosis, pregnancy, caution in decreased GFR
ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)					
	candesartan, irbesartan, valsartan	Block AT II receptors, causing similar effects to ACEI	Same as ACEI, although evidence is generally less for ARBs. Often used when ACEI are not tolerated	Similar to ACEI, but do not cause dry cough	Same as ACEI
DIRECT RENIN INHIBITORS (DRIs)					
	aliskiren	Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I. This also causes a decrease in AT II	HTN (exact role of this drug remains unclear)	Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure	Pregnancy, severe renal impairment
β-BLOCKERS					
β1 antagonists	atenolol, metoprolol, bisoprolol	Block β-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand, slow conduction through the AV node	HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT	Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud's phenomenon and claudication	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW. Caution in asthma, claudication, Raynaud's phenomenon, and decompensated CHF
β1/β2 antagonists	propranolol				
α1/β1/β2 antagonists	labetalol, carvedilol				
β1 antagonists with intrinsic sympathomimetic activity	acebutalol				
CALCIUM CHANNEL BLOCKERS (CCBs)					
Benzothiazepines Phenylalkylamines (non-dihydropyridines)	diltiazem verapamil	Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers Also vasodilate	HTN, CAD, SVT, diastolic dysfunction	Hypotension, bradycardia, edema Negative inotrope	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW, CHF
Dihydropyridines	amlodipine (Norvasc®), nifedipine (Adalat®), felodipine (Plendil®)	Block smooth muscle calcium channels causing peripheral vasodilation	HTN	Hypotension, edema, flushing, headache, light-headedness	Severe aortic stenosis and liver failure
DIURETICS					
Thiazides	hydrochlorothiazide, chlorthalidone metolazone	Reduce Na <sup>+</sup> reabsorption in the distal convoluted tubule (DCT)	HTN (drugs of choice for uncomplicated HTN)	Hypotension, hypokalemia, polyuria	Sulfa allergy, pregnancy
Loop diuretics	furosemide (Lasix®)	Blocks Na <sup>+</sup> /K <sup>+</sup> -ATPase in the loop of Henle	CHF, pulmonary or peripheral edema	Hypovolemia, hypokalemic metabolic alkalosis	Hypovolemia, hypokalemia
Aldosterone receptor antagonists	spironolactone, eplerenone	Antagonize aldosterone receptors	HTN, CHF, hypokalemia	Edema, hyperkalemia, gynecomastia	Renal insufficiency, hyperkalemia, pregnancy
INOTROPES					
	digoxin (Lanoxin®)	Inhibit Na <sup>+</sup> /K <sup>+</sup> -ATPase, leading to increased intracellular Na <sup>+</sup> and Ca <sup>2+</sup> concentration and increased myocardial contractility. Also slows conduction through the AV node	CHF, AFib	AV block, tachyarrhythmias, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, nausea and vomiting	2nd or 3rd degree AV block, hypokalemia, WPW

**Table 19. Commonly Used Cardiac Therapeutics** (continued)

Drug Class	Examples	Mechanism of Action	Indications	Side Effects	Contraindications
<b>ANTICOAGULANTS</b>					
Coumarins	warfarin (Coumadin®)	Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X	AFib, LV dysfunction, prosthetic valves	Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis	Recent surgery or bleeding, bleeding diathesis, pregnancy
Heparins	Unfractionated heparin LMWHs: dalteparin, enoxaparin, tinzaparin	Antithrombin III agonist, leading to decreased clotting factor activity	Acute MI; when immediate anticoagulant effect needed	Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs)	Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs)
Direct thrombin inhibitors	dabigatran, melagatran	Competitive, direct thrombin inhibitor; thrombin enables fibrinogen conversion to fibrin during the coagulation cascade, thereby preventing thrombus development	Atrial fibrillation	Bleeding, GI upset	Severe renal impairment, recent surgery, active bleeding
Direct Factor Xa inhibitors	rivaroxaban	Direct, selective and reversible inhibition of factor Xa in both the intrinsic and extrinsic coagulation pathways	Atrial fibrillation	Bleeding, GI upset, elevated liver enzymes	Hepatic disease, active bleeding, bleeding diathesis, pregnancy, lactation
<b>ANTIPLATELETS</b>					
Salicylates	ASA (Aspirin®)	Irreversibly acetylates platelet COX-1, preventing thromboxane A2-mediated platelet aggregation	CAD, acute MI, post-MI, post-PCI, CABG	Bleeding, GI upset, GI ulceration, impaired renal perfusion	Active bleeding or peptic ulcer disease (PUD)
Thienopyridines	clopidogrel (Plavix®) ticlopidine (Ticlid®)	Block platelet ADP receptors	Acute MI, post-MI, post-PCI, CABG	Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine)	Active bleeding or PUD
GPIIb/IIIa inhibitors	eptifibatide, tirofiban, abciximab	Block binding of fibrinogen to Gp IIb/IIIa	Acute MI, particularly if PCI is planned	Bleeding	Recent surgery or bleeding, bleeding diathesis
<b>THROMBOLYTICS</b>					
	alteplase, reteplase, tenecteplase, streptokinase	Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin	Acute STEMI	Bleeding	See Table 6, C25
<b>NITRATES</b>					
	nitroglycerin	Relax vascular smooth muscle, producing venous and arteriolar dilation	CAD, MI, CHF (isosorbide dinitrate plus hydralazine)	Headache, dizziness, weakness, postural hypotension	Concurrent use of cGMP phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure
<b>LIPID LOWERING AGENTS</b>					
Statins	atorvastatin (Lipitor®), pravastatin (Pravachol®), rosuvastatin (Crestor®), simvastatin (Zocor®), lovastatin (Meracor®)	Inhibit HMG CoA reductase, which catalyzes the rate-limiting step in cholesterol synthesis	Dyslipidemia (1° prevention of CAD), CAD, post-MI	Myalgia, rhabdomyolysis, abdominal pain	Liver or muscle disease

## Antiarrhythmics

Figure 46. Representative cardiac action potential

Table 20. Antiarrhythmic\* Drugs (Vaughan-Williams Classification)

Class	Agent	Indications	Side Effects	Mechanism of Action
Ia	quinidine procainamide disopyramide	SVT, VT	Torsades de Pointes (all Ia), diarrhea Lupus-like syndrome Anticholinergic effects	Moderate Na <sup>+</sup> channel blockade Slows phase 0 upstroke Prolongs repolarization, slowing conduction
Ib	lidocaine mexiletine	VT	Confusion, stupor, seizures GI upset, tremor	Mild Na <sup>+</sup> channel blockade Shortens phase 3 repolarization
Ic	propafenone flecainide encainide	SVT, VT AFib	Exacerbation of VT (all Ic) Negative inotropy (all Ic) Bradycardia and heart block (all Ic)	Marked Na <sup>+</sup> channel blockade Markedly slows phase 0 upstroke
II	propranolol metoprolol, etc.	SVT, AFib	Bronchospasm, negative inotropy, bradycardia, AV block, impotence, fatigue	β-blocker Decreases phase 4 depolarization
III	amiodarone** sotalol	SVT, VT AFib SVT, VT, AFib	Photosensitivity, pulmonary toxicity, hepatotoxicity, thyroid disease, increased INR Torsades de Pointes, bradycardia, heart block, β-blocker side effects	Blocks K <sup>+</sup> channel Prolongs phase 3 repolarization, which prolongs refractory period
IV	verapamil diltiazem	SVT AFib	Bradycardia, AV block Hypotension	Calcium channel blocker Slows phase 4 spontaneous depolarization, slowing AV node conduction

\*All antiarrhythmics have potential to be proarrhythmic

\*\*Amiodarone has class I, II, III, and IV properties

### Antiarrhythmic Drug Classification

Some Block Potassium Channels

- I – Sodium channel blocker
- II – β-Blocker
- III – Potassium channel blocker
- IV – CCB

Table 21. Actions of α and β Adrenergic Receptors

	α RECEPTORS		β RECEPTORS	
Target System	α1	α2	β1	β2
Cardiovascular	Constriction of vascular smooth muscle Constriction of skin, skeletal muscle, and splanchnic vessels  Increased myocardial contractility Decreased heart rate	Same as α1   Peripherally act to modulate vessel tone Vasoconstrict and dilate; oppose α1 vasoconstrictor activity	Increased myocardial contractility Accelerate SA node Accelerate ectopic pacemakers	Decreased vascular smooth muscle tone
Respiratory				Bronchodilation
Dermal	Pilomotor smooth muscle contraction Apocrine constriction			
Ocular	Radial muscle contraction		Ciliary muscle relaxation	
Gastrointestinal	Inhibition of myenteric plexus Anal sphincter contraction			
Genitourinary	Pregnant uterine contraction Penile and seminal vesicle ejaculation Urinary bladder contraction	Smooth muscle wall relaxation	Stimulation of renal renin release	Bladder wall relaxation Uterine relaxation
Metabolic	Stimulate liver gluconeogenesis and glycogenolysis at the liver	Same as α1 Fat cell lipolysis	Fat cell lipolysis Glycogenolysis	Gluconeogenesis Fat cell lipolysis

Adapted from the Family Practice Notebook (www.fpnotebook.com/NEU194.htm)

Table 22. Commonly Used Drugs that Act on  $\alpha$  and  $\beta$  Adrenergic Receptors

Mechanism of Action	$\alpha$ RECEPTORS			$\beta$ RECEPTORS		
	$\alpha 1$	$\alpha 1$ and $\alpha 2$	$\alpha 2$	$\beta 1$	$\beta 1$ and $\beta 2$	$\beta 2$
<b>Agonist</b>	Phenylephrine Methoxamine	Epinephrine Norepinephrine	Clonidine Methyldopa	Norepinephrine Dobutamine	Isoproterenol Epinephrine	Albuterol Terbutaline
<b>Antagonist</b>	Prazosin Phenoxybenzamine	Phentolamine	Yohimbine Mirtazipine	Metoprolol Acebutolol Alprenolol Atenolol Esmolol	Propranolol Timolol Nadolol Pindolol Carvedilol	Butoxamine

Adapted from the Family Practice Notebook (<http://www.fpnotebook.com/NEU194.htm>)

## Landmark Cardiac Trials

Trial	Reference	Results
<b>ISCHEMIC HEART DISEASE</b>		
ASCOT-LLA	<i>Lancet</i> 2003; 361:1149-58	In hypertensive patients with risk factors for CHD and average or below-average cholesterol, atorvastatin reduced nonfatal MI, fatal CHD, fatal/nonfatal stroke, coronary events but not all-cause mortality
CAPRIE	<i>Lancet</i> 1996; 348:1329-39	In atherosclerotic vascular disease clopidogrel reduced the primary combined endpoint of stroke, MI or vascular death and improved PAD compared to ASA
CARE	<i>NEJM</i> 1996; 335:1001-9	Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol
CURE	<i>NEJM</i> 2001; 345:494-502	Clopidogrel plus ASA reduced death from CV causes, non fatal MI, or stroke but increased bleeding complications
EUROPA	<i>Lancet</i> 2003; 362:782-88	With stable CAD and no CHF perindopril reduced cardiovascular death, MI, and total mortality
HOPE	<i>NEJM</i> 2000; 342:154-60	In high-risk patients without low LVEF or CHF ramipril reduced rates of death, MI, stroke, revascularization, new diagnosis of diabetes and complications due to diabetes. Vitamin E had no effect on outcomes
HPS	<i>Lancet</i> 2002; 360:7-22	In high-risk patients with various cholesterol values simvastatin reduced all-cause mortality, coronary deaths and major vascular events
JUPITER	<i>NEJM</i> 2008; 359:2195-2207	With low to normal LDL-C and elevated hsCRP treatment with rosuvastatin significantly reduced major cardiovascular events. NNT with rosuvastatin for 2 yr to prevent one primary endpoint = 95
SYNTAX	<i>NEJM</i> 2009; 360:961-972	CABG has lower rate of major cardiac or cerebrovascular events. The rate of stroke was increased with CABG, whereas the rate of repeat revascularization was increased with PCI
TNT	<i>NEJM</i> 2005; 352:1425-35	Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d
WHI	<i>JAMA</i> 2002; 288:321-333	Estrogen plus progestin therapy is associated with increased risks of cardiovascular disease and breast cancer but decreased risks of hip fracture and colorectal cancer in postmenopausal women
<b>MYOCARDIAL INFARCTION</b>		
BHAT	<i>JAMA</i> 1982; 247:1707-14	In acute MI propranolol reduced all-cause mortality, cardiovascular death and sudden death from atherosclerotic heart disease
COURAGE	<i>NEJM</i> 2007; 356:1503-16	Compared with optimal medical therapy alone PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events
ISIS-2	<i>Lancet</i> 1988; 2:349-60	Early therapy with SK and ASA in patients with MI individually and in combination significantly reduced all-cause mortality and in combination demonstrated additive effect
ISIS-4	<i>Lancet</i> 1995; 345:669-85	In patients with suspected or definite acute MI early treatment with captopril reduced all-cause mortality at 35 d and during long-term follow up
OASIS-5	<i>NEJM</i> 2006; 354:1464-76	Compared to enoxaparin, fondaparinux reduced mortality rates, major bleeds at 9 and MI at 30 and 180 d
PROVE IT – TIMI 22	<i>NEJM</i> 2004; 350:1495-1504	In patients hospitalized for ACS high-dose atorvastatin reduced all-cause mortality, MI, unstable angina, revascularization, and stroke compared with pravastatin

Useful app “CHF Trials” available on iTunes®.

Trial	Reference	Results
<b>HEART FAILURE</b>		
AIRE	<i>Lancet</i> 1993; 342:821-8	Ramipril commenced 3-10 d after MI and continued for a mean 15-month period significantly reduced all-cause mortality in patients with non-severe CHF
CHARM	<i>Lancet</i> 2003; 362:759-66	Candesartan reduced overall mortality, cardiovascular death and CHF hospitalizations
CIBIS II	<i>Lancet</i> 1999; 353:9-13	Bisoprolol reduced all-cause mortality, cardiovascular death, all-cause hospitalization, and CHF hospitalization
COMET	<i>Lancet</i> 2003; 362:7-13	Carvedilol was associated with a reduction in all cause mortality compared with metoprolol
CONSENSUS	<i>NEJM</i> 1987; 316:1429-35	Enalapril reduced all-cause mortality, death due to progression of heart failure
COPERNICUS	<i>NEJM</i> 2001; 344:1651-8	Carvedilol in addition to standard treatment significantly reduced the risk of death or hospitalization in patients with severe CHF
I-PRESERVE	<i>NEJM</i> 2008; 359:2456-2467	In patients with CHF and normal LVEF treatment with ARB (irbesartan) did not improve mortality or cardiovascular morbidity compared to placebo
MERIT-HF	<i>Lancet</i> 1999; 353:2001-7	Metoprolol CR/XL daily in addition to optimum standard therapy improved survival in clinically stable patients equating to prevention of 1 death per 27 patients treated per year
RALES	<i>NEJM</i> 1999; 341:709-17	In severe CHF (class III/IV) and LVEF <35% spironolactone reduced all-cause mortality, sudden death, and death due to progression of heart failure
SAVE	<i>NEJM</i> 1992; 327:669-77	Patients with LV dysfunction post-MI long-term captopril over 3.5 yr reduced the risk of death due to cardiovascular causes, recurrent MI, development of severe CHF, and CHF hospitalization
SCD-HeFT	<i>NEJM</i> 2005; 352:225-237	In mild-to-moderate CHF shock-only ICD significantly reduces risk of death. Amiodarone had no benefit compared with placebo in treating patients with mild-to-moderate CHF
SOLVD	<i>NEJM</i> 1991; 325:293-302	In stable chronic CHF with decreased LVEF (<0.35) long-term enalapril reduced death due to all causes and death or hospitalization due to CHF
TRACE	<i>NEJM</i> 1995; 333:1670-6	In patients with LV dysfunction post-MI long-term trandolapril reduced the risk of death or progression to severe CHF and reduced risk of sudden death
V-HeFT II	<i>NEJM</i> 1991; 325:303-10	In chronic CHF enalapril reduced mortality more than hydralazine-isosorbide for at least 2 yr. Treatment with either enalapril or hydralazine-isosorbide increased LVEF
<b>DIABETES</b>		
CARDS	<i>Lancet</i> 2004; 264:685-96	Atorvastatin reduces the risk of cardiovascular events in patients with type 2 DM
ONTARGET	<i>NEJM</i> 2008; 358:1547-59	In patients with vascular disease or DM without CHF telmisartan is equally as effective as ramipril, with telmisartan causing a reduced risk of cough and angioedema, and an increased risk of hypotensive symptoms. Combination therapy offers no advantage
<b>ARRHYTHMIA</b>		
AFFIRM	<i>NEJM</i> 2002; 347:1825-33	No significant difference in mortality rates between rate or rhythm control of AFib
AF-CHF	<i>NEJM</i> 2008; 358:2667-77	In patients with atrial fibrillation and congestive heart failure there is no significant difference in mortality rates from cardiovascular causes between rate and rhythm control
ROCKET-AF	<i>NEJM</i> 2011; 365:883-891	In patients with atrial fibrillation rivoxabarin in non-inferior to warfarin for stroke prevention, and major and non-major bleeding.
<b>HYPERTENSION</b>		
HYVET	<i>NEJM</i> 2008; 358:1887-98	In hypertensive patients >80 yr treatment with indapamide, with or without perindopril, showed a trend towards reduced relative risk of fatal or non fatal stroke
UKHDS (UKPDS)	<i>BMJ</i> 1998; 317:703-13	Hypertensive patients with DM and tight BP control at <150/85 mmHg by use of ACEI or $\beta$ -blocker reduced risk of diabetic complications and death related to DM and reduced risk of end-organ damage
VALUE	<i>Lancet</i> 2004; 363:2022-2031	Valsartan group had higher incidence of MI than amlodipine group, whereas amlodipine had a higher incidence of new onset diabetes

## Acronyms

ACh	acetylcholine	F	bioavailability	P <sub>o/w</sub>	partition coefficient of a drug
ADR	adverse drug reaction	GFR	glomerular filtration rate	Pgp	p-glycoprotein
BBB	blood brain barrier	NE	norepinephrine	TI	therapeutic index
Cl	clearance	PD	pharmacodynamics	Vd	volume of distribution
CYP	cytochrome P450 protein	PK	pharmacokinetics		

# General Principles

## Drug Nomenclature

- **chemical name:** describes chemical structure; same in all countries
  - e.g. *N*-(4-hydroxyphenyl)acetamide is acetaminophen
- **drug identification number (DIN) or national drug code (NDC):** DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name:** approved name (post-phase III trial), official name (listed in pharmacopoeia), or generic name (off-patent)
  - e.g. acetaminophen
- **proprietary (trade) name:** the brand name or registered trademark
  - e.g. Tylenol®
- **street name:** slang term used for a drug of abuse

## Phases of Clinical Testing

- **phase I:** first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II:** first administration to patients, small sample sizes; to determine initial safety and effectiveness, dose range, PK, PD
- **phase III:** large sample sizes, often double-blind RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV:** post-marketing surveillance, wide distribution; to determine rare adverse reactions, effects of long-term use, ideal dosing, effects in real world practice

At the time of drug launch, only data from phases I-III are available; thus true effectiveness (in contrast to efficacy) and safety may be unknown because real-world patients and usage patterns sometimes differ significantly from those in premarket phases.

## Drug Administration

- choice of route of administration depends on
  - drug properties
  - local and systemic effects (limiting action or adverse events)
  - desired onset and/or duration of action
  - patient characteristics

Table 1. Routes of Drug Administration

Route	Advantage	Disadvantage
<b>Oral (PO)</b>	Convenient, easy to administer Large surface area for absorption Inexpensive relative to parenteral administration	Drug metabolism by GI secretions Incomplete absorption Hepatic first-pass effect Potential GI irritation
<b>Buccal/Sublingual (SL)</b>	Rapid onset of action No hepatic first-pass effect	Must be lipid-soluble, non-irritating Short duration of action
<b>Rectal (PR)</b>	Almost no hepatic first-pass effect Convenient if NPO, vomiting or unconscious	Inconvenient, irritation at site of application Erratic absorption
<b>Intravenous (IV)</b>	Direct to systemic circulation No hepatic first-pass effect Slow infusion or rapid onset of action Easy to titrate dose	Requires IV access, aseptic technique Hard to remove once administered Risk of infection, bleeding, vascular injury, extravasation Expensive
<b>Intra-arterial</b>	Direct to specific organs (heart, brain) No hepatic first-pass effect	Risk of infection, bleeding, vascular complications
<b>Intramuscular (IM)</b>	Depot storage if oil-based = slow release of drug Aqueous solution = rapid onset of action	Pain at site of injection

### Common Latin Abbreviations

q	each, every
OD/bid/tid/qid	once/twice/three/four times a day
hs	at bedtime
ac/pc/cc	before/after/with meals
prn	as necessary
gtt	drops
ung	ointment
ud	as directed
od/os/ou	right/left/each eye
ad/as/au	right/left/each ear

**Table 1. Routes of Drug Administration** (continued)

Route	Advantage	Disadvantage
<b>Subcutaneous (SC)</b>	Non-irritating drugs, small volumes Constant, even absorption Alternative to IV	Pain at site of injection Smaller volumes than IM May have tissue damage from multiple injections
<b>Intrathecal</b>	Direct into cerebrospinal fluid (CSF) Bypass BBB and blood-CSF barrier	Risk of infection Possibility of brain herniation and coning
<b>Inhalation</b>	Immediate (local) action in lungs Rapid delivery to blood (systemic action) No hepatic first-pass effect	Must be a gas, vapour or aerosol
<b>Topical</b>	Easy to administer Localized (limited systemic absorption)	Effects are mainly limited to site of application
<b>Transdermal</b>	Drug absorption through intact skin No hepatic first-pass effect	Irritation at site of application Delayed onset of action Hydrophilic drugs are not easily absorbed
<b>Others (intraperitoneal, intra-articular)</b>	Local effect	Risk of infection

## Pharmacokinetics (PK)

- study of “what the body does to a drug”
- definition: relationship between drug administration, time-course/rate of distribution, concentrational changes in the body compartments, and the drug's removal from the body

## Absorption

- definition: movement of the drug from the site of administration into plasma

### Mechanisms of Drug Absorption

- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms: active transport, facilitated diffusion, pinocytosis/phagocytosis

### Factors Affecting the Rate and Extent of Drug Absorption

- **partition coefficient** of a drug ( $P_{o/w}$ ), i.e. its relative solubility in oil (lipid) vs. water
- **local blood flow** at the site of administration (e.g. sublingual vessels facilitate rapid absorption from SL)
- **molecular size** (e.g. small molecular weight drugs absorb faster)
- **pH and drug ionization**
  - drugs are usually weak acids (e.g. acetylsalicylic acid) or weak bases (e.g. ketoconazole) and thus have both ionized and non-ionized forms
  - body compartment pH and drug  $pK_a$  determine the ratio of ionized:non-ionized ratio (using the Henderson-Hasselbach equation)
  - non-ionized forms cross cell membranes much faster than ionized (charged) forms
- **total surface area for absorption**
  - small intestinal villi (large surface area) is the primary site of absorption for most oral drugs

### Bioavailability (F)

- definition: fraction of dose after administration that reaches systemic circulation in an unchanged state
- affected by: drug absorption, gut metabolism, and hepatic first-pass effect
- IV dose has 100% bioavailability ( $F = 1$ )
- drugs with a low bioavailability by PO may require a much larger oral dose when compared to the IV dose (e.g.  $\beta$ -blockers: metoprolol 5 mg IV vs. metoprolol 50 mg PO)

### First-Pass Effect

- definition: drug metabolism by the liver and sometimes the gut before it reaches systemic circulation, resulting in reduced drug bioavailability
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- occurs to much lesser extent with PR administration because drug absorbed in colon bypasses the portal system: colon (absorption) → internal pudendal veins → IVC → systemic circulation

#### Partition Coefficient ( $P_{o/w}$ )

- Ratio of a drug's solubility in oil/lipid (e.g. cell membrane) as compared to water (e.g. extracellular fluid)
- A large  $P_{o/w}$  (e.g. anesthetics) means that a drug is highly soluble in lipid and will cross membranes easily

#### Drug Ionization Reaction and the Henderson-Hasselbach Equation

for a weak acid:

$HA \rightleftharpoons A^- + H^+$ ;  $pK_a = pH + \log [HA/A^-]$   
e.g. drug  $pK_a = 4.4$  at a gastric pH of 1.4,  
non-ionized:ionized =  $HA:A^- = 1:0.001$   
Thus, weak acids are mainly non-ionized and more readily absorbed in stomach.

for a weak base:

$BH^+ \rightleftharpoons B + H^+$ ;  $pK_a = pH + \log [BH^+/B]$   
Weak bases more readily absorbed in small intestine (pH ~6.0-9.0)

#### Examples of Drugs with High First Pass Effect (Hepatic Extraction)

- Levodopa
- Morphine
- Propranolol
- Lidocaine
- Organic nitrates

#### Examples of Drugs with Low First Pass Effect

- Diazepam
- Digoxin
- Phenytoin
- Warfarin

### Efflux Pump

- P-glycoprotein (Pgp) is a protein in the GI tract, renal epithelium, and elsewhere that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- acts to reduce intestinal absorption and enhance renal elimination of certain drugs, e.g. digoxin, dabigatran, etexilate, etoposide, paclitaxel, tacrolimus, cyclosporine
- some drugs (e.g. macrolide antibiotics) inhibit Pgp function, leading to increased levels of Pgp substrates. Pgp inducers (e.g. St. John's Wort) do the opposite
- some tumours overexpress Pgp leading to multi-drug resistance to chemotherapy agents

## Distribution

- definition: movement of drugs between different body compartments and to the site of action
- major body fluid compartments: plasma, interstitial fluid, intracellular fluid, transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments: fat, brain

### Factors Affecting the Rate and Extent of Drug Distribution

- physiochemical properties of the drug (e.g. partition coefficient)
- pH of fluid
- plasma protein binding
- binding within compartments (depots, e.g. % body fat)
- cardiac output
- regional blood flow

### Volume of Distribution ( $V_d$ )

- maximum actual  $V_d$  (anatomic fluid volume accessible to drug) = total body water (TBW ~40 L for average adult) (see Figure 1)
- $V_d$ : the apparent volume of fluid into which a drug dissolves
  - a calculated value = amount of drug in body ÷ plasma drug concentration
  - a theoretical value that does not correspond to an anatomical space (can exceed TBW)
  - the value takes into account drug distribution into tissues and protein binding
  - small  $V_d$  corresponds to a drug which concentrates in plasma and/or binds plasma proteins to a high degree
  - large  $V_d$  corresponds to a drug which distributes into tissues; most is not in blood (measured) space, and it therefore "appears" to distribute in a large volume
  - volume of distribution of plasma-protein bound drugs can be altered by liver and kidney disease
- example: amiodarone distributes into TBW (actual  $V_d$  = 40 L), but it also concentrates in fat tissues giving instead an apparent  $V_d$  of 400 L; i.e. to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

### Plasma Protein Binding

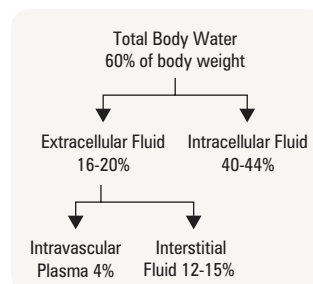

- drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma proteins
    - ♦ acidic drugs bind to albumin
    - ♦ basic drugs bind to  $\alpha_1$ -acid glycoprotein
  2. free or unbound
    - ♦ can leave the circulation to distribute into tissues and exert an effect; subject to metabolism and elimination
- bound fraction is determined by
  - drug concentration, binding affinity, and plasma protein concentration (# of binding sites)
- reduced # of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in an increase in free drug concentration, potentially leading to toxicity (see sidebar). However, more commonly most free drug will be metabolized and toxicity will not be seen

### Depots

- a body compartment where drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wks)

### Barriers (relative)

- body structures that limit or prevent diffusion of drug molecules
  - e.g. the placenta or blood brain barrier (BBB – a barrier composed of tight junctions between capillary endothelial cells and astrocytes)

**Figure 1. Distribution of total body water (TBW)**

Special consideration must be given in dosing patients in **hypoalbuminemic** states (liver failure or nephrotic syndrome) to prevent drug toxicity. Highly protein-bound drugs (e.g. warfarin, digoxin, diazepam, furosemide, amitriptyline) will exert a greater effect in these patients than in healthy individuals because of higher levels of free drug.

Multiple drugs and endogenous substances can **compete** for the same protein binding sites, e.g. ASA displaces highly protein-bound acidic drugs such as phenytoin, thus increasing risk of toxicity; sulfonamide displaces bilirubin, which could potentially lead to jaundice and kernicterus in neonates.

### Main Factors Governing Penetration of Blood Brain Barrier (BBB)

- Small molecular size (<500 Daltons)
- High lipid solubility
- Active transport mechanisms (e.g. Pgp multidrug efflux pump)

### Many Drugs Cross BBB:

- General anesthetics
- Alcohol
- Nicotine
- Caffeine
- L-dopa
- Opioids
- Psychotropic medications

- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. Pgp) which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers

## Metabolism (Biotransformation)

- definition: chemical transformation of a drug *in vivo*
- sites of biotransformation: liver (main), GI tract, lung, plasma, kidney
- goal is to make compounds more hydrophilic to enhance renal elimination
- as a result of the process of biotransformation:
  - a pro-drug may be **activated** (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be **changed** to another active metabolite (e.g. diazepam to oxazepam)
  - a drug may be **changed** to a toxic metabolite (e.g. meperidine to normeperidine)
  - a drug may be **inactivated** (most drugs)

### Drug Metabolizing Pathways

- **phase I (P450) reactions**
  - small molecular changes introduce or unmask polar chemical groups on a parent compound to increase its water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation); the change in  $P_{o/w}$  is typically minimal compared to phase II, and often phase I places a polar 'handle' on a lipophilic drug to allow for phase II
  - mediated by cytochrome P450 enzymes found in the endoplasmic reticulum
  - product of the reaction can be excreted or undergo further phase II reactions
- **phase II (conjugation) reactions**
  - conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
  - dramatically increases water solubility and renal elimination
  - can occur independently of phase I reactions

### Factors Affecting Drug Biotransformation

- **genetic polymorphism** of metabolizing enzymes
  - individuals may metabolize drugs faster or slower depending on their genotype resulting in poor, intermediate, extensive or ultrarapid metabolizers
  - may lead to toxicity or ineffectiveness of a drug at a normal dose, e.g. tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas overactive/duplicated alleles impart "ultrarapid metabolizer" phenotype), while warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to lower dose requirements)
- **enzyme inhibition** may sometimes be due to other drugs
  - P450 enzyme inhibition leads to an increased concentration and bioavailability of the substrate drug
  - e.g. erythromycin, ketoconazole, indinavir and grapefruit juice (CYP3A4 inhibitors) can predispose a patient to drug toxicity from other drugs also metabolized by CYP3A4 (e.g. simvastatin)
- **enzyme induction**
  - certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCP and bilirubin) by inducing the P450 enzyme system
- **liver dysfunction** (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver's reserve capacity
- **renal disease** often results in decreased drug clearance if it is renally cleared
- **extremes of age** (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly
- **nutrition**
  - insufficient protein and fatty acid intake decrease P450 biotransformation
  - vitamin and mineral deficiencies may also impact metabolizing enzymes
- **alcohol**: while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase the risk of hepatocellular damage from acetaminophen by increasing the generation of acetaminophen's toxic metabolite
- **smoking** can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. smokers may require higher doses of theophylline, which is metabolized by CYP1A2)

#### Cytochrome P450 System

The P450 enzymes are a superfamily of heme proteins that are grouped into families and subfamilies according to their amino acid sequence. These proteins are responsible for the metabolism of drugs, chemicals and other substances.

Nomenclature: CYP3A4

"CYP" = cytochrome P450 protein

1st number = family

letter = subfamily

2nd number = isoform

The CYP1, CYP2, and CYP3 families metabolize most drugs in humans. The most important isoforms are CYP3A4 and CYP2D6; therefore, anticipate drug interactions if prescribing drugs using these enzymes.

#### Common Examples of P450 Inhibitors and Inducers

##### P450 inhibitors "MINCE"

Metronidazole (CYP 2C9)

Isoniazid (CYP 2C9), Indinavir (CYP 3A4)

Naringin or bergamottin (bioflavonoid in grapefruit) (CYP 3A4)

Ciprofloxacin (CYP 3A4, 1A2)

Erythromycin (macrolides) (CYP 3A4)

##### P450 inducers

Phenytoin (CYP 3A4)

Dexamethasone (CYP 3A4)

Phenobarbital (CYP 3A4)

Rifampin (CYP 2D6, 3A4)

Smoking (CYP 1A2)

St John's Wort (CYP3A4, CYP2C19, pgp)

Note: The above list is not exhaustive.

The **very** young and the **very** old are **very** sensitive to the actions of drugs.

## Elimination

- definition: removal of drug from the body

### Routes of Drug Elimination

- kidney** (main organ of elimination)
  - two mechanisms for **renal elimination**
    - glomerular filtration**
      - a passive process, so that only the free drug fraction can be filtered
      - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
    - tubular secretion**
      - an active process that is saturable, allowing both protein-bound and free drug fractions to be excreted
      - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
      - drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can be used to reduce the excretion of penicillin, thereby prolonging the half-life and thus the effect of the antibiotic)
  - tubular reabsorption**: drugs can be passively reabsorbed back to the systemic circulation, countering elimination mechanisms
  - renal function** (decreases with age and is affected by many disease states) is assessed clinically by using serum creatinine (Cr) levels
- stool**
  - some drugs and metabolites are actively excreted in the bile (e.g. corticosteroids) or directly into the intestinal tract from systemic circulation
  - enterohepatic reabsorption counteracts stool elimination, and thus can substantially prolong the drug's duration in the body
  - some glucuronic acid conjugates that are excreted in the bile will be hydrolyzed in the intestines by bacteria back to its original form that can be systemically reabsorbed
- lungs**
  - elimination of anesthetic gases and vapours by exhalation
- saliva**
  - saliva concentrations of some drugs parallel their plasma levels (e.g. rifampin)

Avoid toxicity from drug or metabolite accumulation by adjusting a drug's dosage according to the elimination characteristics of the patient (e.g. in renal impairment).

**The Cockcroft-Gault Equation can estimate creatinine clearance (CrCl) in adults 20 yr of age and older:**

For males  

$$\text{CrCl (mL/min)} = \frac{[(140 - \text{age in yr}) \times \text{Weight (kg)}] \times 1.2}{\text{serum Cr (}\mu\text{mol/L)}}$$

For females, multiply above equation x 0.85

Only applies when renal function is at steady state

## Pharmacokinetic Calculation

- definition: the quantitative description of the rates of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on the concentration vs. time graph (see Figure 2)

### Time-Course of Drug Action

- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a  $\log_{10}$  concentration to allow for easier mathematical calculations (see Figure 3)

### Half-Life ( $t_{1/2}$ )

- definition: time taken for the serum drug level to fall 50% during elimination
- for drugs with first order kinetics: takes five half-lives to reach steady state with repeated dosing or for drug elimination once dosing is stopped
- see sidebar for calculation

# of Half Lives	1	2	3	3.3	4	5
Concentration	50%	75%	87.5%	90%	93.8%	96.9%

### Steady State

- drug concentration stays constant when the same amount of drug entering the system is eliminated from the system
- appropriate timing is important for therapeutic monitoring since drug levels are reliable only when the drug has reached steady state (see Figure 4)

### Principles of Pharmacokinetics

$V_d$  = amount of drug in the body/  
plasma drug concentration

Cl = rate of elimination of drug/plasma  
drug concentration

$$\text{Half-life (}t_{1/2}\text{)} = 0.7 \times V_d / \text{Cl}$$

For most drugs it takes 5 half-lives to reach steady state with repeated dosing or to eliminate a drug once dosing is stopped.

**Figure 2. Time course of drug action**

- special situations
  - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
  - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, insulin, unfractionated heparin)

### Clearance (Cl)

- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
- $Cl = \text{rate of elimination of drug} \div \text{plasma drug concentration}$
- must consider clearance from a specific part of the body and total body clearance

### Elimination Kinetics (see Figure 5)

- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the clearance decreases
  - becomes linear relationship when plotted on a log(concentration) vs. time graph (see Figure 3)
- zero-order kinetics (less common, associated with toxicities, e.g. alcohol)
  - a constant rate of drug eliminated regardless of concentration; concept of half-life does not apply

**Table 2. Loading vs. Maintenance Dosing**

Loading Dose	Maintenance Dose
Use when you need an IMMEDIATE effect	After a loading dose OR beginning with maintenance doses
Often parenteral medication	Steady-state levels achieved after ~5 half lives
Rationale: give large dose of medication to "fill up" the volume of distribution	Can be given as either a continuous infusion (relatively rare, short half-life drug) OR much more commonly as intermittent doses

## Pharmacodynamics (PD)

- study of "what a drug does to the body"

## Dose-Response Relationship

- graded dose-response relationships: the response of the drug reflects the number of receptors that are effectively occupied

### Efficacy

- measured as  $E_{\max}$  = the maximal response that a drug can elicit in an RCT or under optimal circumstances (see Figure 6)

### Potency

- measured as  $EC_{50}$  = the effective concentration of a drug needed to produce 50% of  $E_{\max}$  (see Figure 6)
- the drug that reaches its  $EC_{50}$  at the lower dose is the more potent
- overcome low potency by increasing the dose of the drug (e.g. 30 mg vs. 15 mg) to achieve desired response, provided that the higher dose not cause adverse effects

**Figure 6. log(dose)-response curve illustrating efficacy and potency**

**Figure 3. log(concentration) vs. time graph (IV bolus dose)**

**Figure 4. Steady state of a drug**

**Figure 5. First and zero order kinetics**

In first order kinetics (solid line), a constant fraction of the drug is eliminated per unit time; in zero order kinetics (dashed line), a constant amount of the drug is eliminated per unit time.

For unit conversion factors, please see Appendix: Common Unit Conversions.

### Efficacy versus Potency

- Efficacy measures the maximal effect of a drug
- Potency measures the concentration of a drug needed to produce a certain effect

## Effects of Drugs on Receptors

### Agonists

- drugs that mimic endogenous ligands and exert an effect
- have two main properties
  - **affinity**: the ability of the agonist to bind to the receptor (e.g. the  $\beta_2$ -agonist salbutamol has greater affinity for  $\beta_2$ -receptors than  $\beta_1$ -receptors)
  - **efficacy**: the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to  $\beta_2$ -receptors results in smooth muscle relaxation)
- **full agonists**: can elicit a maximal effect at a receptor
- **partial agonists**: can only elicit a partial effect, no matter how high the concentration
  - e.g. reduced efficacy compared to full agonists

### Antagonists

- drugs that have affinity (can bind to a receptor) but exert no effect
- these are drugs that block the action of an agonist or of an endogenous ligand
- **chemical antagonism**: direct chemical interaction between agonist and antagonist that prevents agonist binding to receptor
  - e.g. chelating agents for removal of heavy metals
- **functional antagonism**: two agonists that act independently at different receptors but have opposite physiological effects
  - e.g. acetylcholine at the muscarinic receptor decreases HR, constricts pupils, and stimulates intestinal motility; whereas epinephrine at the adrenergic receptor increases HR, dilates pupils, and decreases intestinal motility
- **reversible competitive antagonism** (most common in clinical practice, see Figure 8)
  - antagonist reversibly binds to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)
- **irreversible antagonism** (see Figure 9)
  - antagonist irreversibly binds to the same receptor as the agonist, blocking it from binding (e.g. Phenoxybenzamine forms a permanent covalent bond with adrenergic receptors preventing adrenaline and noradrenaline from binding)
- **non-competitive antagonism** (see Figure 7)
  - antagonist binds to an alternate site separate but near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)

#### AGONIST BINDING

#### ANTAGONIST BINDING

##### 1) Competitive reversible binding

##### 2) Competitive irreversible binding

##### 3) Non-competitive irreversible binding

Figure 8. The log(dose)-response curve for competitive reversible antagonism

Figure 9. The log(dose)-response curve for irreversible antagonism

## Effectiveness and Safety

### Effectiveness

- $ED_{50}$  (Effective Dose – 50%): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

### Safety

- $LD_{50}$  (Lethal Dose – 50%): the dose of a drug needed to cause death in 50% of a test population of subjects (usually rodents)
- $TD_{50}$  (Toxic Dose – 50%): the dose needed to cause a harmful effect in 50% of a test population of subjects

The two most clinically relevant properties of any drug are effectiveness and safety.

## Therapeutic Indices

### Therapeutic Index (TI): $TD_{50}/ED_{50}$ (see Figure 10)

- reflects the “margin of safety” for a drug – the likelihood of a therapeutic dose causing serious toxicity or death
- the larger the TI, the safer a drug (e.g. warfarin has a narrow TI and requires accurate therapeutic monitoring)
- factors that can change the  $ED_{50}$ ,  $LD_{50}$  or  $TD_{50}$ 
  - presence of interacting drugs
  - changes in drug absorption, distribution, metabolism, elimination

Drugs with a narrow TI have a high likelihood of causing toxicity and need close therapeutic monitoring.

### Certain Safety Factor (CSF): $TD_1/ED_{99}$

- $CSF > 1$  translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population.
- unlike TI, CSF does not take into account the shape of the cumulative dose-response curves of the therapeutic and toxic effects

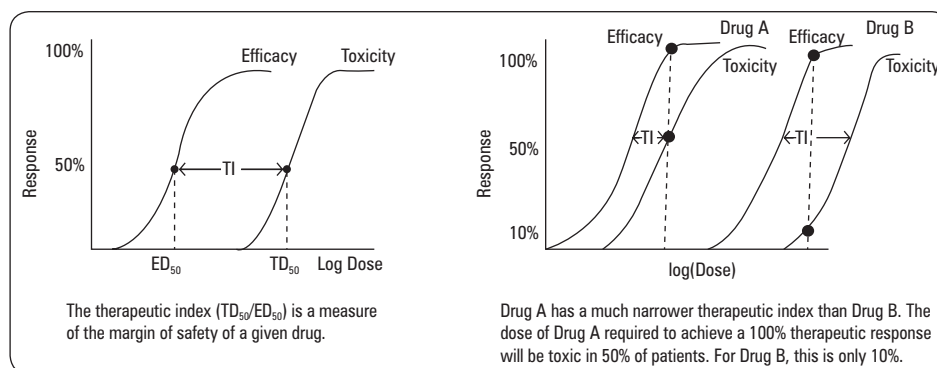

Figure 10.  $ED_{50}$ ,  $TD_{50}$ , and the therapeutic index (TI)

## Therapeutic Drug Monitoring (TDM)

- definition: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance)
  - serum drug samples are usually taken when the drug has reached steady state (e.g. trough level – the lowest level before the next dose)
- TDM can serve to monitor for side effects (e.g. vancomycin trough levels) and for desired effect (e.g. INR when on warfarin therapy)
- TDM is often used for drugs that have:
  - narrow therapeutic index (TI)
  - unpredictable dose-response relationship
  - significant consequences associated with therapeutic failure or toxicity
  - wide inter-patient pharmacokinetic variability

Examples of drugs whose levels need to be monitored: warfarin (via INR levels), digoxin, lithium, anti-epileptics (e.g. phenytoin, carbamazepine), and many others.

## Adverse Drug Reactions (ADRs)

**Table 3. Comparison of Characteristics of Type A and Type B Reactions**

Type A	Type B
Predictable extension of drug's pharmacologic effect	Unpredictable
Usually dose dependent	Rarely dose dependent
Low mortality (some exceptions)	High mortality (some exceptions)
Responds to dose reduction	Responds to drug withdrawal

In Canada, an estimated 1.6% of patients admitted to hospitals experience a serious adverse drug reaction. Furthermore, up to 24% of hospitalizations are drug related, of which 35.5% are adverse drug reactions.

### Type A Drug Reactions

- definition: undesirable normal/augmented responses to the drug (>80% of all ADRs)
- extension of a drug's pharmacological effects (e.g.  $\beta$ -blockers causing bradycardia; acetaminophen causing hepatitis)
- **overdose/toxicity**: exaggerated but characteristic pharmacological effect from supra-therapeutic dose
- **teratogen**: drug may produce developmental defects in fetus (not always in a dose-related manner)

### Type B Drug Reactions

- definition: reactions unrelated to the known pharmacological actions of the drug
- idiosyncratic: uncharacteristic response to drug, unrelated to pharmacology (e.g. sulfa-containing medications causing toxic epidermal necrolysis)
- **allergic/immune-mediated**: does not occur on first exposure (up to 7 d), immediate with subsequent exposure, may occur with low doses, often resolves within 3-4 d of discontinuation
- **pseudoallergic**: mimics immune-mediated reaction

### Type C Drug Reactions

- associated with long-term drug therapy
- effects are well-known and can be anticipated
- i.e. benzodiazepine dependence, analgesic nephropathy

### Type D Drug Reactions

- delayed effects
- carcinogenic or teratogenic

### Other ADR Categories

- type E (end-of-treatment effects)
- type F (failure of therapy)

### Approach to Suspected ADRs

- history and physical examination: signs and symptoms of the reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, dechallenge (response when drug is removed) and rechallenge (response when drug is given again)
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, symptomatic relief
- resources: check recent literature, Health Canada and FDA; contact the pharmaceutical company; call Poison Control (1-888-268-9017) if overdose or poisoning suspected; check with Motherisk ([www.motherisk.org](http://www.motherisk.org)) in cases involving pregnant or breastfeeding women
- Canadian Adverse Drug Reaction Monitoring Program available online for reporting
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity

**Table 4. Sample of Clinically Relevant Adverse Drug Reactions**

Classification	Drug(s)	Adverse Drug Reaction	Comments
A	β-blockers	Bradycardia	Dose dependent
A	ACEI	Cough	Switch ACEI to ARB
A	NSAIDs	GI bleeding	Interruption of mucosal barrier via COX-1 inhibition
A	Opiates	GI upset, constipation, urinary retention	Wean patients to lowest possible opioid dose
A	Acetaminophen	Hepatotoxicity	Depletes pools of glutathione allowing buildup of toxic metabolites
A	Vancomycin	Red Man Syndrome	Pruritic erythematous rash on upper body related to rapid infusion; histamine release Not considered an allergy
A	Aminoglycosides	Ototoxicity and nephrotoxicity	Dose dependent
B	Sulfa Drugs	Stevens-Johnson Syndrome Toxic Epidermal Necrolysis	Life threatening; do not rechallenge under any circumstance
B	Penicillins	Rash	Many children with EBV infection will develop a rash when given amoxicillin; this is NOT a true penicillin allergy
B	Valproic acid, Chinese herbs	Hepatotoxicity	Many other drugs are hepatotoxic (e.g. statins, OCPs, isoniazid)

**Sulfa-Containing Medications**

- Sulfamethoxazole
- Sulfasalazine
- Dapsone

## Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
  - the majority (but not all) of the patients will experience the desired therapeutic effect of a drug with minimal ADRs on the recommended dose
  - may need to adjust dosing or alter medication altogether
- possible causes of individual variability in drug response include problems with:
  - intake
    - ♦ patient adherence, e.g. hard to follow dosing schedule, unpalatable drug, costly drug
  - pharmacokinetics (review pages CP3-CP7)
    - ♦ absorption
      - decreased by vomiting, diarrhea or steatorrhea
      - first pass effect too high due to enzyme induction or too low due to liver disease
      - absorption change due to drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, fluoroquinolones)
    - ♦ distribution
      - very high or low percentage body fat, intact or disrupted BBB
      - patient is elderly or a neonate or has liver dysfunction
    - ♦ biotransformation and elimination
      - certain genetic polymorphisms or enzymes deficiencies to metabolize drugs (e.g. acetylcholinesterase deficiency, CYP polymorphism)
      - kidney or liver dysfunction or obstruction of bile elimination pathway
  - pharmacodynamics
    - ♦ genetic variability in drug response (e.g. malignant hyperthermia due to specific anesthetic agents)
    - ♦ disease process that affects drug pharmacodynamics
    - ♦ drug tolerance or cross-tolerance

## Drug Interactions

- concomitant prescriptions: one drug alters the effect of another by changing its PK fate and/or PD action
- pharmacokinetic interactions involve:
  - absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut mucosal function
  - biotransformation: alterations in drug metabolizing enzymes
  - excretion: alterations in renal elimination
- pharmacodynamic interactions are drug-induced alterations in the effects of other drugs due to exertion of similar changes to the body's physiology (additive) or opposing changes (subtractive)
- drug interactions can also involve herbal medications (e.g. St. John's Wort) and food (e.g. grapefruit)

**Table 5. Examples of Clinically Relevant Drug Interactions**

Interaction	Potential Effect	Comments
<b>Warfarin</b> plus ciprofloxacin, clarithromycin, erythromycin, metronidazole or trimethoprim-sulfamethoxazole	Increased effect of warfarin	Use alternative antibiotic Antibiotics inhibit intestinal production of vitamin K Inhibition of hepatic metabolism of warfarin
<b>Oral contraceptive pills</b> plus rifampin, antibiotics	Decreased effectiveness of oral contraception	Avoid if possible Increased metabolism of exogenous estrogen
<b>Sildenafil</b> plus nitrates	Hypotension	Absolute contraindication Vasodilatation
<b>SSRI</b> plus St. John's wort, naratriptan, rizatriptan, sumatriptan, zolmitriptan	Serotonin syndrome	Avoid if possible Monitor for signs and symptoms of serotonin syndrome
<b>SSRI</b> plus selegiline or non-selective MAO-I	Serotonin syndrome	Avoid Additive serotonergic effects
Some <b>HMG-CoA reductase inhibitors</b> plus niacin, gemfibrozil, erythromycin or itraconazole	Possible rhabdomyolysis	Avoid if possible

## Autonomic Pharmacology

**Figure 11. Subdivisions of the peripheral nervous system**

- most organs are innervated by both sympathetic and parasympathetic nerves; these have opposing effects (see [Neurology](#), Figure 8, N6)
- almost all **ANS efferent tracts** are divided into preganglionic and postganglionic nerves, which synapse in the autonomic ganglion (see Figure 12)
- **sympathetic preganglionic fibers** originate in the spinal cord at spinal levels T1-L3, and terminate in one of two ganglia
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- **parasympathetic preganglionic fibers** originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4; they terminate in the ganglionic cells located near or within the target organ
- blood vessels, sweat glands, spleen capsule, adrenals, do NOT have parasympathetic innervation

**Figure 12. Autonomic nervous system (ANS) efferent tracts**

## Parasympathetic Nervous System (PNS)

- **acetylcholine (ACh)** is the main neurotransmitter of the parasympathetic nervous system
- ACh receptors include
  - **nicotinic (pre-ganglionic) receptors** located in the autonomic ganglia
  - **nicotinic (post-ganglionic) receptors** in the adrenal medulla
  - **muscarinic (only post-ganglionic) receptors**
    - ♦  $M_1$  located in the CNS
    - ♦  $M_2$  receptors located on smooth muscle, cardiac muscle, and glandular epithelium
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
  - e.g. acetylcholinesterase inhibitors (donepezil, galantamine, rivastigmine) are used to increase ACh levels in conditions such as myasthenia gravis and Alzheimer's disease

## Sympathetic Nervous System (SNS)

- **norepinephrine (NE)** is the major neurotransmitter of the SNS
- **receptors** include
  - $\beta_1$ : predominately in cardiac tissue
  - $\beta_2$ : predominately in smooth muscle and glands
  - $\alpha_1$ : predominately on post-synaptic receptors in smooth muscles and glands
  - $\alpha_2$ : predominately on pre-synaptic terminals, where they feed back to inhibit further NE release; also exist as post-synaptic terminals in the brain, uterus, and vascular smooth muscle
- NE action is terminated by reuptake by the presynaptic membrane, diffusion from the synaptic cleft and degradation by **monoamine oxidase (MAO)** and **catechol-O-methyl transferase (COMT)**

**Table 6. Direct Effects of Autonomic Innervation on the Cardiorespiratory System**

Organ	Sympathetic Nervous System		Parasympathetic Nervous System	
	Receptor	Action	Receptor	Action
<b>Heart</b>				
1. Sinoatrial	$\beta_1$	Increased HR	M	Decreased conduction
2. Atrioventricular node	$\beta_1$	Increased conduction	M	Decreased conduction
3. Atria	$\beta_1$	Increased contractility	M	Decreased conduction
4. Ventricles	$\beta_1$	Increased contractility	M	Decreased HR
<b>Blood Vessels</b>				
1. Skin, splanchnic	$\alpha_1, \alpha_2$	Constriction	M	Dilatation
2. Skeletal muscle	$\alpha$	Constriction	M	Dilatation
	$\beta_2$ – large muscles	Dilatation	M	Dilatation
3. Coronary	$\alpha_1, \alpha_2$	Constriction	M	Dilatation
	$\beta_2$	Dilatation	M	Dilatation
<b>Lungs</b>				
1. Bronchiolar smooth muscle	$\beta_2$	Relaxation	M	Constriction
2. Bronchiolar glands	$\alpha_1, \beta_2$	Increased secretion	M	Stimulation

## Common Drug Endings

**Table 7. Common Drug Endings**

Ending	Category	Example
-afil	5-PDE inhibitor	sildenafil
-ane	Inhaled general anesthetic	halothane
-azepam	Benzodiazepine	lorazepam
-azole	Antifungal	ketoconazole
-caine	Local anesthetic	lidocaine
-olol	$\beta$ -blocker	propranolol
-prazole	Proton pump inhibitor	omeprazole
-pril	ACE inhibitor	captopril
-sartan	ARB	candesartan
-statin	HMG-CoA inhibitor	atorvastatin
-terol	$\beta_2$ agonist	albuterol
-tidine	H <sub>2</sub> antagonist	cimetidine
-tropin	Pituitary hormone	somatotropin
-vir	Antiviral	acyclovir
-zosin	$\alpha_1$ antagonist	prazosin

Note: Some medications are exceptions to the rule, e.g. methimazole (antithyroid)

# Introduction to Skin

## Skin Anatomy

**Figure 1. Histologic layers of the skin.** Epidermal layer is detailed in A

### Skin

- divided anatomically into epidermis, dermis, and subcutaneous tissue
- epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale (Figure 1A)
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules which characterize skin
    - stratum lucidum: comprised of transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
- dermis**: comprised of connective tissue divided into two regions (Figure 1B):
  - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
  - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
- subcutaneous tissue** (subdermal)
  - consists primarily of adipose cells, larger caliber vessels, nerves and fascia

### Cells in Epidermis

- keratinocytes**: located in all layers of the epidermis, except the stratum corneum; connected to each other by desmosomes
- melanocytes**: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races
- Langerhans cells**: important for immune surveillance
- Merkel cells**: involved in touch sensation

### Skin Appendages

- epidermal in origin; can extend into the dermis, includes hair, nails, and cutaneous glands

### Cutaneous Glands

- sebaceous gland**: part of pilosebaceous unit, produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface except palms and soles
- apocrine sweat gland**: apocrine duct empties into hair follicle above sebaceous gland
  - found in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- eccrine sweat gland**: not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

### Layers of the Epidermis

## Acronyms

β-hCG	beta-human chorionic gonadotropin
AAFP	American Association of Family Physicians
AD	atopic dermatitis
AK	actinic keratosis
ASA	acetylsalicylic acid
ASO	anti-streptolysin O
BCC	basal cell carcinoma
BSA	body surface area
BUN	blood urea nitrogen
C&S	culture and sensitivity
CBC	complete blood count
CMV	cytomegalovirus
CNS	central nervous system
Cr	creatinine
DLE	discoid lupus erythematosus
DM	diabetes mellitus
DVT	deep vein thrombosis
EM	erythema multiforme
ESR	erythrocyte sedimentation rate
Fe	iron
FTA-ABS	fluorescent treponemal antibody-absorption
GAS	group A β-hemolytic <i>Streptococcus</i>
GVHD	graft-versus-host disease
HHV	human herpes virus
HPA	hypothalamic-pituitary-adrenal
HPV	human papilloma virus
HRT	hormone replacement therapy
HSV	herpes simplex virus
HZV	herpes zoster virus
IFN	interferon
IVIG	intravenous immunoglobulin
LFT	liver function test
MAOI	monoamine oxidase inhibitor
MM	malignant melanoma
MMR	measles/mumps/rubella
MTP	metatarsal phalangeal
NB-UVB	narrow band ultraviolet wavelength B
NCN	neocellular nevus
Nd: Yag	neodymium-doped yttrium aluminum garnet
NMN	nevomelanocytic nevi
NMSC	non-melanoma skin cancers
NSAID	nonsteroidal anti-inflammatory drug
OC	oral contraceptive pill
OTC	over-the-counter
PABA	para-aminobenzoic acid
PASI	Psoriasis Area and Severity Index
PPD	purified protein derivative
PUVA	psoralens and long wave ultraviolet radiation
RA	rheumatoid arthritis
SCC	squamous cell carcinoma
SHBG	sex hormone-binding globulin
SJS	Stevens-Johnson Syndrome
SLE	systemic lupus erythematosus
SPF	sun protection factor
SSRI	selective serotonin reuptake inhibitor
SSSS	staphylococcal scalded skin syndrome
STI	sexually transmitted infection
TB	tuberculosis
TEN	toxic epidermal necrolysis
TMP/SMX	trimethoprim-sulfamethoxazole
TSH	thyroid stimulating hormone
UC	ulcerative colitis
URTI	upper respiratory tract infection
UV	ultraviolet
UVA	ultraviolet wavelength A
UVB	ultraviolet wavelength B
UVC	ultraviolet wavelength C
VDRL	venereal disease research laboratory
VZV	varicella zoster virus

## Skin Function

- **protection**
  - due to continuous recycling and avascularity of epidermis
  - barrier to: UV radiation, mechanical/chemical insults, pathogens and dehydration
- **thermal regulation**
  - insulation to maintain body temperature in cool environments, via peripheral vasoconstriction, hair and subcutaneous adipose tissue
  - dissipation of heat in warm environments, via increased activity of sweat glands and increased blood flow within dermal vascular networks
- **sensation**
  - touch, pain, and temperature sensation
- **metabolic function**
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

## Definitions

### Primary Morphological Lesions

#### Definition

- an initial lesion that has not been altered by trauma or manipulation and has not regressed
- **macule**: flat lesion <1 cm
- **patch**: flat lesion ≥1 cm
- **papule**: elevated, palpable lesion <1 cm
- **plaque**: elevated, palpable lesion ≥1 cm
- **nodule**: deep, palpable lesion <1 cm, often dermal or subcutaneous in origin
- **tumour**: deep, palpable lesion ≥1 cm
- **vesicle**: fluid-filled lesion <1 cm
- **bulla**: fluid-filled lesion ≥1 cm
- **cyst**: an epithelial-lined collection containing semi-solid or fluid material
- **pustule**: an elevated lesion containing purulent fluid (white, grey, yellow, green)
- **erosion**: a disruption of the skin involving the epidermis alone; heals without scarring
- **ulcer**: a disruption of the skin that extends into the dermis or deeper; heals with scarring
- **indurated**: descriptive term for a lesion that is hard or firm
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheel**: a special form of papule or plaque that is blanchable and transient, formed by edema in the dermis (e.g. urticaria)

Table 1. Types of Lesions

Profile	<1 cm Diameter	≥1 cm Diameter
Flat lesion	Macule (e.g. freckle)	Patch (e.g. vitiligo)
Raised superficial lesion	Papule (e.g. wart)	Plaque (e.g. psoriasis)
Deep palpable (dermal or subcutaneous)	Nodule (e.g. dermatofibroma)	Tumour (e.g. lipoma)
Elevated fluid-filled lesions	Vesicle (e.g. HSV)	Bulla (e.g. bullous pemphigoid)

#### Describe a Lesion with SCALDA

**Size and Surface area**  
**Colour** (e.g. hyperpigmented, hypopigmented, erythematous)  
**Arrangement** (e.g. solitary, linear, reticulated, grouped, herpetiform)  
**Lesion morphology** (see Table 1)  
**Distribution** (e.g. dermatomal, intertriginous, symmetrical/asymmetrical, follicular)  
**Always check hair, nails, mucous membranes and intertriginous areas**

#### Skin Phototypes (Fitzpatrick)

Phototype	Colour of Skin	Skin's Response to Sun Exposure (without SPF protection)
I	White	Always burns, never tans
II	White	Always burns, little tan
III	White	Slight burn, slow tan
IV	Pale brown	Slight burn, faster tan
V	Brown	Rarely burns, dark tan
VI	Dark brown or black	Never burns, dark tan

## Secondary Morphological Lesions

#### Definition

- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- **crust**: dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- **scale**: excess keratin (e.g. seborrheic dermatitis)
- **lichenification**: thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- **fissure**: a linear slit-like cleavage of the skin
- **excoriation**: a scratch mark
- **xerosis**: pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes
- **atrophy**: histological decrease in size and number of cells or tissues, resulting in thinning or depression of the skin

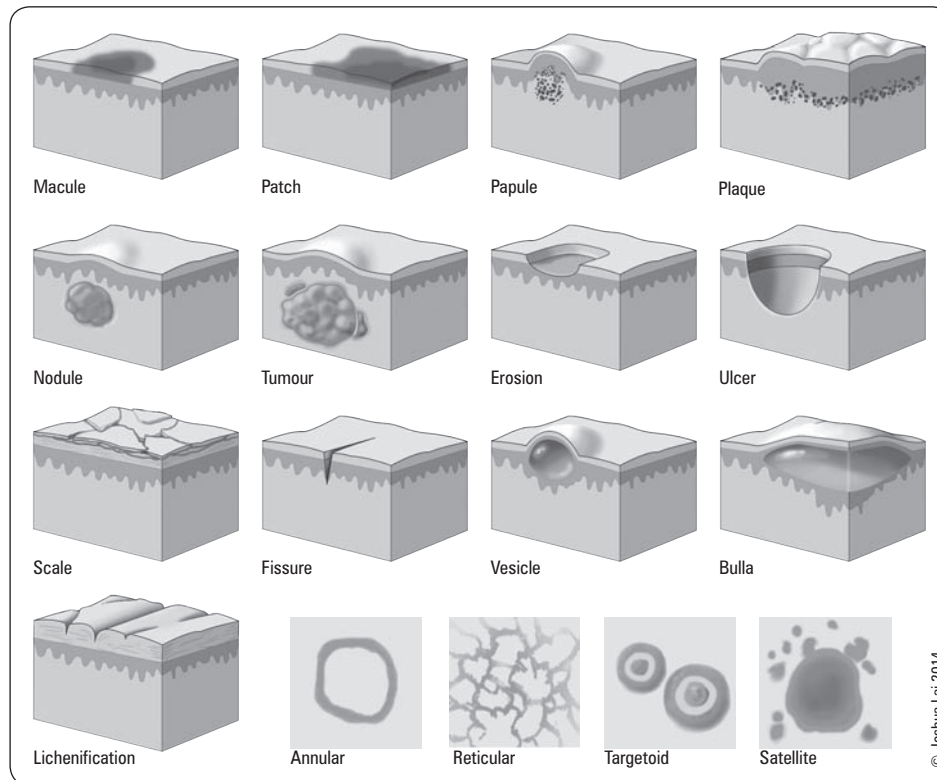

Figure 2. Examples of primary and secondary morphology

## Other Morphological Lesions

- **comedones**: collection of sebum and keratin
  - open comedo (blackhead)
  - closed comedo (whitehead; differentiated from pustule)
- **purpura**: extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, 3 mm-1 cm in size
  - **petechiae**: small pinpoint purpura, <3 mm in size
  - **ecchymoses**: larger flat purpura, >1 cm in size, aka a “bruise”
- **telangiectasia**: dilated superficial blood vessels; blanchable

## Patterns and Distribution

- **acral**: relating to the hands and feet (e.g. hand, foot and mouth disease)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a “drop-like” pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: aka isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo). An isomorphic reaction that develops in areas of trauma (linear exposure, excoriation), after the traumatic event. This can be differentiated from other lesions by arrangement, as Koebner phenomena may not follow dermatomes or the lines of Blaschko
- **morbilliform**: a maculopapular rash resembling measles
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: lesions scattered outside of primary lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. EM)
- **other descriptive terms**: discrete, clustered, linear, confluent, dermatitic, indurated

## Differential Diagnoses of Common Presentations

Table 2. Differential Diagnosis of Common Presenting Problems

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
<b>Brown Macule</b>		Post-inflammatory hyper-pigmentation	UV radiation, actinic/solar lentigo, freckle (ephelide)	Congenital: café-au-lait spots, congenital nevus, epidermal/junctional nevus Neoplasia: lentigo maligna, malignant melanoma, pigmented BCC Other: melasma/chloasma ("mask of pregnancy")
<b>Discrete Red Papule</b>	Folliculitis Furuncle Scabies	Acne vulgaris Lichen planus Rosacea Psoriasis Urticaria	Bites/stings	Vascular: hemangioma, pyogenic granuloma Other: dermatofibroma, miliaria rubra
<b>Red Scales</b>	Pityriasis rosea Secondary syphilis Tinea	Dermatitis (atopic, contact, nummular, seborrheic) Discoid lupus Lichen planus Psoriasis	Gold	Neoplastic: mycosis fungoides
<b>Vesicle</b>	Cat-Scratch disease Impetigo Viral: HSV, HZV, VZV, Molluscum, Coxsackie Scabies	Acute contact dermatitis Dyshidrotic eczema		Other: dermatitis herpetiformis, porphyria cutanea tarda
<b>Bulla</b>	Bullous impetigo	Acute dermatitis EM, SJS, TEN, SLE	Fixed drug eruption	Autoimmune: bullous pemphigoid, pemphigus vulgaris Other: dermatitis herpetiformis, porphyria cutanea tarda
<b>Pustule</b>	Candida Dermatophyte Impetigo Sepsis Varicella	Acne vulgaris Rosacea Dyshidrotic dermatitis Pustular folliculitis Pustular psoriasis	Acute generalized exanthematous pustulosis (usually secondary to drug reaction)	Other: hidradenitis suppurativa
<b>Oral Ulcer</b>	Aspergillosis CMV Coxsackie Cryptococcosis HSV/HZV HIV, TB, Syphilis	Allergic stomatitis EM/SJS/TEN Lichen planus Seronegative arthropathies, SLE Recurrent aphthous stomatitis Behçet's disease	Chemotherapy Radiation therapy	Autoimmune: pemphigus vulgaris Congenital: XXY Hematologic: sickle cell disease Neoplasia: BCC, SCC
<b>Skin Ulcer</b>	Plague Syphilis TB Tularemia	RA, SLE, vasculitis UC (pyoderma gangrenosum)		Autoimmune: necrobiosis lipoidica diabetorum (e.g. DM) Congenital: XXY Hematologic: sickle cell disease Neoplasia: SCC Vascular: arterial, neurotropic, pressure, venous, aphthous, leukoplakia, traumatic

## Common Skin Lesions

### Cysts

Table 3. Cysts

	Epidermal Cyst	Pilar Cyst (Trichilemmal)	Dermoid Cyst	Ganglion Cyst	Milium
<b>Clinical Presentation</b>	Round, yellow/flesh coloured, slow growing, mobile, firm, fluctuant, nodule or tumour	Multiple, hard, variable sized nodules under the scalp, lacks central punctum	Most commonly found at lateral third of eyebrow or midline under nose	Usually solitary, rubbery, translucent; a clear gelatinous viscous fluid may be extruded	1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead
<b>Pathophysiology</b>	Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic	Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma, often familial	Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick walled cyst filled with dense keratin	Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthritis	Small epidermoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures
<b>Epidemiology</b>	Most common cutaneous cyst in youth – mid age	2nd most common cutaneous cyst F>M	Rare	Older age	Any age 40-50% of infants
<b>Clinical Course</b>	Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Increase in size and number over time, especially in pregnancy	Rupture causes pain and inflammation	If nasal midline, risk of extension into CNS	Stable	In newborns, spontaneously resolves in first 4 wk of life
<b>Management</b>	Excise completely before it becomes infected	Excision	Excision	Drainage ± steroid injection if painful Compression daily for 6 wk Excision if bothersome	Incision and expression of contents Laser ablation and electrodesiccation Multiple facial milia respond to topical retinoid therapy

## Fibrous Lesions

### DERMATOFIBROMA

#### Clinical Presentation

- button-like, firm dermal papule or nodule, skin-coloured to red-brown colouring
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign: lateral compression causes dimpling of the lesion

#### Pathophysiology

- benign tumour due to fibroblast proliferation in the dermis

#### Etiology

- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibromata can be associated with SLE

#### Epidemiology

- adults, F>M

#### Differential Diagnosis

- dermatofibrosarcoma protuberans, malignant melanoma, Kaposi's sarcoma, blue nevus

#### Investigations

- biopsy if diagnosis is uncertain

#### Management

- no treatment required
- excision or cryosurgery if bothersome

### SKIN TAGS

#### Clinical Presentation

- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

#### Pathophysiology

- benign outgrowth of skin

#### Epidemiology

- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

#### Differential Diagnosis

- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC)

#### Management

- excision, electrodesiccation, cryosurgery

#### Skin tags are also known as...

- Acrochordons
- Fibroepithelial polyps
- Soft fibromas
- Pedunculated lipofibromas
- Cutaneous papillomas

## Hyperkeratotic Lesions

### SEBORRHEIC KERATOSIS

#### Clinical Presentation

- well-demarcated waxy papule/plaque with classic "stuck on" appearance
- large variety in colour, size and shape
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

#### Pathophysiology

- very common benign epithelial tumour

#### Epidemiology

- unusual <30 yr old
- autosomal dominant inheritance

#### Differential Diagnosis

- malignant melanoma (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented actinic keratosis

**Investigations**

- biopsy only if diagnosis uncertain

**Management**

- none required, for cosmetics only
- cryotherapy, curettage

**ACTINIC KERATOSIS (SOLAR KERATOSIS)****Clinical Presentation**

- ill-defined, scaly erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

**Pathophysiology**

- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of actinic keratosis (AK) to SCC (~1/1000), but higher likelihood if AK is persistent

**Epidemiology**

- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III (see sidebar, D3), rare in darker skin as melanin is protective

**Differential Diagnosis**

- SCC in situ, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

**Investigations**

- biopsy lesions that are refractory to treatment

**Management**

- destructive: cryotherapy, electrodesiccation and curettage
- pharmacotherapy: 5-fluorouracil cream for 2-3 wk, imiquimod cream for 8-10 wk, photodynamic therapy

**KERATOACANTHOMA****Clinical Presentation**

- rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled crater, resembling an erupting volcano
- often spontaneously regresses within a year, leaving a scar
- sites: sun-exposed skin

**Pathophysiology**

- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

**Etiology**

- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

**Epidemiology**

- >50 yr, rare <20 yr

**Differential Diagnosis**

- treat as SCC until proven otherwise
- hypertrophic solar keratosis, verruca vulgaris

**Management**

- surgical excision, treated similarly to SCC

**CORNS****Clinical Presentation**

- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

**Pathophysiology**

- localized hyperkeratosis induced by pressure on hands and feet

**Corns vs. Warts vs. Calluses**

- **Corns** have a whitish yellow central translucent keratinous core. Painful with direct pressure
- **Warts** bleed with paring and have a black speckled central appearance due to thrombosed capillaries. Plantar warts destroy dermatoglyphics (epidermal ridges)
- **Calluses** have layers of yellowish keratin revealed with paring. There are no thrombosed capillaries or interruption of epidermal ridges

### Epidemiology

- F>M, can be caused by chronic microtrauma

### Differential Diagnosis

- tinea pedis, plantar warts

### Management

- relieve pressure with padding or alternate footwear, orthotics
- paring, curettage

## Keloids

### Clinical Presentation

- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for years with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area

### Pathophysiology

- excessive deposition of randomly organized collagen fibers following trauma to skin
- differentiated from a hypertrophic scar which is confined to the borders of the original injury

### Epidemiology

- most common in black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

### Management

- intralesional corticosteroid injections
- cryotherapy
- silicone compression

#### Keloids vs. Hypertrophic Scars

- **Keloids:** extend beyond margins of original injury with claw-like extensions
- **Hypertrophic scars:** confined to original margins of injury

## Pigmented Lesions

Table 4. Comparison of Pigmented Lesions

	Ephelides (Freckles)	Solar Lentigo (Liver Spot)	Dermal Melanocytosis (historically known as Mongolian Spot)	Becker's Nevus
<b>Clinical Presentation</b>	Small (<5 mm) well-demarcated light brown macules Sites: sun-exposed skin	Well-demarcated brown/black irregular macules Sites: sun-exposed skin	Congenital grey-blue solitary or grouped macules commonly on lumbosacral area	Hairy, light brown macule/patch with a papular verrucous surface Sites: trunk and shoulders, onset in teen years
<b>Pathophysiology</b>	Increased melanin within basal layer keratinocytes secondary to sun exposure	Benign melanocytic proliferation in dermal-epidermal junction due to chronic sun exposure	Ectopic melanocytes in dermis	Pigmented hamartoma with increased melanin in basal cells
<b>Epidemiology</b>	Skin phototypes I and II	Most common in Caucasians >40 yr Skin phototype I-III	99% occurs in Asian and Aboriginal infants	M>F Often becomes noticeable at puberty
<b>Differential Diagnosis</b>	Junctional nevi Juvenile lentiginos	Lentigo maligna, seborrheic keratosis, pigmented solar keratosis	Ecchymosis	Hairy congenital melanocytic nevus
<b>Clinical Course and Management</b>	No treatment required Multiply and darken with sun exposure, fade in winter Sunscreen may prevent the appearance of new freckles	Laser therapy, shave excisions, cryotherapy	Usually fades in early childhood but may persist into adulthood	Hair growth follows onset of pigmentation Cosmetic management (usually too large to remove)

#### DDx of Hyperpigmented Macules

- Purpura (e.g. solar, ASA, anti-coagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

**NEVOMELANOCYTIC NEVI (NMN)** (see Table 5)

- common mole
- be suspicious of new or changing pigmented lesions (signs of melanoma)
- average number of moles per person: 18-40
- 3 stages of evolution:
  - junctional NMN: macular; arise at dermal-epidermal junction
  - compound NMN: papular; nevus cells invade the papillary dermis
  - dermal NMN: skin coloured papules (no longer hyperpigmented); nevus cells completely migrate into dermis

**Table 5. Nevomelanocytic Nevus Classification**

Type	Age of Onset	Clinical Presentation	Histology	Management
<b>Congenital</b>	Birth and early infancy	Sharply demarcated pigmented brown plaque with regular/irregular contours ± coarse hairs Consider meningeal involvement if very large or bathing suit distribution	Nevomelanocytes in epidermis (clusters) and dermis (strands)	Surgical excision if suspicious, due to increased risk of melanoma
<b>Acquired</b>	Early childhood to age 40 Involute by age 60	Benign neoplasm of pigment-forming nevus cell Well circumscribed, round, uniformly pigmented macules/papules <1.5 cm Classified according to site of nevus cells		Excisional biopsy can be considered if on scalp, soles, mucous membranes, anogenital area, or if varied colours, irregular borders, pruritic, bleeding, exposed to trauma
<b>Junctional</b>	Childhood Majority progress to compound nevus	Flat, irregularly bordered, uniformly tan-dark brown, sharply demarcated smooth macule	Melanocytes at dermal-epidermal junction above basement membrane	Same as above
<b>Compound</b>	Any age	Domed, regularly bordered, smooth, round, tan-dark brown papule Face, trunk, extremities, scalp NOT found on palms or soles	Melanocytes at dermal-epidermal junction; migration into dermis	Same as above
<b>Dermal</b>	Adults	Soft, dome-shaped, skin-coloured to tan/brown papules or nodules, often with telangiectasia Sites: face, neck	Melanocytes exclusively in dermis	Same as above
<b>Dysplastic</b>	Childhood	Variegated macule/papule with irregular indistinct melanocytes in the basal cell layer Risk factors: positive family history	Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus Often with region of adjacent nests	Follow with colour photographs for changes Excisional biopsy if lesion changing or highly atypical

**ABCDE of Melanoma**

**A**symmetry  
**B**orders (irregular)  
**C**olour (variegated)  
**D**iameter (>6 mm)  
**E**volution (over time)

**Other Nevi**

- **Halo nevus:** often a typical appearing nevus surround by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- **Blue nevus:** round to oval macule/papule with homogenous blue to blue-black colour. Often appears in childhood and late adolescence; no treatment required unless atypical features are noted

**MELASMA****Clinical Presentation**

- dark skin discoloration on sun-exposed areas of face (forehead, upper lip, cheeks, chin)
- usually symmetrical

**Pathophysiology**

- increase in number and activity of melanocytes
- associated with estrogen and progesterone
- classification determined by depth of hyperpigmentation in the skin (epidermal, dermal, mixed type)
- epidermal pigmentation is most common and can be diagnosed with Wood's light

**Epidemiology**

- F>>M
- common in pregnancy (chloasma = "mask of pregnancy") and women taking OCP and HRT
- risk factors include sun exposure and dark skin tone
- can occur with mild endocrine disturbances, antiepileptic medications and other photosensitizing drugs

### Management

- bleaching cream (hydroquinone), retinoic acid, topical steroids or combination creams
- destructive modalities (chemical peels, laser treatment)
- camouflage make-up
- avoiding sun and using sunscreen are key to preventing melasma
- often fades over several months after stopping hormone treatment or delivering baby

## Vascular Lesions

**Table 6. Vascular Tumours Compared to Vascular Malformations**

	Vascular Tumours	Vascular Malformations
<b>Definition</b>	Endothelial hyperplasia	Congenital malformation with normal endothelial turnover
<b>Presence at Birth</b>	Usually postnatal	100% at birth (not always obvious)
<b>M:F</b>	1:3-5	1:1
<b>Natural History</b>	Phases: <ul style="list-style-type: none"> <li>• Proliferating</li> <li>• Involuting</li> <li>• Involved</li> </ul>	Proportionate growth (can expand)

### HEMANGIOMAS

#### Clinical Presentation

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a “bag of worms” when palpated

#### Pathophysiology

- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

**Table 7. Vascular Tumours**

	Capillary Hemangioma	Spider Angioma (Campbell telangiectasia)	Cherry Angioma (Campbell De Morgan spot)	Pyogenic Granuloma
<b>Clinical Presentation</b>	Hot, firm red to blue plaques or tumours	Central red arteriole with slender branches, faintly pulsatile, blanchable Sites: face, forearms, and hands	Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm Site: trunk Less friable compared to pyogenic granulomas	Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes DDx: glomus tumour, nodular malignant melanoma, SCC, nodular BCC
<b>Pathophysiology</b>	Benign vascular proliferation of endothelial lining	Associated with hyperestrogenic state (e.g. in hepatocellular disease, pregnancy, OCP)	Benign vascular neoplasm	Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia
<b>Epidemiology</b>	Appears shortly after birth; rarely may be congenital		>30 yr old	<30 yr old
<b>Clinical Course</b>	Appears shortly after birth, increases in size over months, then regresses 50% of lesions resolve spontaneously by 5 yr	Increase in number over time	Lesions do not fade in time Lesions bleed infrequently	
<b>Management</b>	10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis Consider treatment if not gone by school age; Propranolol; systemic corticosteroids; laser treatment; surgery	Electro or laser surgery Systemic corticosteroids and IFN- $\alpha$ may be indicated for rapidly growing lesions	Usually no treatment needed Laser or electrocautery for small lesions Excision of large lesions if necessary	Surgical excision with histologic examination Electrocautery; laser; cryotherapy

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion.

Pyogenic Granuloma is a misnomer: it is neither pyogenic nor granulomatous.

## VASCULAR MALFORMATIONS

### 1. Nevus Flammeus (Port-wine stain)

#### Clinical Presentation

- red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline
- most common site: nape of neck

#### Pathophysiology

- congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)

#### Management

- laser or make-up

### 2. Nevus Simplex (salmon patch)

#### Clinical Presentation

- pink-red irregular patches
- midline macule on glabella known as “Angel Kiss”; on nuchal region known as “Stork Bites”
- present in 1/3 of newborns
- majority regress spontaneously

#### Pathophysiology

- congenital dilation of dermal capillaries

#### Management

- no treatment required

## Acneiform Eruptions

### Acne Vulgaris/Common Acne

#### Clinical Presentation

- a common inflammatory pilosebaceous disease categorized with respect to severity
  - Type I: comedonal, sparse, no scarring
  - Type II: comedonal, papular, moderate  $\pm$  little scarring
  - Type III: comedonal, papular, and pustular, with scarring
  - Type IV: nodulocystic acne, risk of severe scarring
- sites of predilection: face, neck, upper chest, and back

#### Pathogenesis

- hyperkeratinization, at the follicular ostia (opening), blocks the secretion of sebum (microcomedones)
- androgens stimulate sebaceous glands to produce sebum
- anaerobic diphtheroid *Propionibacterium acnes* bacteria contains lipase, which converts sebum to free fatty acids and produces pro-inflammatory mediators

#### Epidemiology

- age of onset in puberty (10-17 yr in females, 14-19 yr in males)
- in prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- more severe in males than in females
- incidence decreases in adulthood
- genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

#### Differential Diagnosis

- folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

#### Management

- see Table 8

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone.

#### Intralesional Injections

Intralesional corticosteroid injections are effective in the treatment of individual acne nodules.

#### Acne Myths Debunked

- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

#### Acne Exacerbating Factors

- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

Table 8. Management of Acne

Drug Name	Mechanism of Action	Notes
<b>MILD ACNE: Topical Therapies Over-the-Counter</b>		
<b>Benzoyl peroxide</b>	Bactericidal agent (targets <i>P. acnes</i> ) and comedolytic	Helps prevent <i>P. acnes</i> resistance
<b>Salicylic acid</b>	Comedolytic	Used when patients cannot tolerate a topical retinoid due to skin irritation
<b>MILD ACNE: Prescription Topical Therapies</b>		
<b>Clindamycin phosphate (e.g. Dalacin T<sup>®</sup>)</b>	Lincosamide antibiotic; inhibits protein synthesis	High rate of resistance when used as monotherapy
<b>Erythromycin</b>	Macrolide antibiotic; inhibits protein synthesis	High rate of resistance when used as monotherapy
<b>BenzaClin<sup>®</sup> gel</b>	1% clindamycin and 5% benzoyl peroxide	See above
<b>Erythromycin + benzoyl peroxide (Benzamycin<sup>®</sup>)</b>	3% erythromycin and 5% benzoyl peroxide	See above
<b>Adapalene (e.g. Differin<sup>®</sup>)</b>	Comedolytic	Less irritating than tretinoin. Not photolabile
<b>Tretinoin (e.g. Retin-A<sup>®</sup>)</b>	Comedolytic	Photolabile and irritation
<b>Adapalene + benzoyl peroxide (e.g. Tactuo<sup>®</sup>)</b>	0.1% adapalene and 2.5% benzoyl peroxide	See above
<b>MODERATE ACNE:</b> After topical treatments have failed, add oral antibiotics, such as tetracycline (250 mg PO bid to 500 mg bid), or erythromycin (500 mg PO bid). Antibiotics require 3-6 mo of use before assessing efficacy. Consider hormonal therapy, including antiandrogens		
<b>Tetracycline</b>	Inhibits protein synthesis	Use caution with regard to drug interactions: do not use with isotretinoin. Sun sensitivity
<b>Cyproterone acetate-ethinyl estradiol (Diane-35<sup>®</sup>)</b>	Cyproterone: potent anti-androgenic, progestogenic and antigonadotrophic activity Ethinyl estradiol: increases level of SHBG, reducing circulating plasma levels of androgens	After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance
<b>Spironolactone (source ADA)</b>	Blocks androgen receptors Dosages of 50 mg to 200 mg have been shown to be effective in hormonal acne	May cause hyperkalemia at higher doses Black box warning for breast cancer
<b>SEVERE ACNE:</b> Consider systemic retinoids after above treatments have failed or if significant scarring present		
<b>Isotretinoin (Accutane<sup>®</sup>, Clarus<sup>®</sup>)</b>	Retinoid that inhibits sebaceous gland function and regulates keratinization	See Table 29, D46 for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and $\beta$ -hCG before treatment May transiently exacerbate acne before patient sees improvement Drug may be discontinued at 16-20 wk when nodule count has dropped by >70% A second course may be initiated after 2 mo pm Refractory cases may require multiple courses of isotretinoin

**Accutane and Pregnancy**

- Use of Accutane<sup>®</sup> during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting Accutane<sup>®</sup>
- Ideally, patients should use 2 forms of contraception while on Accutane<sup>®</sup>

**Treatment of Acne Scars**

- Tretinoin creams
- Microdermabrasion for superficial scars
- Injectable fillers (collagen, hyaluronic acid)
- Fraxel laser

**Important Controversies Associated with Isotretinoin Therapy for Acne**

*Am J Clin Dermatol* 2013;14:71-76

**Study:** Review on isotretinoin and (1) depression and suicide, (2) inflammatory bowel disease (IBD), (3) pregnancy prevention programs.

**Conclusions:**

1. The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin.
2. There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo).

## Perioral Dermatitis

### Clinical Presentation

- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips
- aggravated by topical glucocorticoids

### Epidemiology

- 15-40 yr old, occasionally in younger children
- predominantly females

### Differential Diagnosis

- contact dermatitis, rosacea, acne vulgaris

## Management

- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)

## Rosacea

### Clinical Presentation

- dome-shaped papules ± pustules
- flushing, non-transient erythema and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks and chin (see Figure 3); rarely on scalp, neck and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, caffeine, spices (triggers of vasodilation)
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharoconjunctivitis, keratitis, iritis

### Pathophysiology

- unknown

### Epidemiology

- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

### Differential Diagnosis

- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

### Management

- trigger avoidance is key to long term management
- avoid topical corticosteroids
- make-up to mask erythema
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy (CO<sub>2</sub>, argon, Nd:YAG)
- early diagnosis and prompt treatment are recommended to prevent worsening

Table 9. Specific Rosacea Treatments

1st Line	2nd Line	3rd Line
Oral tetracyclines (250-500 mg PO bid)	Topical clindamycin	Oral retinoids
Topical metronidazole	Topical erythromycin 2% solution	Topical sulfur
Oral erythromycin (250-500 mg PO bid)	Topical benzoyl peroxide	
Topical azelaic acid	Oral metronidazole	
	Ampicillin	

## Dermatitis (Eczema)

### Definition

- inflammation of the skin

### Clinical Presentation

- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting
- chronic dermatitis: lichenification, xerosis, fissuring

Figure 3. Rosacea distribution

Rosacea can be differentiated from acne by the absence of comedones, a predilection for the central face and symptoms of flushing.

### Guidelines for the Diagnosis of Rosacea

*J Am Acad Dermatol* 2002;46:584-7

Presence of one or more of the following primary features:

- Flushing (transient erythema)
- Nontransient erythema
- Papules and pustules
- Telangiectasia

May include one or more of the following secondary features:

- Burning or stinging
- Dry appearance
- Edema
- Phymatous changes
- Ocular manifestations
- Peripheral location

### Subtypes and Variants of Rosacea and Their Characteristics

N.B. the subtypes can all coexist and can be seen on a spectrum of severity

#### SUBTYPE

- **Erythromatotelangiectatic**
  - Flushing, persistent central facial erythema ± telangiectasia
- **Papulopustular**
  - Persistent central facial erythema
  - Transient central facial papules or pustules or both
- **Phymatous**
  - Thickening skin, irregular surface nodularities and enlargement
  - Nose most commonly, rarely occurs elsewhere (chin, forehead, cheeks or ears)
- **Ocular**
  - Foreign body sensation in the eye, burning or stinging, dryness, itching, ocular photosensitivity, blurred vision, telangiectasia of the sclera or other parts of the eye, or periorbital edema

#### VARIANT

- **Granulomatous**
  - Noninflammatory, hard, brown, yellow, or red cutaneous papules or nodules of uniform size

## Asteatotic Dermatitis

### Clinical Presentation

- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (aka “winter itch”) but starts in the fall
- shins predominate, looks like a “dried river bed”

### Management

- skin rehydration with moisturizing routine
- ± mild corticosteroid creams

## Atopic Dermatitis

### Clinical Presentation

- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution
  - infant (onset at 2-6 mo old): face, scalp, extensor surfaces
  - childhood (>18 mo): flexural surfaces, especially antecubital fossae, popliteal fossae, and neck
  - adult: hands, feet, flexures, wrists, face, forehead, eyelids, neck
- inflammation, lichenification, excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with
  - keratosis pilaris (hyperkeratosis of hair follicles, “chicken skin”)
  - xerosis
  - occupational hand dryness

### Epidemiology

- frequently affects infants, children, and young adults
- almost 15% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever, anaphylaxis, eosinophilia)
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- childhood onset and hereditary forms may be associated with null mutations in the protein filaggrin
- the earlier the onset, the more severe and persistent the disease
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

### Pathophysiology

- a T-cell driven process with epidermal barrier dysfunction

### Investigations

- clinical diagnosis
- consider: skin biopsy, immunoglobulin serum levels (often elevated serum IgE level), patch testing, and skin prick tests

### Management

- goal: reduce signs and symptoms, prevent or reduce recurrences/flare
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early and treatment plan individualized
- avoid triggers of AD
- **enhance barrier function of the skin**
  - regular application of moisturizers
  - emollients hydrate the skin and reduce pruritus
  - twice daily application is recommended even in absence of symptoms, especially after bathing or swimming
  - bathing promotes hydration when followed by the application of moisturizers to the skin followed by occlusives (e.g. petroleum jelly)
- **anti-inflammatory therapies**
  - topical corticosteroids
    - effective, rapid symptomatic relief of acute flares
    - best applied immediately after bathing
    - control inflammation with a potent topical steroid; a milder one following resolution of acute flare
    - systemic immunosuppression may be needed in severe cases
    - flares may respond to systemic anti-staphylococcal therapy
    - side effects: skin atrophy, purpura, striae, steroid acne, perioral dermatitis, and glaucoma when used around the eyes

**Figure 4. Atopic dermatitis distribution**

#### Triggers for Atopic Dermatitis

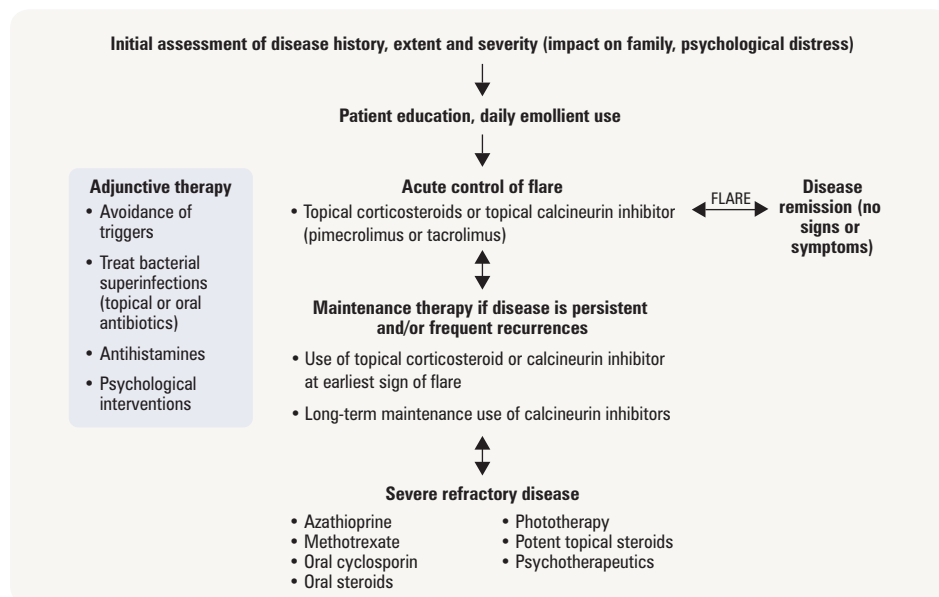

- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (dust mites)
- Inappropriate bathing habits (long hot showers)
- Sweating
- Microbes (*S. aureus*)
- Stress

**B. topical immunomodulators**

- long-term management
- calcineurin inhibitors include pimecrolimus (Elidel®), tacrolimus (Protopic®)
- side effects: skin burning, transient irritation
- advantages of immunomodulators over long-term corticosteroid use
  - ♦ rapid, sustained effect in controlling pruritus
  - ♦ no skin atrophy
  - ♦ safe for the face and neck

**Complications**

- infections
  - treatment of infections
    - ♦ topical mupirocin or fusidic acid (Canada only, not available in US)
    - ♦ oral antibiotics (e.g. cloxacillin, cephalexin) for widespread *S. aureus* infections

**Figure 5. Atopic dermatitis treatment algorithm**

Adapted from: Ellis C, et al. ICCAD II Faculty. International Consensus Conference on Atopic Dermatitis II (ICCAD II): clinical update and current treatment strategies. *Br J Dermatol* 2003;148(Suppl 63):3-10

**The Diagnostic Value of Atopy Patch Testing and Prick Testing in Atopic Dermatitis: Facts and Controversies**

*Clin Dermatol* 2010;28:38-44

**Study:** Systematic review.

**Conclusions:**

Use of the atopy patch test (APT) is controversial:

- There is no gold standard for aeroallergen provocation, so APT is used without comparison to another method.
- APT findings are not consistent among children with atopic dermatitis.

APT may be valuable:

- May provide diagnostic information and may aid clinical decision making regarding the use of IGE-mediated sensitizations

Future research is needed:

- Need standardized provocation and avoidance testing to determine the clinical relevance of obtaining a positive APT result

**Top Ten Allergens as Identified by The North American Contact Dermatitis Group**

Test Substance	Allergic Reactions (%)	Common Uses
Nickel sulfate	14.2	Found in some jewelry, belt buckles
Neomycin sulfate	13.1	Most commonly used topical antibiotic
Balsam of Peru	11.8	Fragrance material
Fragrance mix	11.7	A mix of eight different fragrance components which was developed to allow for allergen testing in cosmetics
Thimerosal	10.9	A common preservative that is used in vaccines, contact lens solution, cosmetics
Sodium gold	9.5	Used in jewellery, dentistry, thiosulfate electronics
Formaldehyde	9.3	A colourless gas found in many workplaces, cosmetics, medications, textiles, resins, plastic bottles
Quaternium-15	9.0	A component in many shampoos, moisturizers, conditioners and soaps
Cobalt chloride	9.0	A hard metal found in cosmetics, jewellery, buttons, tools
Bacitracin	8.7	A topical antibiotic – one of the main ingredients in Polysporin®

## Contact Dermatitis

**Clinical Presentation**

- cutaneous inflammation caused by an external agent(s)

**Table 10. Contact Dermatitis**

	Irritant Contact Dermatitis	Allergic Contact Dermatitis
<b>Mechanism of Reaction</b>	Toxic injury to skin; non-immune mechanism	Cell-mediated delayed (Type IV) hypersensitivity reaction (see <a href="#">Rheumatology</a> , RH2)
<b>Type of Reaction</b>	Erythema, dryness, fine scale, burning Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure) Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common	Erythema with a papulovesicular eruption, swelling, pruritus
<b>Frequency of Contact Dermatitis</b>	Majority; will occur in anyone given sufficient concentration of irritants	Minority; patient acquires susceptibility to allergen that persists indefinitely
<b>Distribution</b>	Palmar surface of hand usually involved	Dorsum of hand usually involved; often discrete area of skin involvement
<b>Examples</b>	Soaps, weak alkali, detergents, organic solvents, alcohol, oils	(See sidebar) Many allergens are irritants, so may coincide with irritant dermatitis
<b>Management</b>	Avoidance of irritants Wet compresses with Burow's solution Barrier moisturizers Topical/oral steroids	Patch testing to determine specific allergen Avoid allergen and its cross-reactants Wet compresses soaked in Burow's solution (drying agent) Steroid cream (e.g. hydrocortisone 1%, betamethasone valerate 0.05% or 0.1% cream; bid) Systemic steroids pm (prednisone 1 mg/kg, taper over 2 wk)

## Dyshidrotic Dermatitis

### Clinical Presentation

- “tapioca pudding” papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infection common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

### Pathophysiology

- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate the dermatitis

### Management

- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic:
  - prednisone in severe cases
  - antibiotics for secondary *S. aureus* infection

## Nummular Dermatitis

### Clinical Presentation

- annular, coin-shaped, pruritic, dry, scaly, erythematous plaques, can become lichenified
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

### Management

- moisturization
- mid to high potency corticosteroid ointment bid

## Seborrheic Dermatitis

### Clinical Presentation

- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: cause of “cradle cap”
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

### Pathophysiology

- possible etiologic association with *Malassezia* spp. (yeast)

### Epidemiology

- common in infants and at puberty
- increased incidence and severity in immunocompromised patients (e.g. HIV)
- in adults, can cause dandruff (pityriasis sicca)

### Management

- face: ketoconazole (Nizoral®) cream daily or bid + mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoother FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Stieprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)

## Stasis Dermatitis

### Clinical Presentation

- persistent inflammation of the lower legs with erythema, xerosis, scaling, and brownish pigmentation in late stages
- associated with venous insufficiency

### Management

- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

### Complications

- ulceration (common at medial malleolus), secondary bacterial infections

## Lichen Simplex Chronicus

### Clinical Presentation

- chronic dermatitis resulting from continued rubbing/scratching of skin → lichenified skin
- may develop secondarily to another pruritic skin disease

### Management

- treat pruritus to break the itch-scratch cycle: antihistamines, topical antipruritics
- topical high-potency corticosteroids

## Papulosquamous Diseases

### Lichen Planus

#### Clinical Presentation

- acute or chronic inflammation of mucous membranes or skin characterized by violaceous papules, especially on flexural surfaces
- small, polygonal, flat-topped, shiny, violet papules; resolves into hyperpigmented macules
- sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis
- spontaneously resolves but may last for weeks, months or years (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon
- may be triggered by severe emotional stress

#### Management

- topical corticosteroids with occlusion or intradermal steroid injections
- short courses of oral prednisone (rarely)
- photochemotherapy for generalized or resistant cases
- oral retinoids for erosive lichen planus in mouth
- systemic immunosuppression/modulation e.g. azathioprine, methotrexate, cyclosporine, metronidazole

#### The 6 Ps of Lichen Planus

Purple  
Pruritic  
Polygonal  
Peripheral  
Papules  
Penis (i.e. mucosa)

### Pityriasis Rosea

#### Clinical Presentation

- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (aka Langer's Lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- sites: trunk, proximal aspects of arms and legs

## Etiology

- suspected HHV7

## Management

- none required; clears spontaneously in 6-12 wk, reassurance
- topical corticosteroids when post-inflammatory pigmentation is a concern or if patient is uncomfortable
- oral erythromycin or oral acyclovir may expedite healing

# Psoriasis

## Classification

1. plaque psoriasis
2. guttate psoriasis
3. erythrodermic psoriasis
4. pustular psoriasis
5. psoriatic arthritis

## Differential Diagnosis

- atopic dermatitis, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea

## Diagnosis

- usually clinical, biopsy to confirm
- psoriasis area and severity index (PASI)
  - score is based on: percentage of surface area involved and the severity of symptoms (erythema, infiltration, desquamation)

## 1. PLAQUE PSORIASIS

### Clinical Presentation

- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun and humidity)
- Koebner phenomenon
- Auspitz sign: bleeds from minute points when scale is removed
- usually non-pruritic
- exacerbating factors: drugs (lithium, ethanol, chloroquine,  $\beta$ -blockers), stress
- sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

### Pathophysiology

- decreased epidermal transit time from stratum basale to stratum corneum
- shortened cell cycle of psoriatic compared to normal skin
- Th1-mediated inflammatory response

### Management

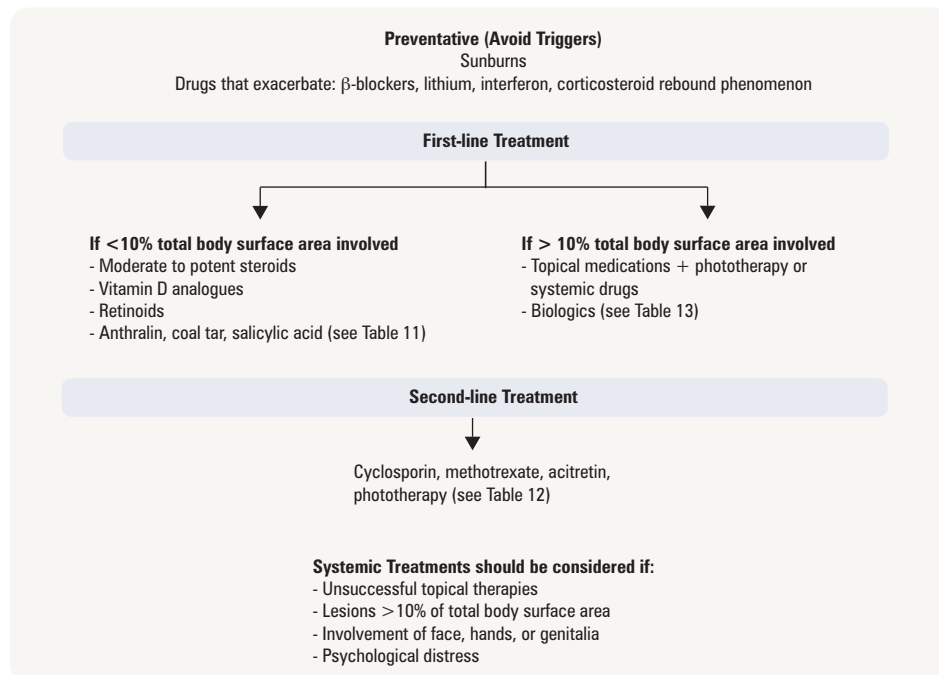

Figure 6. Management of plaque psoriasis

### PSORIASIS: Presentation and Pathophysiology

Pink papules/Plaques/Pinpoint bleeding (Auspitz sign)/Physical injury (Koebner phenomenon)  
 Silver scale/Sharp margins  
 Onycholysis/Oil spots  
 Rete Ridges with Regular elongation  
 Itching  
 Arthritis/Abscess (Munro)/Autoimmune  
 Stratum corneum with nuclei  
 Immunologic  
 Stratum granulosum absent

### PSORIASIS: Triggers

- Physical trauma (Koebner phenomenon)
- Infections (acute streptococcal infection precipitates guttate psoriasis)
- Stress (can be a major factor in flares)
- Drugs (systemic glucocorticoids, oral lithium, antimalarial drugs, interferon)
- Alcohol ingestion

**Table 11. Topical Treatment of Psoriasis**

Treatment	Mechanism	Comments
Lubricants	Reduce fissure formation	Petrolatum is effective
Salicylic acid 1-12%	Remove scales	
Tar (LCD: Liquor carbonis detergens) 20% coal tar solution	Inhibits DNA synthesis, increases cell turnover	Poor long term compliance
Calcipotriene /calitriol (Dovonex <sup>®</sup> , Vectical <sup>®</sup> )	Binds to skin 1,25-dihydroxyvitamin D3 to inhibit keratinocyte proliferation	Can be used on face and skin folds
Betamethasone + calcipotriene (Dovobet <sup>®</sup> , Taclonex <sup>®</sup> )	See above	Sold as Dovobet <sup>®</sup> in Canada and Europe, sold as Taclonex <sup>®</sup> in US
Corticosteroid ointment	Reduce scaling and thickness	Use appropriate potency steroid in different areas for degree of psoriasis
Tazarotene (Tazorac <sup>®</sup> ) (gel/cream)	Retinoid derivative, decreased scaling	Use on nails

**Table 12. Systemic Treatment of Psoriasis**

Treatment	Adverse Effects
Methotrexate	Bone marrow toxicity, hepatic cirrhosis
PUVA	Pruritus, burning, cataracts, skin cancer
Acitretin	Alopecia, cheilitis, teratogenicity, epistaxis, xerosis, hypertriglyceridemia
Cyclosporine	Renal toxicity, hypertension, immunosuppression
UVB and "Narrow band" UVB (311-312 nm)	Well tolerated

**Table 13. Biologics Approved in Canada**

Treatment	Route	Dosing Schedule	Effectiveness	Action
etanercept (Enbrel <sup>®</sup> )*	SC	Twice weekly initially	+++	Anti-TNF
adalimumab (Humira <sup>®</sup> )*	SC	Once every 2 wk	++++	Anti-TNF
infliximab (Remicade <sup>®</sup> )*	IV	~Every 2 mo	+++++	Anti-TNF
ustekinumab (Stelara <sup>®</sup> )	SC	Every 12 wk during maintenance	++++	Anti-IL 12/23

\*Can also be used to treat psoriatic arthritis

## 2. GUTTATE PSORIASIS ("DROP-LIKE")

### Clinical Presentation

- discrete, scattered salmon-pink scaling papules
- sites: generalized, sparing palms and soles
- often antecedent streptococcal pharyngitis

### Management

- UVB phototherapy, sunlight, lubricants
- penicillin V or erythromycin if Group A  $\beta$ -hemolytic Streptococcus on throat culture

## 3. ERYTHRODERMIC PSORIASIS

### Clinical Presentation

- generalized erythema with fine desquamative scale on surface
- associated symptoms: arthralgia, severe pruritus
- may present in patient with previous mild plaque psoriasis
- aggravating factors: lithium,  $\beta$ -blockers, NSAIDs, antimalarials, phototoxic reaction, infection

### Management

- hospitalization, bed rest, IV fluids, monitor fluid and electrolytes
- treat underlying aggravating condition, sun avoidance
- methotrexate, cyclosporine, UV, oral retinoids, biologics

#### Topical Treatments for Chronic Plaque Psoriasis

Cochrane DB Syst Rev 2009;2:CD005028

**Study:** Systematic review of randomized trials comparing treatments against placebo or against vitamin D.

**Patients:** 21,448 patients with chronic plaque psoriasis.

**Intervention:** Corticosteroids, dithranol, tarazotene, salicylic acid, retinoids, methotrexate, macrolactams, vitamin D, and vitamin D + corticosteroids.

**Outcome:** Investigator assessment of overall global improvement. Total severity scores. Psoriasis area and severity index. Patient assessment of overall global improvement.

**Results:** Corticosteroids, vitamin D, dithranol, and tazarotene performed better than placebo alone. A combination of corticosteroids and vitamin D were better than either vitamin D or corticosteroids alone.

#### Calcipotriol is a vitamin D derivative

**Dovobet<sup>®</sup>** = calcipotriene combined with betamethasone dipropionate and is considered to be the most potent topical psoriatic therapy.

#### Efficacy and Tolerability of Biologic and Nonbiologic Systemic Treatments for Moderate-to-Severe Psoriasis: Meta-analysis of randomized Controlled Trials

Br J Derm 2008;159:513-526

**Study:** Meta-analysis of 16 double-blind placebo-controlled trials.

**Patients:** Patients with moderate to severe psoriasis (PASI cutoff of 7).

**Intervention:** Treatment with fumaric acid ester, cyclosporine, infliximab, etanercept, efalizumab, or adalimumab vs. placebo.

**Main Outcome:** Proportion of study subjects with at least a 75% reduction in PASI score.

**Results:** The highest efficacy was observed with biologics, infliximab (Risk Difference (RD) = 77%), followed by Adalimumab (RD = 64%). No conclusions could be made about long-term safety of biologic treatments.

#### Mechanism of Biologics

"-mab" = monoclonal antibody  
"-cept" = receptor

#### 4. PUSTULAR PSORIASIS

##### Clinical Presentation

- sudden onset of erythematous macules and papules which evolve rapidly into pustules, very painful
- can be generalized or localized to palms/soles
- patient usually has history of psoriasis; may occur with sudden withdrawal from steroid therapy

##### Management

- methotrexate, oral retinoids, biologics

#### 5. PSORIATIC ARTHRITIS

- 5 categories
  - asymmetric oligoarthritis
  - DIP joint involvement (predominant)
  - rheumatoid pattern (symmetric polyarthropathy)
  - psoriatic arthritis mutilans (most severe form)
  - predominant spondylitis or sacroiliitis
- see [Rheumatology](#), RH23

## Vesiculobullous Diseases

### Bullous Pemphigoid

##### Clinical Presentation

- chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth (33%)

##### Pathophysiology

- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

##### Epidemiology

- 60-80 yr old
- there are case reports of association with internal malignancy, but this is exceedingly rare

##### Investigations

- immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

##### Prognosis

- generalized bullous eruption heals without scarring
- rarely fatal

##### Management

- prednisone ± steroid-sparing agents (e.g. azathioprine, methotrexate)
- topical potent steroids (clobetasol) may be as effective as systemic steroids
- tetracycline ± nicotinamide is effective for some cases
- dapsone for milder cases

##### Pemphigus Vulgaris vs. Bullous Pemphigoid

Vulgaris = Superficial, intraepidermal, flaccid lesions  
Pemphigoid = Deeper, tense lesions at the dermal-epidermal junction

### Pemphigus Vulgaris

##### Clinical Presentation

- autoimmune blistering disease characterized by flaccid, non-pruritic epidermal bullae/vesicles on an erythematous or normal skin base
- may present with erosions and secondary bacterial infection
- sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
- Nikolsky's sign: sliding or rubbing pressure on skin → separation of epidermis
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

##### Pathophysiology

- IgG produced against epidermal desmoglein-1 and -3 leads to intraepidermal bullae

##### Epidemiology

- 40-60 yr old, higher prevalence in Jewish, Mediterranean, Asian populations
- paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

##### Pemphigus Foliaceus

An autoimmune intraepidermal blistering disease that is more superficial than pemphigus vulgaris due to antibodies against desmoglein-1, a transmembrane adhesion molecule. Appears as crusted patches and erosions which can initially be managed with topical steroids if localized. Active widespread disease is treated like pemphigus vulgaris.

### Investigations

- immunofluorescence: shows IgG and C3 deposition intraepidermally
- circulating serum anti-desmoglein IgG antibodies

### Prognosis and Clinical Course

- begins with mouth lesions, followed by skin lesions
- first localized (6-12 mo) then generalized
- lesions heal with hyperpigmentation but no scar
- may be fatal unless treated with immunosuppressive agents

### Management

- prednisone 1-3 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper
- steroid-sparing agents: azathioprine, methotrexate, gold, cyclophosphamide, cyclosporine, intravenous immunoglobulin (IVIG), mycophenolate mofetil, rituximab
- plasmapheresis for acutely high antibody levels

#### Azathioprine

Thiopurine methyltransferase (TPMT) levels should be measured before starting therapy. Individuals with low enzyme activity will experience greater immunosuppression.

**Table 14. Summary of Vesiculobullous Diseases**

	<b>Bullous Pemphigoid</b>	<b>Dermatitis Herpetiformis</b>	<b>Pemphigus Vulgaris</b>
<b>Antibody</b>	IgG	IgA	IgG
<b>Site</b>	Basement membrane	Dermal	Intraepidermal
<b>Infiltrate</b>	Eosinophils	Neutrophils	Eosinophils and neutrophils
<b>Management</b>	Systemic steroids Immunosuppressive agents Tetracycline Clobetasol cream	Gluten-free diet Dapsone	High dose steroids Immunosuppressive agent (e.g. Imuran®, mycophenolic acid)
<b>Association</b>	Malignancy (rarely)	Gluten enteropathy Thyroid disease Intestinal lymphoma	Malignancy with paraneoplastic pemphigus

## Dermatitis Herpetiformis

### Clinical Presentation

- grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging
- almost always excoriated, rarely seen as blisters
- lesions grouped, bilaterally symmetrical
- sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

### Pathophysiology

- 90% have HLA B8, DR3, DQWZ
- 90% associated with an often subclinical gluten-sensitive enteropathy (celiac)
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

### Epidemiology

- 20-60 yr old, M:F = 2:1

### Management

- dapsone for pruritus
- gluten-free diet for life

## Porphyria Cutanea Tarda

### Clinical Presentation

- tense vesicles/bullae in photoexposed areas subjected to trauma
- facial hypertrichosis, brown hypermelanosis vesicles, and bullae in photodistribution (dorsum of hands and feet)
- sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

### Pathophysiology

- autosomal dominant or sporadic skin disorder associated with the presence of excess heme precursors
- associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

### Epidemiology

- 30-40 yr old, M>F

### Investigations

- urine + 5% HCl shows orange-red fluorescence under Wood's lamp (UV rays)
- 24 hour urine for uroporphyrins (elevated)
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

### Management

- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

## Drug Eruptions

### Drug Hypersensitivity Syndrome

- fever followed by symmetrical bright red exanthematous eruption that may lead to internal organ involvement (hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- classically occurs approximately 7-10 d after first exposure to the drug
- may be elevated incidence of similar reactions in siblings
- most common causes: sulfonamides, allopurinol, and anticonvulsants (phenytoin, phenobarbital, carbamazepine, lamotrigine)
- 10% mortality if severe, undiagnosed, and untreated

#### Drug Hypersensitivity Syndrome Triad

- Fever
- Exanthematous Eruption
- Internal Organ Involvement

### Erythema Multiforme (EM), Stevens-Johnson Syndrome (SJS), Toxic Epidermal Necrolysis (TEN)

- disorders with varying presence of characteristic skin lesions, blistering and mucous membrane involvement

**Table 15. Comparison of Erythema Multiforme, Stevens-Johnson Syndrome, Toxic Epidermal Necrolysis**

	Erythema Multiforme (EM)	Stevens-Johnson Syndrome (SJS)	Toxic Epidermal Necrolysis (TEN)
<b>Lesion</b>	Macules/papules with central vesicles Classic bull's-eye pattern of concentric light and dark rings (typical target lesions) Bilateral and symmetric All lesions appear within 72 h May show dermal edema Lesion "fixed" for at least 7 d	Cutaneous blistering with mucous membrane involvement (especially lips) "Atypical lesions": red circular patch with dark purple centre (aka targetoid) "Sicker" (high fever) Sheet-like epidermal detachment in <10% of BSA (Nikolsky sign)	Mucous membrane involvement, and severe blistering "Atypical lesions": 50% have no target lesions Diffuse erythema then necrosis and sheet-like epidermal detachment in >30% of BSA
<b>Sites</b>	Dorsa of hands and forearms Mucous membrane involvement (lips, tongue, buccal mucosa) is possible Extremities with face > trunk Involvement of palms and soles	Prominent face and trunk involvement Palms and soles may be spared	>30% BSA Nails may also shed
<b>Other Complications</b>	Burning and stinging Recurrences Secondary bacterial infection	Infection, scarring, contractures, eruptive nevocmelanocytic nevi, corneal scarring, blindness, phimosis and vaginal synechiae	Same as SJS's PLUS electrolyte imbalance, dehydration, tubular necrosis and acute kidney injury, epithelial erosions of trachea, death
<b>Constitutional Symptoms</b>	Weakness, malaise	Prodrome 1-14 d prior to eruption with fever and flu-like illness	High fever >38°C
<b>Etiology</b>	Infection: HSV, or <i>Mycoplasma pneumoniae</i>	Frequently drug-related (NSAIDs, anticonvulsants, sulfonamides, penicillins) Occurs up to 1-3 wk after drug exposure with more rapid onset upon rechallenge	Same as SJS
<b>Differential Diagnosis</b>	Urticaria, granuloma annulare, mycosis fungoides, vasculitis	Scarlet fever, phototoxic, eruption, GVHD, SSSS, exfoliative dermatitis, Kawasaki disease, paraneoplastic pemphigus	Same as SJS
<b>Course and Prognosis</b>	Lesions last 2 wk and heal without complications	4-6 wk course 5% mortality	30% mortality due to fluid loss, regrowth of epidermis by 3 wk, secondary infection
<b>Management</b>	Symptomatic treatment (oral antihistamines, oral antacids) Corticosteroids in severely ill (controversial) Prophylactic oral acyclovir for 6-12 mo for HSV-associated EM with frequent recurrences	Prolonged hospitalization Withdraw suspect drug Intravenous fluids Infection prophylaxis Consider IVIG vs. cyclosporine (corticosteroids controversial)	As for Stevens-Johnson syndrome Admit to burn unit Debride frankly necrotic tissue Consider IVIG vs. cyclosporine

**Intravenous Immunoglobulin Use in Patients with Toxic Epidermal Necrolysis and Stevens-Johnson Syndrome***Am J Clin Dermatol* 2006;7:359-d68**Study:** Systematic review of 17 articles

(retrospective cohort studies were most common, no RCTs).

**Patients:** Individuals with a diagnosis of SJS/TEN treated with IVIG.**Intervention:** Various doses and regimens of IVIG.**Outcomes:** Time to disease cessation, time to healing.**Results:** Eleven of 14 TEN studies reported positive results, while three studies did not observe a statistically significant improvement. Two of three SJS studies reported positive results, with one study observing no significant difference in mortality, or speed of healing.**Conclusion:** IVIG appears to have a positive impact on TEN/SJS but results cannot be statistically analyzed as a whole due to variability and inconsistency in data presented from each study. However, it is considered the gold standard treatment.

## Exanthematous Eruptions (Maculopapular Eruptions/Morbilliform)

- symmetrical, widespread, erythematous patches or plaques  $\pm$  scales
- the “classic” and most common adverse drug reaction
- often starts on trunk
- may progress to generalized exfoliative dermatitis especially if the drug is continued
- most common causes: penicillin, sulfonamides, phenytoin

## Fixed Drug Eruptions

- sharply demarcated erythematous oval patches on the skin or mucous membranes
  - sites: face, mucosa, genitalia, acral
  - reoccurs in same location upon subsequent exposure to the drug (fixed location)
- most common causes: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

## Photosensitivity Eruptions

- phototoxic reaction: “an exaggerated sunburn” confined to sun-exposed areas
- photoallergic reaction: an eczematous eruption that may spread to areas not exposed to light
- most common causes: chlorpromazine, doxycycline, thiazide diuretics, procainamide

## Serum Sickness-Like Reaction

- a symmetric drug eruption resulting in fever, arthralgia, lymphadenopathy, and skin rash (urticaria)
- usually appears 5-10 d after drug exposure
- most common causes: cefaclor in kids; bupropion (Zyban®, Wellbutrin®) in adults

## Heritable Disorders

### Ichthyosis Vulgaris

#### Clinical Presentation

- generalized hyperkeratosis leading to dry skin
- genetic deficiency in filaggrin protein
- “fish-scale” appearance especially on extremities with sparing of flexural creases, palms and soles

#### Pathophysiology

- abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

#### Epidemiology

- 1:300 incidence
- autosomal dominant inheritance
- associated with atopic dermatitis and keratosis pilaris

#### Management

- immersion in bath and oils
- emollient or humectant creams, and creams or oils containing urea or  $\alpha$ - or  $\beta$ -hydroxy acids

## Neurofibromatosis (Type I; von Recklinghausen's Disease)

### Clinical Presentation

- diagnostic criteria includes 2 or more of the following:
  1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child under age 5
  2. axillary or inguinal freckling
  3. iris hamartomas (Lisch nodules)
  4. optic gliomas
  5. neurofibromas
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. first degree relative with neurofibromatosis type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see [Pediatrics](#), P91)

### Pathophysiology

- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

### Epidemiology

- incidence 1:3,000

### Management

- watch for brain tumors such as astrocytoma
- excise suspicious or painful lesions
- see [Pediatrics](#), P92

## Vitiligo

### Clinical Presentation

- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply margined white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

### Pathophysiology

- acquired autoimmune destruction of melanocytes

### Epidemiology

- 1% incidence, polygenic
- 30% with positive family history

### Investigations

- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison's disease, Type I DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect patches of amelanosis

### Management

- sun avoidance and protection
- topical immunomodulator (i.e. tacrolimus, pimecrolimus) or a topical steroid
- PUVA or Narrow band UVB
- make-up
- "bleaching" normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

#### Interventions for Vitiligo

*Cochrane DB Syst Rev* 2010;1:CD003263

**Study:** Systematic review of randomized controlled trials.

**Patients:** 3139 participants with vitiligo.

**Intervention:** Topical treatments, light therapies, oral treatments, surgical methods, and psychological therapies

**Outcome:** >75% repigmentation, adverse effects

**Results:** Moderate evidence exists for the use of topical corticosteroids to induce repigmentation. However, adverse effects are observed with long-term use. Topical use of non-steroidal immunomodulators (i.e. tacrolimus), especially in combination with light therapies, has also been shown to induce repigmentation. However, long-term use may theoretically increase the risk for skin cancer. In general, combination therapy including some form of light therapy had the most significant improvement. Sustained repigmentation (>2 yr) has not been reported and thus results should be treated with caution.

# Infections

## Bacterial Infections

- often involve the epidermis, dermis, hair follicles or periungual region  $\pm$  systemic

### EPIDERMIS

### IMPETIGO

#### Clinical Presentation

- acute purulent infection which appears vesicular; progresses to golden yellow “honey-crusted” lesions surrounded by erythema
- can present with bullae
- sites: commonly face, arms, legs and buttocks

#### Etiology

- GAS, *S. aureus*, or both

#### Epidemiology

- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

#### Differential Diagnosis

- infected eczema, HSV, Varicella virus

#### Investigations

- Gram stain and culture of lesion fluid or biopsy

#### Management

- remove crusts, use saline compresses and topical antiseptic soaks bid
- topical antibacterials such as 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution
- systemic antibiotics such as cloxacillin or cephalexin for 7-10 d

### DERMIS

**Table 16. Comparison of Erysipelas and Cellulitis**

	Erysipelas	Cellulitis
<b>Clinical Presentation</b>	Involves upper dermis Confluent, erythematous, sharp raised edge, warm plaque, well demarcated Very painful (“St. Anthony’s fire”) Sites: face and legs Systemic symptoms: fever, chills, headache, weakness (if present, sign of more serious infection)	Involves lower dermis/subcutaneous fat Unilateral erythematous flat lesion, often with vesicles poorly demarcated, not uniformly raised Tender Sites: commonly on legs Systemic symptoms (uncommon): fever, leukocytosis, lymphadenopathy
<b>Etiology</b>	GAS	GAS, <i>S. aureus</i> (large sized wounds), <i>H. influenzae</i> (periorbital), <i>Pasteurella multocida</i> (dog/cat bite)
<b>Complications</b>	Scarlet fever, streptococcal gangrene, fat necrosis, coagulopathy Spreads via lymphatics	Uncommon
<b>Differential Diagnosis</b>	DVT (less red, less hot, smoother), superficial phlebitis, contact dermatitis, photosensitivity reaction, stasis dermatitis, panniculitis, vasculitis	Same as erysipelas
<b>Investigations</b>	Clinical diagnosis: rarely do skin/blood culture If suspect necrotizing fasciitis: do immediate biopsy and frozen section, histopathology	Same as erysipelas
<b>Management</b>	1st line: penicillin, cloxacillin or cefazolin 2nd line: clindamycin or cephalexin If allergic to penicillin, use erythromycin	1st line: cloxacillin or cefazolin/cephalexin 2nd line: erythromycin or clindamycin Children: cefuroxime If diabetes mellitus (foot infections): TMP/SMX and metronidazole

## COMMON HAIR FOLLICLE INFECTIONS

Table 17. Comparison of Superficial Folliculitis, Furuncles and Carbuncles

	Superficial Folliculitis	Furuncles (Boils)	Carbuncles
<b>Clinical Presentation</b>	Superficial infection of the hair follicle (versus pseudofolliculitis: inflammation of follicle due to friction, irritation, or occlusion) Acute lesion consists of a dome-shaped pustule at the mouth of hair follicle Pustule ruptures to form a small crust Sites: primarily scalp, shoulders, anterior chest, upper back, other hair-bearing areas	Red, hot, tender, inflammatory nodules with central yellowish point, which forms over summit and ruptures Involves subcutaneous tissue that arises from a hair follicle Sites: hair-bearing skin (thigh, neck, face, axillae, perineum, buttocks)	Deep-seated abscess formed by multiple coalescing furuncles Usually in areas of thicker skin Occasionally ulcerates Lesions drain through multiple openings to the surface Systemic symptoms may be associated
<b>Etiology</b>	Normal non-pathogenic bacteria ( <i>Staphylococcus</i> – most common; <i>Pseudomonas</i> – hot tub) <i>Pityrosporum</i>	<i>S. aureus</i>	<i>S. aureus</i>
<b>Management</b>	Antiseptic (Hibiclens®) Topical antibacterial (fusidic acid, mupirocin, or erythromycin) Oral cloxacillin for 7-10 d	Incise and drain large carbuncles to relieve pressure and pain If afebrile: hot wet packs, topical antibiotic If febrile/cellulitis: culture blood and aspirate pustules (Gram stain and C&S) Cloxacillin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy)	Same as for furuncles

## Dermatophytoses

## Clinical Presentation

- infection of skin, hair and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

## Pathophysiology

- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

## Etiology

- Trichophyton*, *Microsporum*, *Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

## Investigations

- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

## Management

- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type):
  - e.g. clotrimazole or terbinafine cream applied bid, until one week after complete resolution of lesions
- oral therapy is indicated for onychomycosis or tinea capitis:
  - e.g. terbinafine (Lamisil® – liver toxicity, CYP 2D6 inhibitor) or itraconazole (Sporanox® – CYP 3A4 inhibitor, liver toxicity)

Table 18. Different Manifestations of Dermatophyte Infection

	Clinical Presentation	Differential Diagnosis	Investigations	Management
<b>Tinea Capitis</b>	Round, scaly patches of alopecia, possibly with broken off hairs; pruritic Sites: scalp, eyelashes, and eyebrows; involving hair shafts and follicles Kerion (boggy, elevated, purulent inflamed nodule/plaque) may form secondary to infection by bacteria and result in scarring May have occipital lymphadenopathy Affects children (mainly black), immunocompromised adults Very contagious and may be transmitted from barber, hats, theatre seats, pets	Alopecia areata, psoriasis, seborrheic dermatitis, trichotillomania	Wood's light examination of hair: green fluorescence only for <i>Microsporum</i> infection Culture of scales/hair shaft Microscopic examination of KOH preparation of scales or hair shafts	Terbinafine (Lamisil®) x 4 wk NB: oral agents are required to penetrate the hair root where dermatophyte resides Adjunctive antifungal shampoos or lotions may be helpful, and may prevent spread (e.g. selenium sulfide, ketoconazole, ciclopirox)
<b>Tinea Corporis (Ringworm)</b>	Pruritic, scaly, round/oval plaque with active erythematous margin and central clearing Site: trunk, limbs, face	Granuloma annulare, pityriasis rosea, psoriasis, seborrheic dermatitis	Microscopic examinations of KOH prep of scales shows hyphae Culture of scales	Topicals: 1% clotrimazole, 2% ketoconazole 2% miconazole, terbinafine or ciclopirox olamine cream bid for 2-4 wk Oral terbinafine, or itraconazole, or fluconazole, or ketoconazole if extensive

**Table 18. Different Manifestations of Dermatophyte Infection** (continued)

	Clinical Presentation	Differential Diagnosis	Investigations	Management
<b>Tinea Cruris</b> (“Jock Itch”)	Scaly patch/plaque with a well-defined, curved border and central clearing Pruritic, erythematous, dry/macerated Site: medial thigh	Candidiasis (involvement of scrotum and satellite lesions), contact dermatitis, erythrasma	Same as for tinea corporis	Same as for tinea corporis
<b>Tinea Pedis</b> (Athlete’s Foot)	Pruritic scaling and/or maceration of the web spaces and powdery scaling of soles Acute infection: interdigital (esp. 4th web space) red/white scales, vesicles, bullae, often with maceration Secondary bacterial infection may occur Chronic: non-pruritic, pink, scaling keratosis on soles and sides of feet May present as flare-up of chronic tinea pedis Predisposing factors: heat, humidity, occlusive footwear	Atopic dermatitis, contact dermatitis, dyshidrotic dermatitis, erythrasma, intertrigo, inverse psoriasis	Same as for tinea corporis	Same as for tinea corporis
<b>Tinea Manuum</b>	Primary fungal infection of the hand is rare; usually associated with tinea pedis Acute: blisters at edge of red areas on hands Chronic: single dry scaly patch	Atopic dermatitis, contact dermatitis, granuloma annulare, psoriasis	Same as for tinea corporis	Same as for tinea corporis
<b>Tinea Unguium</b> (Onychomycosis)	Crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris Toenail infections usually precede fingernail infections <i>T. rubrum</i> (90% of all toenail infections)	Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophies, bacterial infections	Microscopic examinations of KOH prep of scales from subungual scraping shows hyphae Culture of subungual scraping or nail clippings on Sabouraud’s agar PAS stain of nail clipping by pathology	Terbinafine (Lamisil®) (6 wk for fingernails, 12 wk for toenails) Itraconazole (Sporanox®) 7 d on, 3 wk off (2 pulses for fingernails, 3 pulses for toenails) Topical: ciclopirox (Penlac®); nail laquer (often ineffective)

## Parasitic Infections

### SCABIES

#### Clinical Presentation

- a transmissible parasitic skin infection due to *Sarcoptes scabiei*, a mite, characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)

#### Pathogenesis

- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

#### Etiology

- Sarcoptes scabiei*
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

#### Differential Diagnosis

- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

#### Investigations

- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces

#### Management

- bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- change underwear and linens; wash with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid potency topical steroids and antihistamines for symptom management

## LICE (PEDICULOSIS)

### Clinical Presentation

- intensely pruritic red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs
  - red excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs
  - excoriations
- body lice: nits and lice in seams of clothing
  - excoriations and secondary infection mainly on shoulders, belt-line and buttocks

### Differential Diagnosis

- bacterial infection of scalp, seborrheic dermatitis

### Management

- permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwellada-P® shampoo)
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry

## BED BUGS (HEMIPTERA)

- thought to have been eradicated in developed world during 1940s
- increasing in prevalence since 1995

### Clinical Presentation

- burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch and dinner” in areas with easy access (face, neck, arms, legs, hands)

### Etiology

- caused by *Cimex lectularius*, a small insect that feeds mainly at night
- during day bedbugs hide in crevices in walls and furniture

### Differential Diagnosis

- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

### Management

- professional fumigation of home
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture

## Viral Infections

### HERPES SIMPLEX

#### Clinical Presentation

- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- **primary**
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- **secondary**
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- **potential complications**
  - dendritic corneal ulcer
  - EM
  - herpes simplex encephalitis (infants at risk)
  - HSV infection on atopic dermatitis causing Kaposi's varicelliform eruption (eczema herpeticum)
- two biologically and immunologically different subtypes: HSV-1 and HSV-2

**HSV-1**

- typically “cold sores” (grouped vesicles at the mucocutaneous junction which quickly burst)
- recurrent on face, lips and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)

**Management**

- treat during prodrome to prevent vesicle formation
- topical antiviral (Zovirax®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
- oral antivirals are far more effective and have an easier dosing schedule

**HSV-2**

- sexually transmitted; incubation 2-20 d
- gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
- vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
- urethritis: watery discharge in males
- recurrent on vulva, vagina, penis for 5-7 d
- diagnosis
  - negative dark field, negative serology for syphilis, negative bacterial cultures
  - Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
  - tissue culture and electron microscopy of vesicular fluid
  - skin biopsy
  - antibody titres increase one week after primary infection only (no increase with recurrent lesions)
- ddx of genital ulcers: *Candida* balanitis, chancroid, syphilitic chancres

**Management**

- rupture vesicle with sterile needle if you wish to culture it
- wet dressing with aluminum subacetate solution, Burow's compression, or betadine solution
- 1st episode: acyclovir 200 mg PO 5 times a day x 10 d
  - maintenance: acyclovir 400 mg PO bid
- famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
- in case of herpes genitalis, look for and treat any other sexually-transmitted infections
- for active lesions in pregnancy, see [Obstetrics](#), OB21

**HERPES ZOSTER (SHINGLES)****Clinical Presentation**

- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days – weeks
- pain is pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson's sign: involvement of tip of nose suggests eye involvement
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

**Etiology**

- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy

**Differential Diagnosis**

- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

**Management**

- compress with normal saline, Burow's, or betadine solution
- analgesics (NSAIDs, amitriptyline)
- famciclovir or valacyclovir or acyclovir for 7 d; must initiate within 72 h to be of benefit
- gabapentin 300-600 mg PO tid for post-herpetic neuralgia

**MOLLUSCUM CONTAGIOSUM****Clinical Presentation**

- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus [*Molluscum contagiosum* virus (MCV)]
- sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

**Etiology**

- MCV is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)

Both HSV-1 and HSV-2 can occur on face or genitalia.

Herpes Zoster typically involves a single dermatome; lesions rarely cross the midline.

**Management**

- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

**WARTS (VERRUCA VULGARIS) [HUMAN PAPILLOMAVIRUS (HPV) INFECTIONS]****Table 19. Different Manifestations of HPV Infection**

	Definition and Clinical Features	Differential Diagnosis	Distribution	HPV Type
<b>Verruca Vulgaris (Common Warts)</b>	Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV Paring of surface reveals punctate, red-brown specks (thrombosed capillaries)	Molluscum contagiosum, seborrheic keratosis	Located at trauma sites: fingers, hands, knees of children and teens	At least 80 types are known
<b>Verruca Plantaris (Plantar Warts) and Verruca Palmaris (Palmar Warts)</b>	Hyperkeratotic, shiny, sharply margined growths Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges	May need to scrape ("pare") lesions to differentiate wart from callus and corn (see sidebar, D7)	Located at pressure sites: metatarsal heads, heels, toes	Commonly HPV 1, 2, 4, 10
<b>Verruca Planae (Flat Warts)</b>	Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children	Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus	Sites: face, dorsa of hands, shins, knees	Commonly HPV 3, 10
<b>Condyloma Acuminata (Genital Warts)</b>	Skin-coloured pinhead papules to soft cauliflower like masses in clusters Often occurs in young adults, infants, children Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhitening (subclinical lesions seen with 5% acetic acid x 5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)	Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), Molluscum contagiosum	Sites: genitalia and perianal areas	Commonly HPV 6 and 11 HPV 16, 18, 31, 33 cause cervical dysplasia, SCC and invasive cancer

**Table 20. Management of Warts**

Management	Type of Wart	Notes
<b>Destructive</b>		
Cryotherapy/electrodesiccation	All	Dyschromia, pain, blisters
Surgery	Resistant	Scar, recurrence
Laser	Resistant	CO <sub>2</sub> laser
<b>Caustic Acids</b>		
Cantharidin (topical)	Small, common	Keratolytic irritation, blisters, hyperpigmentation
Mono-, di-, or tri-chloroacetic acid	Common	Irritation, blisters, scar
<b>Chemotherapeutic Agents</b>		
Podophyllotoxin*	Genital	Erythema, erosions, ulcers, pain
Bleomycin (intralesional)*	Common	Pain, nail loss/dystrophy, Raynaud's phenomenon
<b>Hypersensitivity Agents</b>		
Dinitrochlorobenzene (DNCB), diphenylcyprone	Common, plantar	Causes an allergic/hypersensitivity reaction
Candida antigen (intralesional)	Genital	Erythema, burning, erosion
Immune Response Modifiers	Genital	
5% imiquimod cream (Aldara®)*	All	
<b>Miscellaneous</b>		
No treatment	Common	65-90% resolve spontaneously over several years
Salicylic acid 40% minimum	Common, plantar	OTC, use with occlusion
Tretinoin (topical)*	Flat	Irritation
Cimetidine (oral)*	Resistant	Best in children
Canthone plus	Common, plantar	Cantharidin + podophyllin + salicylic acid
Duct tape		
± occlusion/callous scraping/paring		

\*Avoid in pregnancy

- other viruses associated with skin changes, e.g. measles, roseola, fifth disease, etc.
- see *Pediatric Exanthems*, D40

**Treatment for Skin Warts****First Line Therapies**

- Salicylic acid preparations (patches, solutions, creams, ointments)
- Cryotherapy
- Topical cantharone

**Second Line Therapies**

- Topical imiquimod
- Topical 5-Fluorouracil
- Topical tretinoin
- Podophyllotoxin

**Third Line Therapies**

- Curettage
- Cautery
- Surgery
- Laser
- Oral cimetidine (particularly children)
- Topical 5-fluorouracil
- Topical tretinoin (flat warts)
- Localized heat therapy
- Intralesional bleomycin (plantar warts)

**Treatment for Anogenital Warts****First line therapies**

- Imiquimod cream
- Podophyllotoxin (solution, cream, or gel)
- Cryotherapy

**Second line therapies**

- Trichloroacetic acid
- Topical 5-fluorouracil
- Topical tretinoin
- Electrodesiccation
- Surgical excision (with cold steel or scissors)
- CO<sub>2</sub> laser

## Yeast Infections

### CANDIDIASIS

#### Candidal Paronychia

- painful red swellings of periungual skin
- management: topical agents not as effective; oral antifungals recommended

#### Candidal Intertrigo

- macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
- peripheral "satellite" pustules
- predisposing factors: obesity, diabetes, systemic antibiotics, immunosuppression, malignancy
- starts as non-infectious maceration from heat, moisture and friction
- management: keep area dry, miconazole, ketoconazole/clotrimazole cream bid until rash clears

### PITYRIASIS (TINEA) VERSICOLOR

#### Clinical Presentation

- chronic asymptomatic superficial fungal infection with brown/white scaling macules
- affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- sites: upper trunk most common

#### Pathophysiology

- microbe produces carboxylic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; require fatty acids to survive

#### Etiology

- *Pityrosporum ovale* (*Malassezia furfur*)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, Cushing's syndrome, prolonged corticosteroid use

#### Investigations

- microscopic examination, KOH prep of scales for hyphae and spores

#### Management

- ketoconazole shampoo or cream PO daily for 7 d if more extensive
- topical terbinafine or ciclopirox olamine
- systemic fluconazole or itraconazole for 7 d

Oral Terbinafine (Lamisil®) is not effective because it is not secreted by sweat glands.

## Sexually Transmitted Infections

### SYPHILIS

#### Clinical Presentation

- characterized initially by a painless ulcer (chancre)
- following inoculation, systemic infection with secondary and tertiary stages

#### Etiology

- *Treponema pallidum*
- transmitted sexually, congenitally, or rarely by transfusion

#### Natural History of Untreated Syphilis

- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)

#### Latent Syphilis

70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection.

Table 21. Stages of Syphilis

	Primary Syphilis	Secondary Syphilis	Tertiary Syphilis
<b>Clinical Presentation</b>	<ul style="list-style-type: none"> <li>Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate</li> <li>Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus</li> <li>Regional non-tender lymphadenopathy appears &lt;1 wk after onset of chancre</li> <li>DDx: chancroid (painful), HSV (multiple lesions)</li> </ul>	<ul style="list-style-type: none"> <li>Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre)</li> <li>Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia</li> <li>Lesions heal in 1-5 wk and may recur for 1 yr</li> <li>3 types of lesions:               <ol style="list-style-type: none"> <li>Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus)</li> <li>Condyloma lata: wart-like moist papules around genital/perianal region</li> <li>Mucous patches: macerated patches mainly found in oral mucosa</li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>Extremely rare</li> <li>3-7 yr after secondary</li> <li>Main skin lesion: 'Gumma' – a granulomatous non-tender nodule</li> </ul>
<b>Investigations</b>	<ul style="list-style-type: none"> <li>CANNOT be based on clinical presentation alone</li> <li>VDRL negative – repeat weekly for 1 mo</li> <li>Fluorescent treponemal antibody-syphilis (FTA-ABS) test has greater sensitivity and may detect disease earlier in course</li> <li>Dark field examination – spirochete in chancre fluid or lymph node aspirate</li> </ul>	<ul style="list-style-type: none"> <li>VDRL positive</li> <li>FTA-ABS +ve; –ve after 1 yr following appearance of chancre</li> <li>Dark field +ve in all secondary</li> </ul>	<ul style="list-style-type: none"> <li>As in primary syphilis, VDRL can be falsely negative</li> </ul>
<b>Management</b>	<ul style="list-style-type: none"> <li>Penicillin G, 2.4 million units IM, single dose</li> </ul>	<ul style="list-style-type: none"> <li>As for primary syphilis</li> </ul>	<ul style="list-style-type: none"> <li>Treatment: penicillin G, 2.4 million units IM weekly x 3 wk</li> </ul>

## GONOCOCCEMIA

### Clinical Presentation

- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

### Etiology

- Neisseria gonorrhoeae*

### Management

- notify Public Health authorities
- screen for other sexually transmitted infections (STIs)
- cefixime 400 mg PO (drug of choice) or ceftriaxone 125 mg IM

### HSV

- see *Viral Infections*, D29

### HPV

- see *Viral Infections*, D30

## Pre-Malignant Skin Conditions

### Actinic Keratosis (Solar Keratosis)

#### Clinical Presentation

- ill-defined, scaly erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

#### Pathophysiology

- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of actinic keratosis (AK) to SCC (~1/1000), but higher likelihood if AK is persistent

#### Types of Actinic Keratosis (AK)

- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

**Epidemiology**

- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III (see sidebar, D3), rare in darker skin as melanin is protective

**Differential Diagnosis**

- SCC in situ, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

**Investigations**

- biopsy lesions that are refractory to treatment

**Management**

- destructive: cryotherapy, electrodesiccation and curettage
- pharmacotherapy: 5-fluorouracil cream for 2-3 wk, imiquimod cream for 8-10 wk, photodynamic therapy
- excision

## Leukoplakia

**Clinical Presentation**

- a morphologic term describing homogenous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

**Pathophysiology**

- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption

**Epidemiology**

- 1-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

**Differential Diagnosis**

- lichen planus, oral hairy leukoplakia

**Investigations**

- biopsy is mandatory because it is premalignant

**Management**

- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, follow-up
- moderate/dysplastic lesions: excision, cryotherapy

## Malignant Skin Tumours

### Non-Melanoma Skin Cancers

**BASAL CELL CARCINOMA (BCC)****Subtypes**

- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent ("pearly") telangiectatic border and depressed/eroded/ulcerated centre
- pigmented variant
  - flecks of pigment in translucent lesion with surface telangiectasia
  - may mimic malignant melanoma
- superficial variant
  - flat, tan to red-brown plaque, often with scaly, pearly border and fine telangiectasia at margin
  - least aggressive subtype
- sclerosing (morphoeaform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

**Pathophysiology**

- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on face
  - may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin syndrome)

**Epidemiology**

- most common malignancy in humans
- 75% of all malignant skin tumours >40 yr, increased prevalence in the elderly
- M>F, skin phototypes I and II, chronic cumulative sun exposure

**Differential Diagnosis**

- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular malignant melanoma, SCC

**Management**

- imiquimod 5% cream (Aldara®) or cryotherapy is indicated for superficial BCCs on the trunk
- shave excision + electrodesiccation and curettage for most types of BCCs, not including morpheaform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct
- radiotherapy used in advanced cases of BCC where surgical intervention is not an option
- life-long follow-up
- 95% cure rate if lesion <2 cm in diameter or if treated early

**Work-up/Investigations of Basal cell Carcinoma and other Non-melanoma Skin Cancers**

- **History:** duration, growth rate, family/personal hx of skin cancer, prior therapy to the particular lesion
- **Physical:** location, size, whether circumscribed, tethering to deep structures, full skin exam, lymph node exam
- **Biopsy:** if shallow lesion, can do shave biopsy; otherwise punch or excisional biopsy may be more appropriate

**Surgical Margins**

- **Smaller lesions:** electrodesiccation and curettage with 2-3 mm margin of normal skin
- **Deep infiltrative lesions:** surgical excision with 3-5 mm margins beyond visible and palpable tumour border, which may require skin graft or flap; or Mohs surgery, which conserves tissue and does not require margin control

**SQUAMOUS CELL CARCINOMA (SCC)****Clinical Presentation**

- indurated erythematous nodule/plaque with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- sites: face, ears, scalp, forearms, dorsum of hands

**Pathophysiology**

- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

**Epidemiology**

- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients SCC is most common cutaneous malignancy, with increased mortality as compared to non-immunocompromised population

**Differential Diagnosis**

- benign: nummular eczema, psoriasis, irritated seborrheic keratosis
- malignant: keratoacanthoma, Bowen's disease, BCC

**Management**

- surgical excision with primary closure, skin flaps or grafting
- Mohs surgery
- lifelong follow-up (more aggressive treatment than BCC)

**Prognosis**

- good prognostic factors: early treatment, negative margins, and small size of lesion
- SCCs that arise from actinic keratosis metastasize less frequently (~1%) than other SCCs (e.g. arising de novo in old burns) (2-5% of cases)
- overall control is 75% over 5 yr, 5-10% metastasize

**OTHER FORMS OF SQUAMOUS CELL CARCINOMA (SCC)****BOWEN'S DISEASE (SQUAMOUS CELL CARCINOMA IN SITU)****Clinical Presentation**

- erythematous plaque with a sharply demarcated red and scaly border
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

**Management**

- same as for BCC
- biopsy required for diagnosis
- topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify margins of poorly defined tumours
- cryosurgery
- shave excision with electrodesiccation and curettage

**KERATOACANTHOMA****Clinical Presentation**

- rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled crater, resembling an erupting volcano
- may spontaneously regress within a year, leaving a scar
- sites: sun-exposed skin

**Pathophysiology**

- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

**Etiology**

- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

**Epidemiology**

- >50 yr, rare <20 yr

**Differential Diagnosis**

- treat as SCC until proven otherwise
- hypertrophic solar keratosis, verruca vulgaris

**Management**

- surgical excision, treated similarly to SCC

**Malignant Melanoma (MM)****Clinical Presentation**

- malignant characteristics of a mole: see mnemonic "ABCDE"
- sites: skin, mucous membranes, eyes, CNS

**Clinical Subtypes of Malignant Melanoma**

- **lentigo maligna**
  - malignant melanoma in situ (normal and malignant melanocytes confined to the epidermis)
  - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
  - lesion grows radially and produces complex colours
  - often seen in the elderly
  - 10% evolve to lentigo maligna melanoma
- **lentigo maligna melanoma** (15% of all melanomas)
  - malignant melanocytes invading into the dermis
  - associated with pre-existing solar lentigo, not pre-existing nevi
  - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  - with time, colour changes from uniform brown to dark brown with black and blue
  - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
- **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discolouration, focal papules or nodules
  - ulcerate and bleed with growth

**Does this Patient have a Mole or Melanoma?****ABCDE checklist****Asymmetry****Border** (irregular and/or indistinct)**Colour** (varied)**Diameter** (increasing or >6 mm)**Enlargement, elevation, evolution** (i.e. change in colour, size or shape)

Sensitivity 92% (CI 82-96%)

Specificity 100% (CI 54-100%)

JAMA 1998;279:696-701

- **nodular melanoma** (30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - “EFG” Elevated, Firm, Growing
- **acrolentiginous melanoma** (5% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungual skin
  - melanomas on mucous membranes have poor prognosis

### Pathophysiology

- malignant neoplasm of pigment forming cells (melanocytes and nevus cells)

### Epidemiology

- incidence 1/75 (Canada) 1/50 (US)
- risk factors: numerous moles, fair skin, red hair, positive personal/family history, large congenital nevi, familial dysplastic nevus syndrome, multiple dysplastic nevi
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

### Differential Diagnosis

- benign: nevi, solar lentigo, seborrheic keratosis
- malignant: pigmented BCC

### Management

- excisional biopsy preferable, otherwise incisional biopsy
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic, gene therapies and vaccines starting to be used in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

**Table 22. American Joint Committee on Cancer Staging System Based on Breslow's Thickness of Invasion**

T1 <1.0 mm	Stage I T1a – T2a	5-yr survival 90%
T2 1.01-2.0 mm	Stage II T2b – T4b	5-yr survival 70%
T3 2.01-4.0 mm	Stage III any nodes	5-yr survival 45%
T4 >4.0 mm	Stage IV any mets	5-yr survival 10%

a = no ulceration; b = ulceration

#### Risk Factors for Melanoma

**no SPF is a SIN**

**Sun exposure**

**Pigment traits** (blue eyes, fair/red hair, pale complexion)

**Freckling**

**Skin reaction to sunlight** (increased incidence of sunburn)

**Immunosuppressive states** (e.g. renal transplantation)

**Nevi** (dysplastic nevi; increased number of benign melanocytic nevi)

#### Node Dissection for Lesions

> 1 mm thick OR < 1 mm and ulcerated OR > 1 mitoses/mm<sup>2</sup> (Stage IB or higher melanoma patients should be offered a sentinel lymph node biopsy)

- Assess sentinel node at time of wide excision

## Other Cutaneous Cancers

### CUTANEOUS T-CELL LYMPHOMA

#### Clinical Presentation

- **Mycosis fungoides** (limited superficial type)
  - characterized by: erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease
- **Sézary syndrome** (widespread systemic type)
  - rare variant characterized by: erythroderma, lymphadenopathy, WBC >20 x 10<sup>9</sup>/L with Sézary cells
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - often fatal

#### Pathophysiology

- clonal proliferation of skin-homing CD4 T cells

#### Epidemiology

- >50 yr old, M:F 2:1

**Differential Diagnosis**

- tinea corporis, nummular dermatitis, psoriasis, discoid lupus erythematosus, Bowen's disease

**Investigations**

- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
- imaging (for systemic involvement)

**Management**

- **Mycosis fungoides**
  - treatment is dependent on stage of disease
  - topical steroids and/or PUVA, narrow band (311-313 nm), UVB (NBUVB)
- **Sézary syndrome**
  - oral retinoids and IFN
  - extra-corporeal photophoresis
  - may need radiotherapy for total skin electron beam radiation
  - may maintain on UV therapy
  - other chemotherapy agents

## Alopecia (Hair Loss)

### Hair Growth

- hair grows in a cyclic pattern that is defined in 3 stages
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

**Hair Loss****TOP HAT**

Telogen effluvium, tinea capitis

Out of Fe, Zn

Physical: trichotillomania, "corn-row" braiding

Hormonal: hypothyroidism, androgenic

Autoimmune: SLE, alopecia areata

Toxins: heavy metals, anticoagulants, chemotherapy, vitamin A, SSRIs

## Non-Scarring (Non-Cicatricial) Alopecia

**ANDROGENETIC ALOPECIA****Clinical Presentation**

- male-pattern or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, "Christmas tree" pattern

**Pathophysiology**

- action of testosterone on hair follicles

**Epidemiology**

- males: early 20s-30s
- females: 40s-50s

**Management**

- minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- spironolactone in women (anti-androgenic effects), cyproterone acetate (Diane-35®)
- finasteride (Propecia®) (5- $\alpha$ -reductase inhibitor) 1 mg/d in men
- hair transplant

**PHYSICAL**

- trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
- traumatic (e.g. tight "corn-row" braiding of hair, wearing tight pony tails, tight tying of turbans)

**TELOGEN EFFLUVIUM****Clinical Presentation**

- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

**Non-scarring alopecia:** intact hair follicles on exam → biopsy not required (but may be helpful).

**Scarring alopecia:** absent hair follicles on exam → biopsy required.

**DDx of Non-scarring (non-cicatricial) Alopecia**

- **Autoimmune**
  - Alopecia areata
- **Endocrine**
  - Hypothyroidism
  - Androgens
- **Micronutrient deficiencies**
  - Iron
  - Zinc
- **Toxins**
  - Heavy metals
  - Anticoagulants
  - Chemotherapy
  - Vitamin A
- **Trauma to the hair follicle**
  - Trichotillomania
  - 'Corn-row' braiding
- **Other**
  - Syphilis
  - Severe illness
  - Childbirth

**Pathophysiology**

- precipitated by: malnutrition, Fe deficiency, thyroid dysfunction, post-partum/miscarriage, scalp diseases (seborrheic dermatitis, allergic contact dermatitis), medications (e.g. OCP), physical/mental stress
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few months but may not be complete

**ANAGEN EFFLUVIUM****Clinical Presentation**

- hair loss due to insult to hair follicle impairing its mitotic activity (growth stage)

**Pathophysiology**

- precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

**ALOPECIA AREATA****Clinical Presentation**

- autoimmune disorder characterized by patches of complete hair loss often localized to scalp but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- “exclamation mark” pattern (hairs fractured and have tapered shafts, i.e. looks like “!”)
- may be associated with pernicious anemia, vitiligo, thyroid disease, Addison’s disease
- spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress

**Management**

- generally unsatisfactory
- intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- UV or PUVA therapy
- immunomodulatory (diphencyprone)

**Precipitants of Telogen Effluvium**  
**“SEND”** hair follicles out of anagen and into telogen

**Stress and Scalp disease (surgery)**  
**Endocrine** (hypothyroidism, post-partum)  
**Nutritional** (iron and protein deficiency)  
**Drugs** (Acitretin, heparin, lithium, interferon,  $\beta$ -blockers, valproic acid, SSRIs)

**Alopecia Areata Subtypes**

**Alopecia totalis:** loss of all scalp hair and eyebrows

**Alopecia universalis:** loss of all body hair

**DDx of Scarring (cicatricial) Alopecia****Developmental/Hereditary Disorders**

- Aplasia cutis congenita
- Epidermal nevi
- Romberg’s syndrome
- Generalized follicular hamartoma

**Primary causes**

- Group 1: Lymphocytic
  - Discoid lupus erythematosus
  - Lichen planopilaris
  - Central centrifugal cicatricial alopecia
  - Classic Pseudopelade
- Group 2: Neutrophilic
  - Folliculitis decalvans
  - Dissecting scalp cellulitis
- Group 3: Mixed
  - Acne keloidalis nuchae

**Secondary causes**

- Infectious agents
  - Bacterial (e.g. post-cellulitis)
  - Fungal (e.g. tinea capitis)
- Neoplasms (e.g. BCC, SCC, lymphomas, and metastatic tumours)
- Physical agents
  - Mechanical trauma
  - Burns
  - Radiotherapy
  - Caustic chemicals

**Scarring (Cicatricial) Alopecia****Clinical Presentation**

- irreversible loss of hair follicles with fibrosis

**Etiology**

- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HZV)
- inflammatory
  - lichen planus (lichen planopilaris)
  - DLE (note that SLE can cause an alopecia unrelated to discoid lupus lesions which are non-scarring)
  - morphea: “coup de sabre” with involvement of centre of scalp
  - central centrifugal cicatricial alopecia: seen in up to 40% of black women, starting at central scalp; one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population

**Investigations**

- biopsy from active border

**Management**

- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials

## Nails and Disorders of the Nail Apparatus

**Table 23. Nail Changes in Systemic and Dermatological Conditions**

Nail Abnormality	Definition/Etiology	Associated Disease
<b>NAIL PLATE CHANGES</b>		
Clubbing	Proximal nail plate has greater than 180 degree angle to nail fold, watch-glass nails, bulbous digits	Cyanotic heart disease, bacterial endocarditis, pulmonary disorders, GI disorders, etc.
Koilonychia	Spoon shaped nails	Iron deficiency, malnutrition, diabetes
Onycholysis	Separation of nail plate from nail bed	Psoriasis, dermatophytes, thyroid disease
Onychogryphosis	Hypertrophy of the nail plate and subungual hyperkeratosis	Poor circulation, chronic inflammation, tinea
Onychohemia	Subungual hematoma	Trauma to nail bed
Onychomycosis	Fungal infection of nail (e.g. dermatophyte, yeast, mould)	HIV, DM, peripheral arterial disease
Onychocryptosis (ingrown toenail)	Often hallux with congenital malalignment, painful inflammation, granulation tissue	Tight fitting shoes, excessive nail clipping
<b>SURFACE CHANGES</b>		
V-shaped nicking	Distal margin has v-shaped loss of the nail plate	Darier's disease (follicular dyskeratosis)
Pterygium inversus unguis	Distal nail plate does not separate from underlying nail bed	Scleroderma
Pitting	Punctate depressions that migrate distally with growth	Psoriasis (random pattern), alopecia areata (geometric, gridshaped arrangement), eczema
Transverse ridging	Transverse depressions often more in central portion of nail plate	Serious acute illness slows nail growth (when present in all nails = Beau's lines), eczema, chronic paronychia, trauma
Transverse white lines	Bands of white discolouration	Poisons, hypoalbuminemia (Muehrke's lines)
<b>COLOUR CHANGES</b>		
Yellow		Tinea, jaundice, tetracycline, pityriasis rubra pilaris, yellow nail syndrome, psoriasis, tobacco use
Green		Pseudomonas
Black		Melanoma, hematoma
Brown		Nicotine use, psoriasis, poisons, longitudinal melanonychia (ethnic)
Splinter hemorrhages	Extravasation of blood from longitudinal vessels of nail bed, blood attaches to overlying nail plate and moves distally as it grows	Trauma, bacterial endocarditis, blood dyscrasias, psoriasis
Oil spots	Brown-yellow discolouration	Psoriasis
<b>NAIL FOLD CHANGES</b>		
Herpetic whitlow	HSV infection of distal phalanx	HSV infection
Paronychia	Local inflammation of the nail fold around the nail bed	Acute: painful infection Chronic: constant wetting (e.g. dishwashing, thumbsucking)
Nail fold telangiectasias	Cuticular hemorrhages, roughness, capillary changes	Scleroderma, SLE, dermatomyositis

## Skin Manifestations of Systemic Disease

**Table 24. Skin Manifestations of Internal Conditions**

Disease	Related Dermatoses
<b>AUTOIMMUNE DISORDERS</b>	
Behçet's disease	Painful aphthous ulcers in oral cavity ± genital mucous membranes, erythema nodosum, acneiform papules
Buerger's disease	Superficial migratory thrombophlebitis, pallor, cyanosis, gangrene, ulcerations, digital resorptions
Dermatomyositis	Periorbital and extensor violaceous erythema, heliotrope with edema, Gottron's papules (violaceous flat-topped papules with atrophy), periungual erythema, telangiectasia, calcinosis cutis
Polyarteritis nodosa	Subcutaneous nodules, stellate purpura, erythema, gangrene, splinter hemorrhages, livedo reticularis, ulceration
Rheumatic fever	Petechiae, urticaria, erythema nodosum, rheumatic nodules, evanescent rash
Scleroderma	Raynaud's, nonpitting edema, waxy/shiny/tense atrophic skin (morphea), ulcers, cutaneous calcification, periungual telangiectasia, acrosclerosis, salt-and-pepper pigmentation
Systemic lupus erythematosus	Malar erythema, discoid rash (erythematous papules or plaques with keratotic scale, follicular plugging, atrophic scarring on face, hands, and arms), hemorrhagic bullae, palpable purpura, urticarial purpura, patchy/diffuse alopecia, mucosal ulcers, photosensitivity
Crohn's Disease/Ulcerative colitis	Pyoderma gangrenosum, erythema nodosum, Sweet's syndrome

### Raynaud's Phenomenon DDx

#### COLD HAND

Cryoglobulins/Cryofibrinogens  
Obstruction/Occupational  
Lupus erythematosus, other connective tissue disease  
Diabetes mellitus/Drugs  
Hematologic problems (polycythemia, leukemia, etc)  
Arterial problems (atherosclerosis)  
Neurologic problems (vascular tone)  
Disease of unknown origin (idiopathic)

**Table 24. Skin Manifestations of Internal Conditions** (continued)

Disease	Related Dermatoses
<b>ENDOCRINE DISORDERS</b>	
Addison's disease	Generalized hyperpigmentation or limited to skin folds, buccal mucosa and scars
Cushing's syndrome	Moon facies, purple striae, acne, hyperpigmentation, hirsutism, atrophic skin with telangiectasia
Diabetes mellitus	Infections (boils, carbuncles, <i>Candidiasis</i> , <i>S. aureus</i> , dermatophytoses, tinea pedis and cruris, infectious eczematoid dermatitis), pruritus, eruptive xanthomas, necrobiosis lipoidica diabetorum, granuloma annulare, diabetic foot, diabetic bullae, acanthosis nigricans, calciphylaxis
Hyperthyroidism	Moist, warm skin, seborrhea, acne, nail atrophy, hyperpigmentation, toxic alopecia, pretibial myxedema, acropachy, onycholysis
Hypothyroidism	Cool, dry, scaly, thickened, hyperpigmented skin; toxic alopecia with dry, coarse hair, brittle nails, myxedema, loss of lateral 1/3 eyebrows
<b>HIV-RELATED</b>	
Infections	Viral (HSV, HZV, HPV, CMV, molluscum contagiosum, oral hairy leukoplakia), bacterial (impetigo, acneiform folliculitis, dental caries, cellulitis, bacillary epithelioid angiomatosis, syphilis), fungal (candidiasis, histoplasmosis, cryptococcus, blastomycosis)
Inflammatory dermatoses	Seborrhea, psoriasis, pityriasis rosea, vasculitis
Malignancies	Kaposi's sarcoma, lymphoma, BCC, SCC, MM
<b>MALIGNANCY</b>	
Adenocarcinoma	
Gastrointestinal (GI)	Peutz-Jeghers: pigmented macules on lips/oral mucosa
Cervix/anus/rectum	Paget's disease: eroding scaling plaques of perineum
Carcinoma	
Breast	Paget's disease: eczematous and crusting lesions of breast
GI	Palmoplantar keratoderma: thickened skin of palms/soles
Thyroid	Sipple's syndrome: multiple mucosal neuromas
Breast/GU/lung/ovary	Dermatomyositis: heliotrope erythema of eyelids and violaceous plaques over knuckles
Lymphoma/Leukemia	
Hodgkin's	Ataxia Telangiectasia: telangiectasia on pinna, bulbar conjunctiva
Acute Leukemia	Ichthyosis: generalized scaling especially on extremities, Sweet's syndrome
	Bloom's syndrome: butterfly erythema on face, associated with short stature
Multiple Myeloma	Amyloidosis: large, smooth tongue with waxy papules on eyelids, nasolabial folds and lips, as well as facial petechiae
<b>OTHERS</b>	
Liver disease	Pruritus, hyperpigmentation, spider nevi, palmar erythema, white nails (Terry's nails), porphyria cutanea tarda, xanthomas, hair loss, jaundice
Renal disease	Pruritus, pigmentation, half and half nails, perforating dermatosis, calciphylaxis
Pruritic urticaria papules and plaques of pregnancy	Erythematous papules or urticarial plaques in distribution of striae distensae: buttocks, thighs, upper inner arms and lower backs
Cryoglobulinemia	Palpable purpura in cold-exposed areas, Raynaud's, cold urticaria, acral hemorrhagic necrosis, bleeding disorders, associated with hepatitis C infection

**Acanthosis Nigricans**

An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with diabetes, obesity and other endocrine disorders and malignancy. It is a cutaneous marker of tissue insulin resistance.

**Itchy Eruptions in Childhood****UC-SCAB**

Urticaria  
Contact dermatitis  
Scabies  
Chicken pox  
Atopic dermatitis  
Bites

## Pediatric Exanthems

**Definitions**

- exanthem: an eruption on the skin occurring as a symptom of a systemic disease typically with a fever
- enanthem: an eruption on a mucous membrane occurring in the context of an exanthem

**Table 25. Common Pediatric Exanthems**

Exanthem	Etiology	Clinical Description	Important Complications	Management
<b>Chicken Pox</b>	HHV3 Incubation 10-21 d, Communicable 1-2 d pre-rash to 5 d post-rash	Diffuse itchy vesicular pustular eruption beginning on thorax spreading to extremities New lesions every 2-3 d (multiple stage eruption: macule-papule-vesicle-crust) Enanthems	Secondary infection, necrotizing fasciitis, meningitis, encephalitis, cerebellar ataxia, pneumonitis, disseminated intravascular coagulation (DIC), hepatitis	Supportive treatment, acyclovir or valacyclovir, IV if severe; if severe, Varicella Zoster immunoglobulin (within 96 h of contact), Varicella vaccine
<b>Enteroviral</b>	Enteroviruses Most common exanthem in summer and fall	Polymorphous rash (macules, papules, vesicles, petechiae, urticaria)	None	Supportive treatment for majority Serious cases (immunosuppressed) can be treated with pleconaril
<b>Erythema Infectiosum</b>	Parvovirus B19 Incubation 4-14 d Peaks in winter and spring	Slapped cheeks (red, flushed cheeks) then 1-4 d later lacy/reticular maculo-papular rash of trunk/extremities Glove and stocking purpura	STAR complex (Sore Throat, Arthritis, Rash) Fetal infection (anemia, fetal hydrops or death) Aplastic crisis in sickle cell patients	No treatment: children often feel well NSAIDs for symptomatic arthropathy

**Table 25. Common Pediatric Exanthems** (continued)

Exanthem	Etiology	Clinical Description	Important Complications	Management
<b>Gianotti-Crosti Syndrome</b>	Epstein-Barr virus most common, hepatitis B, Coxsackie, Parvovirus Spring and early summer	Symmetric papular eruption of face, buttocks, and extremities Sparing of trunk Preceded by viral prodrome	None	Supportive treatment
<b>Hand, Foot and Mouth Disease</b>	Coxsackie A and B viruses Highly contagious virus	Vesicular eruption of palms and soles with an erosive stomatitis Enanthem: vesicles involving tongue and posterior pharynx	Pulmonary, dehydration, neurological death	Supportive treatment
<b>Kawasaki Disease</b>	Unknown etiology – infectious etiology suggested Late winter to early spring	Fever >5 d and 4/5: unilateral lymphadenopathy; puffy/red palms and soles; red, cracked lips/strawberry tongue; skin rash; non-purulent bilateral conjunctivitis	Most common cause of vasculitis and acquired heart disease in children (coronary artery aneurysm) CNS, GI tract, kidney, eyes	ASA, IVIG, baseline echo and repeat in 6 wk
<b>Measles</b>	Paramyxovirus Incubation 8-13 d Communicable 4 d pre-rash and post-rash	Morbiliform rash starts at hairline and spreads down to face/neck/trunk, desquamates (no palm or sole involvement) Prodrome: cough, coryza, conjunctivitis (3 Cs) Enanthem: Koplik spots (grey/white papules on buccal mucosa)	Otitis media, pneumonia, encephalitis, SJS, glomerular nephritis, myocarditis/pericarditis	Vitamin A, immunoglobulin, MMR vaccine
<b>Meningococemia</b>	<i>Neisseria meningitidis</i>	Purpuric and petechial rash ("stellate purpura with a central gunmetal-grey hue")	Hearing loss, intellectual disability, necrosis and loss of digits and/or limbs, septic shock, death	5-7 d course of 3rd generation cephalosporin
<b>Roseola</b>	HHV 6, HHV 7 Incubation 5-15 d	Pink macules and papules on neck/arms/trunk ± face Eruption after high fever ends Posterior cervical nodes Enanthem: Nagayama sign (red papules on soft palate)	Febrile seizures, neurological involvement Viral reactivation in immunosuppressed patients	Supportive treatment Antipyretics during the febrile period
<b>Rubella</b>	RNA virus of the Togaviridae family Incubation 14-21 d Communicable 7 d pre-rash and post-rash	1-5 d following mild prodrome (fever, headache, respiratory symptoms), a pink maculopapular rash erupts on face spreading down to neck/trunk Occipital and retroauricular nodes	STAR complex Congenital rubella (cataract, glaucoma, thrombocytopenia, hepatitis, deafness, congenital heart disease)	Supportive treatment MMR vaccine Serologic testing in rubella-exposed pregnant women
<b>Scarlet Fever</b>	GAS toxin types A, B, and C Late fall, winter, and early spring	Generalized rash, red papules, "sand-paper" texture, desquamation (palms and soles), flexural accentuation (Pastia's lines) Enanthem: strawberry tongue, petechiae on palate	Mastoiditis, otitis, sinusitis, pneumonia, meningitis, myocarditis, arthritis, hepatitis, rheumatic fever, and glomerulonephritis	10-14 d course of penicillin

## Miscellaneous Lesions

### Angioedema and Urticaria

#### Angioedema

- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
  - triggers: minor trauma, emotional upset, temperature changes
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

#### Urticaria

- also known as "hives"; see Table 26 for classification
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

#### Wheal

- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

Table 26. Classification of Urticaria

Type	Etiology
<b>Acute Urticaria</b> >2/3 of cases Attacks last <6 wk Individual lesions last <24 h	Drugs: especially ASA, NSAIDs Foods: nuts, shellfish, eggs, fruit Idiopathic (vast majority) Infection Insect stings (bees, wasps, hornets) Percutaneous absorption: cosmetics, work exposures Stress Systemic diseases: SLE, endocrinopathy, neoplasm
<b>Chronic Urticaria</b> <1/3 of cases Attacks last >6 wk Individual lesion lasts <24 h	IgE-dependent: trigger associated Idiopathic (90% of chronic urticaria patients) Aeroallergens Drugs (antibiotics, hormones, local anesthetics) Foods and additives Insect stings Parasitic infections Physical contact (animal saliva, plant resins, latex, metals, lotions, soap) Direct mast cell release Opiates, muscle relaxants, radio-contrast agents Complement-mediated Serum sickness, transfusion reactions Infections, viral/bacterial (>80% of urticaria in pediatric patients) Urticarial vasculitis Arachidonic acid metabolism ASA, NSAIDs Physical Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), aquagenic (exposure to water), adrenergic (stress), heat Other Mastocytosis, urticaria pigmentosa
<b>Urticarial Vasculitis</b> Individual lesions last >24 h Often painful, less likely pruritic, heals with bruise type lesions Requires biopsy	Idiopathic Infections Hepatitis Autoimmune diseases SLE Drug hypersensitivity cimetidine and diltiazem

**DDx for Urticaria****DAM HIVES**

Drugs and foods  
Allergic  
Malignancy  
Hereditary  
Infection  
Vasculitis  
Emotions  
Stings

**Approach to Urticaria**

- Thorough Hx and P/E
- **Acute:** if individual lesions last <24 h, but attacks last <6 wk; no immediate investigations needed; consider referral for allergy testing
- **Chronic:** if individual lesions last <24 h but attacks last >6 wk; further investigations required: CBC and differential, urinalysis, ESR, TSH  
LFTs to help identify underlying cause
- **Vasculitic:** if individual lesions last >24 h; biopsy of lesion and referral to dermatology

**Mastocytosis (Urticaria Pigmentosa)**

Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier's sign), due to mast cell degranulation. This occurs within minutes.

## Erythema Nodosum

**Clinical Presentation**

- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs, knees, arms, (typically shins)
- associated with arthralgia, fever, malaise

**Etiology**

- 40% are idiopathic
- drugs: sulfonamides, oral contraceptives (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, Yersinia
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

**Epidemiology**

- 15-30 yr old, F:M = 3:1
- lesions last for days and spontaneously resolve in 6 wk

**Investigations**

- chest x-ray (to rule out chest infection and sarcoidosis)
- throat culture, antistreptolysin (ASO) titre, purified protein derivative (PPD) skin test

**Management**

- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause

**DDx of Erythema Nodosum****NODOSUMM**

No cause (idiopathic) in 40%  
Drugs (sulfonamides, OCP, etc.)  
Other infections (GAS+)  
Sarcoidosis  
Ulcerative colitis and Crohn's  
Malignancy (leukemia, Hodgkin's lymphoma)  
Many Infections

## Pruritus

### Clinical Presentation

- a sensation provoking a desire to scratch
- pruritus can present with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

### Etiology

- dermatologic – generalized
  - asteatotic dermatitis (“winter itch” due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin’s lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkins lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrotoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

#### DDx of Pruritus

##### SCRATCHED

Scabies  
Cholestasis  
Renal  
Autoimmune  
Tumours  
Crazies (psychiatric)  
Hematology (polycythemia, lymphoma)  
Endocrine (thyroid, parathyroid, ↓ Fe)  
Drugs, Dry skin

### Investigations

- detailed history
- complete physical, including rectal and pelvic examination
- bloodwork: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture and serology for parasites

### Management

- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid sparing

## Wounds and Ulcers

- see [Plastic Surgery](#), PS8, PS15

## Common Medications

### Sunscreens and Preventative Therapy

#### Sunburn

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA, UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am to 4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

#### Key to a Wound that does Not Heal...

- Consider biopsy of any nonhealing wound to rule out cancer.

SPF = burn time with cream/burn time without cream

## Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-60 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride and melanin
    - ♦ all are effective against the UVA and UVB spectrum
  - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

## Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

### UV Radiation

#### UVA (320-400 nm): Aging

- Penetrates skin more effectively than UVB or UVC
- Responsible for tanning, burning, wrinkling, photoallergy and premature skin aging
- Penetrates clouds, glass and is reflected off water, snow and cement

#### UVB (290-320 nm): Burning

- Absorbed by the outer dermis
- Is mainly responsible for burning and premature skin aging
- Primarily responsible for BCC, SCC
- Does not penetrate glass and is substantially absorbed by ozone

#### UVC (200-290 nm)

- Is filtered by ozone layer

### Body Site:

#### Relative Percutaneous Absorption

Forearm	1.0
Plantar foot	0.14
Palm	0.83
Back	1.7
Scalp	3.7
Forehead	6.0
Cheeks	13.0
Scrotum	42.0

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

### Side Effects of Topical Steroids

- Local: Atrophy  
Perioral dermatitis  
Steroid acne  
Rosacea  
Contact dermatitis  
Tachyphylaxis (tolerance)
- Systemic: Suppression of HPA axis

### Vehicles

- Ointment (water in oil): hydrate, greasy
- Cream (oil in water): hydrate, variable
- Lotion (powder in water): drying, cosmesis
- Solutions (water, alcohol, propylene glycol)
- Gel (solution that melts on contact with skin, alcohol): drying

## Topical Steroids

Table 27. Potency Ranking of Topical Steroids

Relative Potency	Relative Strength	Generic Names	Trade Names	Usage
Weak	x1	hydrocortisone 2.5% (1% available over-the-counter)	Emo Cort®	Intertriginous areas, children, face, thin skin
Moderate	x3	hydrocortisone 17-valerate – 0.2% desonide mometasone furorate	Westcort® Tridesilon® Elocom®	Arm, leg, trunk
Potent	x6	betamethasone – 0.1% 17-valerate – 0.1% amcinonide	Betnovate® Celestoderm – V® Cyclocort®	Body
Very Potent	x9	betamethasone dipropionate – 0.05% fluocinonide – 0.05% halcinonide	Diprosone® Lidex, Topsyn gel® Lyderm® Halog®	Palms and soles
Extremely Potent	x12	clobetasol propionate -0.05% (most potent) betamethasone dipropionate ointment halobetasol propionate -0.05%	Dermovate® Diprolene® Ultravate®	Palms and soles

## Dermatologic Therapies

Table 28. Common Topical Therapies

Drug Name	Dosing Schedule	Indications	Comments
Calcipotriol (Dovonex®)	0.005% cream, ointment, scalp solution, apply bid For maintenance therapy apply OD	Psoriasis	Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk > 14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)
Imiquimod (Aldara®)	5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk	Genital warts Cutaneous warts Actinic keratosis Superficial BCC	Avoid natural/artificial sun exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion

Table 28. Common Topical Therapies (continued)

Drug Name	Dosing Schedule	Indications	Comments
<b>Permethrin (Kwellada® P Lotion and Nix® Dermal Cream)</b>	5% cream, applied once overnight to all skin areas from neck down, repeated one week later	Scabies (Kwellada-P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)	Do not use in children <2 yr old Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider 2nd application after 7 d
<b>Pimecrolimus (Elidel®)</b>	1.0% cream bid Use for as long as lesions persist and discontinue upon resolution of symptoms	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive
<b>Tacrolimus topical (Protopic®)</b>	0.03% (children) or 0.1% (adults) ointment bid Continue for duration of disease PLUS x 1 wk after clearing	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive

Table 29. Common Oral Therapies

Drug Name	Dosing Schedule	Indications	Comments
<b>Acitretin (Soriatane®)</b>	25-50 mg PO OD; maximum 75 mg/d	Severe psoriasis Other disorders of hyperkeratinization (ichthyosis, Darier's disease)	<u>Monitoring strategies:</u> Monitor lipids, LFTs at baseline and q1-2wk until stable <u>Contraindications:</u> Women of childbearing potential unless strict contraceptive requirements are met <u>Drug interactions:</u> Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives May be combined with PUVA phototherapy (known as re-PUVA)
<b>Antivirals</b>	famcyclovir (Famvir®) 250 mg PO tid x 7-10 d (for 1st episode of genital herpes) 125 mg PO bid x 5 d (for recurrent genital herpes)  valacyclovir (Valtrex®) 1000 mg PO bid x 7-10 d (for 1st episode of genital herpes) 500 mg PO bid x 5 d (for recurrent genital herpes)	Chickenpox Herpes zoster Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis	<u>Side effects:</u> Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function  <u>Side effects:</u> Dizziness, depression, abdominal pain Reduce dose if impaired renal function <u>Drug interactions:</u> cimetidine
<b>Cyclosporin (Neoral®)</b>	2.5-4 mg/kg/d PO div bid Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg/d q2wks Concomitant dose of magnesium may protect the kidneys	Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD	<u>Monitoring strategies:</u> Blood pressure, renal function <u>Contraindications:</u> Abnormal renal function, uncontrolled hypertension, malignancy (except non-melanoma skin cancer), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long term effects preclude use of cyclosporin for >2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug
<b>Dapsone</b>	50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk	Dermatitis herpetiformis, neutrophilic dermatoses	<u>Monitoring strategies:</u> Obtain G6PD levels before initiating; in the initial two wk obtain methemoglobin levels and follow the blood counts carefully for the first few months <u>Side effects:</u> Neuropathy Hemolysis (Vitamin C and E supplementation can help prevent this) <u>Drug interactions:</u> Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours

Table 29. Common Oral Therapies (continued)

Drug Name	Dosing Schedule	Indications	Comments
<b>Isotretinoin</b> (Accutane®)	0.5-1 mg/kg/d given OD, to achieve a total dose of 120 mg/kg (20-24 wk)	Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne	<u>Monitoring strategies:</u> Baseline lipid profile and LFTs before treatment, $\beta$ -HCG <u>Contraindications:</u> Teratogenic – in sexually active females, 2 forms of reliable contraception necessary Generally regarded as unsafe in lactation <u>Side effects:</u> Night blindness, decreased tolerance to contact lenses, dry mucous membranes May transiently exacerbate acne, dry skin Depression, myalgia <u>Drug interactions:</u> Do not use at the same time as tetracycline or minocycline – both may cause pseudotumour cerebri Discontinue vitamin A supplements Drug may be discontinued at 16-20 wk when nodule count has dropped by >70%. A second course may be initiated after 2 mo pm Refractory cases may require >3 courses
<b>Itraconazole</b> (Sporanox®)	100-400 mg PO OD, depending on infection treated Tinea corporis/cruris: 200 mg PO OD x 7 d Tinea pedis: 200 mg PO bid x 7 d Tinea versicolor: 200 mg PO OD x 7 d Toenails with or without fingernail involvement: 200 mg PO bid x 7 d once per month, repeated 3x Fingernail involvement only: 200 mg bid PO x 7 d once per month, repeated 2x	Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis	<u>Contraindications:</u> CHF <u>Side effects:</u> Serious hepatotoxicity <u>Drug Interactions:</u> Inhibits CYP 3A4. Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs) Give capsules with food, capsules must be swallowed whole
<b>Ivermectin</b> (Mectizan®, Stromectol®)	200-250 $\mu$ g/kg PO qweekly x 2 Take once as directed; repeat one wk later	Onchocerciasis (USA only) Not licensed for use in Canada Also effective for: Scabies	No significant serious side effects Efficacious
<b>Methotrexate</b> (Trexall®)	10-25 mg qwk, PO, IM, or IV Max: 30 mg/wk To minimize side effects, administer with folic acid supplementation: 1-5 mg OD	Psoriasis AD Lymphomatoid papulosis May also be effective in: Cutaneous sarcoidosis	<u>Monitoring strategies:</u> Baseline renal, liver, and hematological studies <u>Contraindications:</u> Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy May be combined with cyclosporine to allow lower doses of both drugs
<b>Minocycline</b> (Minocin®)	50-100 mg PO bid Taper to 50 mg PO OD as acne lessens	Acne vulgaris Rosacea	<u>Contraindications:</u> Caution if impaired renal or liver function <u>Drug interactions:</u> Do not use with isotretinoin (Accutane®) <u>Side effects:</u> Extensive; affects multiple organ systems including CNS, teeth, eyes, bones, renal, and skin (photosensitivity, and blue pigmentation) Drug-induced lupus (check p-ANCA) Alternative to tetracycline
<b>Terbinafine</b> (Lamisil®)	250 mg PO OD x 2 wk Fingernails x 6 wk Toenails x 12 wk Confirm diagnosis prior to treatment	Onychomycosis Tinea corporis, cruris, pedis, capitis	<u>Contraindications:</u> Pregnancy, chronic or active liver disease <u>Drug interactions:</u> Potent inhibitor of CYP 2D6; use with caution when also taking $\beta$ -blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics Drug concentrates rapidly in skin, hair and nails at levels associated with fungicidal activity
<b>Tetracycline</b>	250-500 mg PO bid to tid Taken 1 h before or 2 h after a meal	Acne vulgaris Rosacea Bullous pemphigoid	<u>Contraindications:</u> Severe renal or hepatic dysfunction

DVT	deep venous thrombosis	NG	nasogastric	VBG	venous blood gas
ED	emergency department				

## Initial Patient Assessment/Management

### 1. Rapid Primary Survey (RPS)

- Airway maintenance with cervical spine (C-spine) control
  - Breathing and ventilation
  - Circulation (pulses, hemorrhage control)
  - Disability (neurological status)
  - Exposure (complete) and Environment (temperature control)
  - continually reassessed during secondary survey
- IMPORTANT:** always watch for signs of shock while doing primary survey (see Table 1)

#### A. AIRWAY

- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently

#### Airway Management

- permit adequate oxygenation and ventilation

#### 1. Basic Airway Management (Temporizing Measures)

- protect the C-spine
- head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

#### 2. Temporizing Measures

- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- “rescue” airway devices [e.g. laryngeal mask airway (LMA); Combitube®]
- transtracheal jet ventilation through cricothyroid membrane (last resort)

#### 3. Definitive Airway Management

- ETT intubation with in-line stabilization of C-spine (Figure 1)
  - orotracheal ± RSI preferred
  - nasotracheal – may be better tolerated in conscious patient
    - ♦ relatively contraindicated with basal skull fracture
  - does not provide 100% protection against aspiration
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
  - cricothyroidotomy

#### Contraindications to Intubation

- supraglottic/glottic pathology that would preclude successful intubation

#### Approach to the Critically Ill Patient

1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

Noisy breathing is obstructed breathing until proven otherwise.

#### Signs of Airway Obstruction

- Agitation, confusion, “universal choking sign”
- Respiratory distress
- Failure to speak, dysphonia
- Cyanosis

#### Medications that can be Delivered via ETT

**NAVEL**  
 Naloxone (Narcan®)  
 Atropine  
 Ventolin® (salbutamol)  
 Epinephrine  
 Lidocaine

#### Requirements for Clearing the C-Spine

- No midline tenderness
- No focal neurological deficits
- No distracting factors such as intoxication, altered LOC or distracting injuries

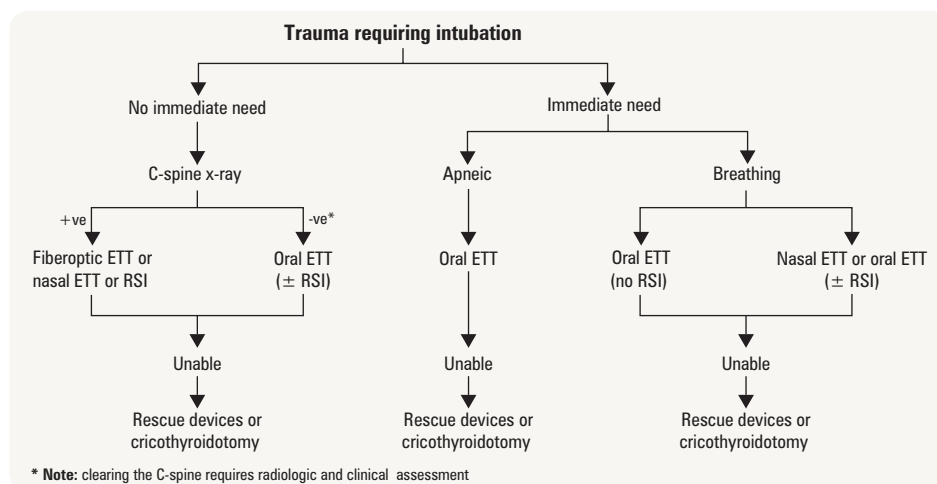

Figure 1. Approach to endotracheal intubation in an injured patient

## B. BREATHING

### • Look

- mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring

### • Listen

- auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping

### • Feel

- tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

## Breathing Assessment

- objective measures of respiratory function: rate, oximetry, arterial blood gas (ABG), A-a gradient

## Management of Breathing

- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing  $F_iO_2$ )
- Venturi mask: used to precisely control  $O_2$  delivery
- Bag-Valve mask and CPAP to supplement inadequate ventilation

## C. CIRCULATION

### Definition of Shock

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities) (see Table 2)

Table 1. Major Types of Shock

Hypovolemic	Cardiogenic	Distributive (vasodilation)	Obstructive
Hemorrhage (external and internal)	Myocardial ischemia	Septic	Cardiac tamponade
Severe burns	Dysrhythmias	Anaphylactic	Tension pneumothorax
High output fistulas	Congestive heart failure	Neurogenic (spinal cord injury)	Pulmonary embolism
Dehydration (diarrhea, DKA)	Cardiomyopathies		Aortic stenosis
	Cardiac valve problems		Constrictive pericarditis

### Clinical Evaluation

- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities and reduced central venous pressure (CVP)
- late: hypotension and altered mental status, reduced urine output

Table 2. Estimation of Degree of Hemorrhagic Shock

Class	I	II	III	IV
Blood loss	<750 cc	750-1500 cc	1500-2000 cc	>2000 cc
% of blood volume	<15%	15-30%	30-40%	>40%
Pulse	<100	>100	>120	>140
Blood pressure	Normal	Normal	Decreased	Decreased
Respiratory rate	20	30	35	>45
Capillary refill	Normal	Decreased	Decreased	Decreased
Urinary output	30 cc/h	20 cc/h	10 cc/h	None
Fluid replacement	Crystalloid	Crystalloid	Crystalloid + blood	Crystalloid + blood

### Indications for Intubation

- Unable to protect airway (e.g. Glasgow Coma Scale (GCS) <8; airway trauma)
- Inadequate oxygenation with spontaneous respiration ( $O_2$  saturation <90% with 100%  $O_2$  or rising  $pCO_2$ )
- Profound shock
- Anticipatory: in trauma, overdose, CHF, asthma, COPD and smoke inhalation injury
- Anticipated transfer of critically ill patients

### Rescue Techniques in Intubation

- Bougie (used like a guidewire)
- Glidescope®
- Lighted stylet (use light through skin to determine if ETT in correct place)
- Fiberoptic intubation – indirect visualization using fiberoptic cable

Shock in a trauma patient is hemorrhagic until proven otherwise.

### Signs of Fluid Depletion

- Increased heart rate
- Postural changes in vital signs
- Decreased urine output
- Hypotensive
- Decreased skin turgor
- Sunken eyes
- Decreased capillary refill

### Causes of Shock

#### SHOCKED

Septic, spinal/neurogenic, Hemorrhagic

Obstructive (e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism)

Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)

anaphylactic

Endocrine (e.g. Addison's, myxedema, coma)

Drugs

### Estimated Systolic Blood Pressure Based on Position of Most Distal Palpable Pulse

	sBP (mmHg)
Radial	>80
Femoral	>70
Carotid	>60

## Management of Hemorrhagic Shock

- ABCs
- diagnose and manage underlying cause
- if bleeding externally, apply direct pressure and elevate extremities if possible
  - do not remove impaled objects as they tamponade hemorrhage
  - tourniquet as a last resort
- resuscitation
  - infuse 1-2 L of crystalloid with large bore IVs (warmed if possible)
  - if inadequate response, consider active internal bleeding (e.g. chest, abdomen, pelvis, femurs), will likely require surgical intervention
  - if severely hypotensive on arrival or if shock persists, consider pRBC transfusion
  - transfuse crossmatched (ideally) or type-specific blood if available
  - if unavailable, transfuse O-negative in children/women of child bearing age or O-positive in all others
  - with significant blood loss, early transfusion of platelets and FFP may improve outcomes

## D. DISABILITY

- assess level of consciousness by AVPU method or GCS (Table 3)

## Glasgow Coma Scale (GCS)

- for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated and used for monitoring of trend
- change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3 part score: Eyes + Verbal + Motor = Total (see Table 3)
- if patient intubated, GCS score reported out of 10 + T (T= tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

Eyes Open		Best Verbal Response		Best Motor Response	
Spontaneously	4	Answers questions appropriately	5	Obeys commands	6
To voice	3	Confused, disoriented	4	Localizes to pain	5
To pain	2	Inappropriate words	3	Withdraws from pain	4
No response	1	Incomprehensible sounds	2	Decorticate (flexion)	3
		No verbal response	1	Decerebrate (extension)	2
				No response	1

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury

See Table 30 for modified GCS for infants and children

## E. EXPOSURE/ENVIRONMENT

- undress patient completely and assess entire body for injury; logroll to examine back
- digital rectal exam
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

### Fluid Resuscitation

- Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
- 0-10 kg: 4 cc/kg/h
- 10-20 kg: 2 cc/kg/h
- Remaining weight: 1 cc/kg/h
- Replace ongoing losses and deficits (assume 10% of body weight)

### 3:1 Rule

Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss.

### Initial Management of Any Patient in Shock

- ABCs
- IV fluids
- Oxygen
- Monitor (HR, BP, urine, mentation, O<sub>2</sub> saturation)
- Control hemorrhage

### Vasopressin versus Norepinephrine Infusion in Patients with Septic Shock

NEJM 2008;358:877-887

**Study:** Multicentre, randomized, double-blind trial

**Patients:** 778 patients with septic shock

**Intervention:** Low-dose vasopressin (0.01 to 0.03 U per minute) or norepinephrine (5 to 15 ug per minute) in addition to open-label vasopressors and a minimum of 5 ug of norepinephrine.

**Outcome:** Mortality rate 28 d after start of infusions.

**Results:** No significant difference between the vasopressin and the norepinephrine groups at 28 d or 90 d. However, in patients with less severe septic shock, mortality rate was lower in the vasopressin group.

### Contraindications to Foley insertion

- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

## 2. Resuscitation

- done concurrently with primary survey
- attend to ABCs (see Table 4)
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP and O<sub>2</sub> monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

Table 4. 2010 AHA CPR Guidelines

Step/Action	Adult: >8 years	Child: 1-8 years	Infant: <1 year
Airway	Head tilt-chin lift		
Breaths	2 breaths at 1 second/breath – stop once see chest rise		
Foreign-body airway obstruction	Abdominal thrust		Back slaps and chest thrusts
<b>Compressions</b>			
Compression landmarks	In the centre of the chest, between nipples		Just below nipple line
Compression method: push hard and fast and allow for complete recoil	2 hands: heel of 1 hand with second hand on top	2 hands: heel of 1 hand with second on top, or 1 hand: heel of 1 hand only	2 fingers, or thumbs
Compression depth	At least 2 inches	About 1/3 to 1/2 the depth of the chest	
Compression rate	100/min		
Compression-ventilation ratio	30 compressions to 2 ventilations		
Compression-only CPR	Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only		
<b>Defibrillation</b>	Immediate defibrillation for all rescuers responding to a sudden witnessed collapse Compressions (5 cycles/2 min) before AED is considered if unwitnessed arrest Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available		

**NG Tube Contraindications**

- Significant mid-face trauma
- Basal skull fracture

See [Anesthesia](#), A28 for 2012 ACLS Guidelines.

## 3. Secondary Survey

- done after rapid primary survey problems have been addressed
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, pelvis – required in blunt trauma, consider T-spine and L-spine)

### HISTORY

- “SAMPLE”: Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

### PHYSICAL EXAMINATION

#### Head and Neck

- pupils
  - assess equality, size, symmetry, reactivity to light
    - ♦ inequality/sluggish suggests local eye problem or lateralizing CNS lesion
    - ♦ relative afferent pupillary defect (swinging light test) – optic nerve damage
    - ♦ extraocular movements and nystagmus
    - ♦ fundoscopy (papilledema, hemorrhages)
  - reactive pupils + decreased LOC → metabolic or structural cause
  - non-reactive pupils + decreased LOC → structural cause (especially if asymmetric)
- palpation of facial bones, scalp

#### Chest

- inspect for midline trachea, flail segment:  $\geq 2$  rib fractures in  $\geq 2$  places; if present look for associated hemothorax, pneumothorax, and contusions
- auscultate lung fields
- palpate for subcutaneous emphysema
- CXR

#### Abdomen

- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- FAST or CT (if stable)
- rectal exam for GI bleed, high riding prostate and anal tone (best to do during the log roll)
- bimanual exam in females as appropriate

#### Musculoskeletal (MSK)

- examine all extremities for swelling, deformity, contusion, tenderness, ROM
- check for pulses and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis, pelvic stability (lateral, AP, vertical)
- pelvic x-ray

**Unilateral, Dilated, Non-reactive Pupil, think:**

- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

Non-contrast head CT is the best imaging modality for intracranial injury.

**Signs of Increased Intracranial Pressure (ICP)**

- Deteriorating LOC (hallmark)
- Deteriorating respiratory pattern
- Cushing reflex (high BP, low heart rate, irregular respirations)
- Lateralizing CNS signs (e.g. cranial nerve palsies, hemiparesis)
- Seizures
- Papilledema (occurs late)
- Nausea/vomiting and headache

## Neurological

- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities
  - progressive deterioration of breathing pattern implies a failing CNS
- assess spinal cord integrity
  - conscious patient: assess distal sensation and motor
  - unconscious patient: response to painful or noxious stimulus applied to extremities

## Ethical Considerations

### Consent to Treatment: Adults

- see [Ethical, Legal and Organizational Aspects of Medicine](#), ELOAM5
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible OR b) would increase risk to the patient
  - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- exceptions to the Emergency Rule: treatment cannot be initiated if
  - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient's wishes have changed
  - an advanced directive is available – e.g. do not resuscitate (DNR) order
  - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
  - care can be withdrawn if necessary at a later time or if wishes are clarified by family

### Consent to Treatment: Children

- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions
- if parents refuse treatment that is life-saving or will potentially alter the child's quality of life, Children's Aid Society (CAS) must be contacted – consent of CAS is needed to treat

### Other Issues of Consent

- need consent for HIV testing, as well as for administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

### Duty to Report

- law may vary depending on province and/or state
- examples: gunshot wounds, potential drunken drivers, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others

#### Jehovah's Witnesses

- Capable adults have the right to refuse medical treatment
- May refuse whole blood, pRBCs, platelets and plasma even if life-saving
- Should be questioned directly about the use of albumin, immunoglobulins, hemophilic preparations
- Do not allow autologous transfusion unless there is uninterrupted extra corporeal circulation
- Usually ask for the highest possible quality of care without the use of the above interventions (e.g. crystalloids for volume expansion, attempts at bloodless surgery)
- Patient will generally sign hospital forms releasing medical staff from liability
- Most legal cases involve children of Jehovah's Witnesses; if life-saving treatment is refused contact CAS

## Traumatology

- epidemiology
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: lethal injuries, death usually at the scene
  - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, etc.
- injuries fall into two categories
  - blunt (most common): motor vehicle collision (MVC), pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

## Considerations for Traumatic Injury

- important to know the mechanism of injury in order to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about head injury, loss of consciousness, amnesia, vomiting, headache and seizure activity

**Table 5. Mechanisms and Considerations of Traumatic Injuries**

Mechanism of Injury	Special Considerations	Associated Injuries
<b>Motor Vehicle Collision</b>	Vehicle(s) involved: weight, size, speed, damage Location of patient in vehicle Use and type of seatbelt Ejection of patient from vehicle Entrapment of patient under vehicle Airbag deployment Helmet use in motorcycle collision	Head-on collision: head/face, thoracic (aortic), lower extremity, Lateral/T-bone collision: head, cervical spine, thoracic, abdominal, pelvic and lower extremity. Rear-end collision: hyper-extension of cervical spine (whiplash injury) Rollover
<b>Pedestrian-Automobile Impact</b>	High morbidity and mortality Vehicle speed is an important factor Site of impact on car	Children at increased risk of being run over (multisystem injuries) Adults tend to be struck in lower legs (lower extremity injuries), impacted against car (truncal injuries) and thrown to ground (head injuries)
<b>Falls</b>	1 storey = 12 feet = 3.6 m Distance of fall: 50% mortality at 4 stories and 95% mortality at 7 stories Landing position (vertical vs. horizontal)	Vertical: lower extremity, pelvic and spine fractures. Head injuries Horizontal: facial, upper extremity and rib fractures. Abdominal, thoracic and head injuries
<b>Gunshot Wounds (GSW)</b>	Type of gun Type of ammunition Range of shot Characterize route of entry, even or odd number of wounds and site of exit wound (if any) $KE = 1/2 mv^2$	Injuries dependent on location of GSW and underlying structures Hand gun: low/medium velocity, extent of injury may be limited to small area Hunting rifle: high velocity, widespread injury Shotgun: widespread tissue destruction at close range, massive tissue destruction, deposition of wadding into wound
<b>Stab Wounds (SW)</b>	Route/direction of entry Length of blade Type of penetration (stab, slash, impalement) If blade in-situ, DO NOT REMOVE – may be tamponading vessel (to be removed in OR)	Injuries dependent on location of SW and underlying structures

### High Risk Injuries

- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height > 12 ft (3.6 m)

### Vehicle vs. Pedestrian Crash

In adults look for triad of injuries (Waddle's triad):

- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

**Cardiac box:** sternal notch, nipples and xiphoid process; injuries inside this area should increase suspicion of cardiac injury.

Always completely expose and count the number of wounds.

## Head Trauma

- see [Neurosurgery](#), NS30
- 60% of trauma admissions have head injuries
- 60% of MVC-related deaths are due to head injury

### Specific Injuries

- **fractures**
  - Dx: non-contrast head CT and physical exam
- A. skull fractures
  - vault fractures
    - ♦ linear, non-depressed
      - most common
      - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
    - ♦ depressed
      - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
  - basal skull
    - ♦ typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
    - ♦ clinical diagnosis superior as poorly visualized on CT (Battle's sign, raccoon eyes, CSF rhinorrhea/otorrhea, hemotympanum)
- B. facial fractures (see [Plastic Surgery](#), PL28)
  - neuronal injury
  - beware of open fracture or sinus fractures (risk of infection)
  - unstable or displaced fractures (need semi-urgent plastics referral)
  - severe facial fractures may pose risk to airway from profuse bleeding

Falls and MVCs are the leading cause of head trauma.

### Signs of Basal Skull Fracture

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF Rhinorrhea/Otorrhea

- **scalp laceration**

- can be a source of significant bleeding
- achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)

- **neurological injury**

- A. diffuse

- mild traumatic brain injury = concussion
  - ♦ transient alteration in mental status that may involve loss of consciousness
    - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
    - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15 and post-traumatic amnesia must be less than 24 h
- diffuse axonal injury
  - ♦ mild: coma 6-24 h, possibly lasting deficit
  - ♦ moderate: coma >24 h, little or no signs of brainstem dysfunction
  - ♦ severe: coma >24 h, frequent signs of brainstem dysfunction

- B. focal injuries

- contusions
- intracranial hemorrhage (epidural, subdural, intracerebral)

**Warning Signs of Severe Head Injury**

- GCS <8
  - Deteriorating GCS
  - Unequal pupils
  - Lateralizing signs
- N.B.** Altered LOC is a hallmark of brain injury

**ASSESSMENT OF BRAIN INJURY****History**

- pre-hospital status
- mechanism of injury

**Physical Examination**

- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing's response to increasing ICP (bradycardia, hypertension, irregular respirations)
- severity of injury determined by
  1. LOC
    - ♦ GCS ≤8 intubate, any change in score of 3 or more = serious injury
    - ♦ mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
    - ♦ may become more subtle with increasing severity of injury
- reassess frequently

**Investigations**

- labs: CBC, electrolytes, PT/PTT or INR/PTT, glucose, toxicology screen
- CT scan (non-contrast) to exclude intracranial mass lesions
- C-spine imaging, often with CT head and neck to exclude intracranial mass lesions

**Management**

- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
  - medical management
    - ♦ seizure treatment/prophylaxis
      - benzodiazepines, phenytoin, phenobarbital
      - steroids are of no proven value
    - ♦ treat suspected raised ICP → consider if head injury with signs of increased ICP:
      - raise head of stretcher 20° if patient hemodynamically stable
      - intubate and hyperventilate (100% O<sub>2</sub>) to a pCO<sub>2</sub> of 30-35 mmHg
      - mannitol 1g/kg infused as rapidly as possible (contraindicated in shock and renal failure/anuria)
      - consider paralyzing medications if agitated/high airway pressures
      - maintenance of CPP is critical (CPP=MAP-ICP)

**Disposition**

- neurosurgical ICU admission for severe head injuries (HI)
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor head injury not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits

**Canadian CT Head Rule**

*Lancet 2001;357:1391-1396*

**CT Head is only required for patients with minor head injuries with any one of the following:**

**High risk** (for neurological intervention)

- GCS score <15 at 2 h after injury
- Suspected open or depressed skull fracture
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, cerebrospinal fluid otorrhea/rhinorrhea, Battle's sign)
- Vomiting ≥2 episodes
- Age ≥65 yr

**Medium risk** (for brain injury on CT)

- Amnesia before impact >30 min (i.e. cannot recall events just before impact)
- Dangerous mechanism (pedestrian struck by motor vehicle, occupant ejected from motor vehicle, fall from height >3 feet or five stairs)

**Minor head injury** is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.

**NB:** Canadian CT head rule does not apply for non-trauma cases, for GCS <13, age <16, for patients on Coumadin® and/or having a bleeding disorder, or having an obvious open skull fracture

**Treatment of Increased ICP**

- Elevate head of bed
- Mannitol
- Hyperventilate
- Paralyzing/sedating agents

See also [Neurosurgery](#), NS6

## Mild Traumatic Brain Injury

### Epidemiology

- traumatic brain injury results in 1.7 million deaths, hospitalizations and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see [Neurosurgery](#), NS31)
- highest rates in children 0-4 yr, adolescents 15-19 yr and elderly >65 yr

### Clinical Features

- somatic: headache, sleep disturbance, nausea, vomiting, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

### Etiology

- falls, motor vehicle and traffic accidents, struck by an object, assault, sports

### Investigations

- neuro exam
- concussion recognition tool (see [thinkfirst.ca](#))
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

### Treatment

- close observation and follow-up; patients at risk of intracranial complications [give appropriate discharge instructions to patient and family] watch for changes to clinical features above, and if change, return to ER
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- early rehabilitation to maximize outcomes
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines: Cantu, Colorado Medical Society, American Academy of Neurology, 2008 Consensus Statement on Concussion in Sports – no data on superiority

### Prognosis

- most recover with minimal treatment
  - athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life threatening cerebral edema or permanent impairment

Extent of retrograde amnesia correlates with severity of injury.

**Collar everyone with at least one of the following criteria**

- Midline tenderness
- Neurological symptoms or signs
- Significant distracting injuries
- Head injury
- Intoxication
- Dangerous mechanism
- History of altered LOC

Patients with penetrating trauma (especially gunshot and knife wounds) can also have spinal cord injury.

Of the investigations, the lateral C-spine x-ray is the single most important film. 95% of radiologically visible abnormalities are found on this film.

Cauda Equina Syndrome can occur with any spinal cord injury below T10 vertebrae. Look for incontinence, anterior thigh pain, quadriceps weakness, abnormal sacral sensation, decreased rectal tone and variable reflexes.

**The Canadian C-spine Rule versus the NEXUS Low-risk Criteria in Patients with Trauma**  
*NEJM* 2003;349:2510-2518

**Purpose:** To compare the clinical performance of the Canadian C-Spine Rule (CCR) and the National Emergency X-Radiography Utilization Study (NEXUS) Low-Risk Criteria (NLC).

**Study:** Trauma patients (n=8283) in stable condition were prospectively evaluated by both the CCR and NLC by 394 physicians before radiography. 2% of these patients had a C-spine injury.

**Results:** Compared to the NLC, the CCR was more sensitive (99.4 vs. 90.7%) and more specific (45.1 vs. 36.8%) after exclusion of indeterminate cases. The number of missed patients would be 1 for the CCR and 16 for the NLC. The range of motion was not evaluated in some CCR cases likely because physicians were not comfortable with the procedure and this may slightly lower the sensitivity or specificity of the CCR in practice.

**Summary:** The CCR is superior to the NLC in alert and stable patients with trauma. The use of the CCR can result in lower radiography rates.

## Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (Figure 2)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (SCIWORA = spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

### History

- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

### Physical Exam

- ABCs
- abdo: ecchymosis, tenderness
- neuro: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; logroll, then palpate T-spine and L-spine spine; assess rectal tone
  - when palpating assess for tenderness, muscle spasm, bony deformities, step-off and spinous process mal-alignment
- extremities: check cap refill, suspect thoracolumbar injury with calcaneal fractures

### Investigations

- labs: CBC, electrolytes, creatinine, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
- thoracolumbar x-rays
  - AP and lateral views
  - indications:
    - patients with C-spine injury
    - unconscious patients (with appropriate mechanism of injury)
    - patients with neurological symptoms or findings

- ♦ patients with deformities that are palpable when patient logroll
- ♦ patients with back pain
- ♦ patients with bilateral calcaneal fractures (due to fall from height)
  - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
- consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate

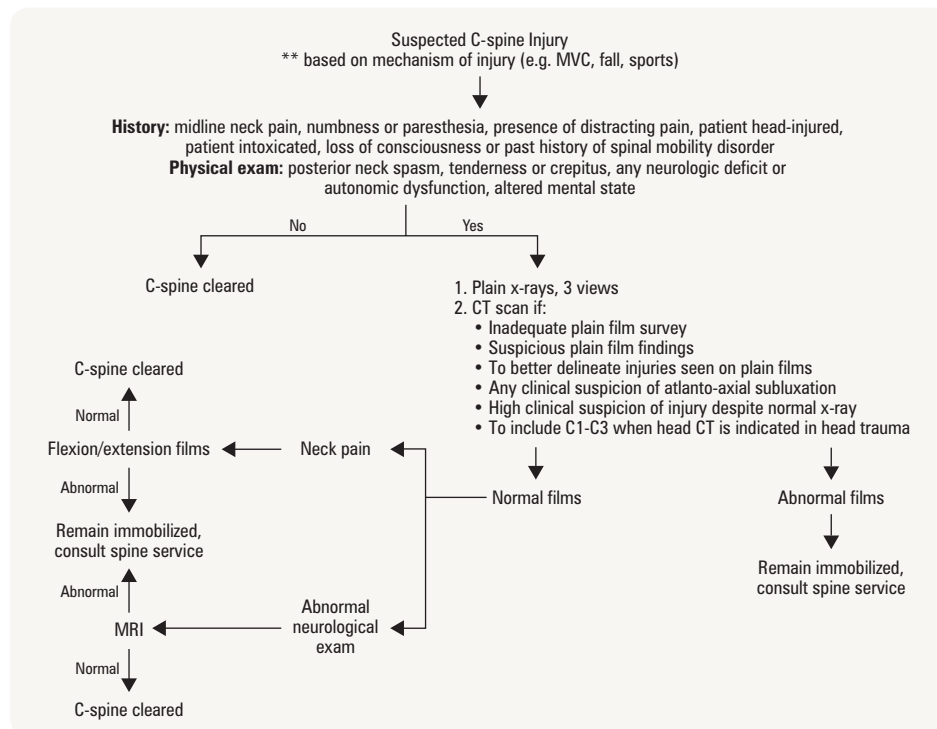

Figure 2. Approach to clearing the C-spine

### Can Clear C-spine if:

- no posterior midline cervical tenderness
- no evidence of intoxication
- oriented to person, place, time and event
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

### Management of Cord Injury

- immobilize
- evaluate ABCs
- treat shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- high dose steroids: methylprednisolone 30 mg/kg bolus, then 5.4 mg/kg/h drip, start within 6-8 h of injury (controversial and recently has less support)
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact)
  - high cervical cord injury (above C4) may require intubation and ventilation
- beware of hypotension (neurogenic shock)
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

### Approach to C-Spine X-Rays

- 3-view C-spine series is the screening modality of choice
  1. lateral C1-T1 ± swimmer's view (Figure 3, see Table 6 for interpretation)
    - ♦ lateral view is best, identifies 90-95% of injuries
  2. odontoid view (open mouth or oblique submental view) (see Figure 4)
    - ♦ examine the dens for fractures
    - if unable to rule out fracture, repeat view or consider CT or plain film tomography
    - ♦ examine lateral aspects of C1 and spacing relative to C2
  3. AP view
    - ♦ alignment of spinous processes in the midline
    - ♦ spacing of spinous processes should be equal
    - ♦ check vertebral bodies and facet dislocations

### The Canadian C-Spine Rule

JAMA 2001; 286:1841-1848

For Alert (Glasgow Coma Scale Score = 15) and Stable Trauma Patients where Cervical Spine (C-spine) injury is a concern

1. Any high-risk factor that mandates radiography?  
 Age ≥65 yr  
 or  
 Dangerous mechanism\*  
 or  
 Paresthesias in extremities

No

2. Any one low-risk factor that allows safe assessment of range of motion?  
 Simple rear-end MVC†  
 or  
 Sitting position in ED  
 or  
 Ambulatory at any time  
 or  
 Delayed onset of neck pain‡  
 or  
 Absence of midline C-spine tenderness

Yes

3. Able to actively rotate neck?  
 >45° left and right

Unable

Able

No radiography

\*Dangerous Mechanism:

- Fall from ≥1 meter/5 stairs
- Axial load to head e.g. diving
- MVC high speed (>100 km/h), rollover, ejection
- Motorized recreational vehicles
- Bicycle collision

†Simple rear-end MVC excludes:

- Pushed into oncoming traffic
- Hit by bus/large truck
- Rollover
- Hit by high-speed vehicle

‡Delayed: Not immediate onset of neck pain

Figure 3. Lines of contour on a lateral C-spine x-ray

Prevertebral soft tissue swelling is only 49% sensitive for injury.

## Supine Oblique Views

- rarely used
- better visualization of posterior element fractures (lamina, pedicle, facet joint)
- good to assess patency of neural foramina
- can be used to visualize the C7-T1 junction

**Table 6. Interpretation of Lateral View: The ABCS**

<b>A Adequacy and Alignment</b>	<ul style="list-style-type: none"> <li>• Must see C1 to C7-T1 junction; if not, downward traction of shoulders, swimmer's view, bilateral supine obliques, or CT scan needed</li> <li>• Lines of contour – in children &lt;8 yr of age: can see physiologic subluxation of C2 on C3, and C3 on C4, but the spino-laminal line is maintained</li> <li>• Fanning of spinous processes – suggests posterior ligamentous disruption</li> <li>• Widening of facet joints</li> <li>• Check atlanto-occipital joint:</li> <li>• Line extending inferiorly from clivus should transect odontoid</li> <li>• Atlanto-axial articulation – widening of predental space (normal: &lt;3 mm in adults, &lt;5 mm in children) indicates injury of C1 or C2</li> </ul>
<b>B Bones</b>	<ul style="list-style-type: none"> <li>• Height, width and shape of each vertebral body</li> <li>• Pedicles, facets, and laminae should appear as one – doubling suggests rotation</li> </ul>
<b>C Cartilage</b>	<ul style="list-style-type: none"> <li>• Intervertebral disc spaces – wedging anteriorly or posteriorly suggests vertebral compression</li> </ul>
<b>S Soft Tissues</b>	<ul style="list-style-type: none"> <li>• Widening of retropharyngeal (normal: &lt;7 mm at C1-4, may be wide in children &lt;2 yr on expiration) or retrotracheal spaces (normal: &lt;22 mm at C6-T1, &lt;14 mm in children &lt;5 yr)</li> </ul>

## Sequelae of C-spine Fractures

- see [Neurosurgery](#), NS 32
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
    - ♦ decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
    - ♦ watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
    - ♦ occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
    - ♦ provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
    - ♦ signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
    - ♦ common triggers
      - GU causes: bladder distention, urinary tract infection, and kidney stones
      - GI causes: fecal impaction or bowel distension
    - ♦ treatment: monitoring and controlling BP, prior to addressing causative issue

**Figure 4. C-spine x-ray; odontoid view**

In contrast to neurogenic shock, hypovolemic shock has hypotension and tachycardia.

Autonomic dysreflexia – a life threatening elevation of BP with SCI at or above T6.

20% of C-spine fractures are accompanied by other spinal fractures, so ensure thoracic and lumbar spine x-rays are normal before proceeding to OR.

Trauma to the chest accounts for 50% of trauma deaths.

80% of all chest injuries can be managed non-surgically with simple measures such as intubation, chest tubes, and pain control.

**3-way Seal for Open Pneumothorax (i.e. sucking chest wound)**  
Allows air to escape during the expiratory phase (so that you don't get a tension pneumothorax) but seals itself to allow adequate breaths during the inspiratory phase.

**Pulsus Paradoxus:** a drop in BP of >10 mmHg with inspiration. Recall that BP normally drops with inspiration, but what's "paradoxical" about this is that it drops more than it should.

## Chest Trauma

- two types: those found and managed in 1° survey and those found and managed in 2° survey (see Tables 7 and 8)

**Table 7. Life-Threatening Chest Injuries Found in 1° Survey**

	Physical Exam	Investigations	Management
<b>Airway Obstruction</b>	<ul style="list-style-type: none"> <li>• Anxiety, stridor, hoarseness, altered mental status</li> <li>• Apnea, cyanosis</li> </ul>	<ul style="list-style-type: none"> <li>• Do not wait for ABG to intubate</li> </ul>	<ul style="list-style-type: none"> <li>• Definitive airway management</li> <li>• Intubate early</li> <li>• Remove foreign body if visible with laryngoscope prior to intubation</li> </ul>
<b>Tension Pneumothorax</b>	<ul style="list-style-type: none"> <li>• Respiratory distress, tachycardia, distended neck veins, cyanosis, asymmetry of chest wall motion</li> <li>• Tracheal deviation away from pneumothorax</li> <li>• Percussion hyperresonance</li> <li>• Unilateral absence of breath sounds</li> </ul>	<ul style="list-style-type: none"> <li>• Non-radiographic diagnosis</li> </ul>	<ul style="list-style-type: none"> <li>• Needle thoracostomy – large bore needle, 2nd intercostal space (ICS) mid clavicular line, followed by chest tube in 5th ICS, anterior axillary line</li> </ul>

Table 7. Life-Threatening Chest Injuries Found in 1<sup>o</sup> Survey (continued)

	Physical Exam	Investigations	Management
<b>Open Pneumothorax</b> • Air entering chest from wound rather than trachea	• Gunshot or other wound (hole >2/3 tracheal diameter) ± exit wound • Unequal breath sounds	• ABG: decreased pO <sub>2</sub>	• Air-tight dressing sealed on 3 sides • Chest tube • Surgery
<b>Massive Hemothorax</b> • >1500 cc blood loss in chest cavity	• Pallor, flat neck veins, shock • Unilateral dullness • Absent breath sounds, hypotension	• Usually only able to do supine CXR – entire lung appears radioopaque as blood spreads out over posterior thoracic cavity	• Restore blood volume • Chest tube • Thoracotomy if: • >1500 cc total blood loss • ≥200 cc/h continued drainage
<b>Flail Chest</b> • Free-floating segment of chest wall due to >2 rib fractures, each at 2 sites • Underlying lung contusion (cause of morbidity and mortality)	• Paradoxical movement of flail segment • Palpable crepitus of ribs • Decreased air entry on affected side	• ABG: decreased pO <sub>2</sub> , increased pCO <sub>2</sub> • CXR: rib fractures, lung contusion	• O <sub>2</sub> + fluid therapy + pain control • Judicious fluid therapy in absence of systemic hypotension • Positive pressure ventilation • ± intubation and ventilation
<b>Cardiac Tamponade</b> • Clinical diagnosis • Pericardial fluid accumulation impairing ventricular function	• Penetrating wound (usually) • Beck's triad: hypotension, distended neck veins, muffled heart sounds • Tachycardia, tachypnea • Pulsus paradoxus • Kussmaul's sign (increased JVP with inspiration)	• Echocardiogram • Bedside ultrasound (FAST)	• IV fluids • Pericardiocentesis • Open thoracotomy

Table 8. Potentially Life-Threatening Chest Injuries Found in 2<sup>o</sup> Survey

	Physical Exam	Investigations	Management
<b>Pulmonary Contusion</b>	• Blunt trauma to chest • Interstitial edema impairs compliance and gas exchange	• CXR: areas of opacification of lung within 6 h of trauma	• Maintain adequate ventilation • Monitor with ABG, pulse oximeter and ECG • Chest physiotherapy • Positive pressure ventilation if severe
<b>Ruptured Diaphragm</b>	• Blunt trauma to chest or abdomen (e.g. high lap belt in MVC)	• CXR: abnormality of diaphragm/lower lung fields/ NG tube placement • CT scan and endoscopy – sometimes helpful for diagnosis	• Laparotomy for diaphragm repair and because of associated intra-abdominal injuries
<b>Esophageal Injury</b>	• Usually penetrating trauma (pain out of proportion to degree of injury)	• CXR: mediastinal air (not always) • Esophagram (Gastrografin®) • Flexible esophagoscopy	• Early repair (within 24 h) improves outcome but all require repair
<b>Aortic Tear</b> • 90% tear at subclavian (near ligamentum arteriosum), most die at scene • Salvageable if diagnosis made rapidly	• Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent) • Decreased femoral pulses, differential arm BP (arch tear)	• CXR, CT scan, transesophageal echo (TEE), aortography (gold standard) • See sidebar for CXR features	• Thoracotomy (may treat other severe injuries first)
<b>Blunt Myocardial Injury (rare)</b>	• Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose) • Physical examination: overlying injury, e.g. fractures, chest wall contusion	• ECG: dysrhythmias, ST changes • Patients with a normal ECG and normal hemodynamics never get dysrhythmias	• O <sub>2</sub> • Antidysrhythmic agents • Analgesia

## Other Potentially Life-Threatening Injuries Related to the Chest

### Penetrating Neck Trauma

- includes all penetrating trauma to the three zones of the neck (Figure 5)
- management: injuries deep to platysma require further evaluation by angiography, contrast CT or surgery
- do not explore penetrating neck wounds except in the OR

### Airway Injuries

- always maintain a high index of suspicion

### DDx of Life Threatening Chest Injuries

#### HOT and FAT CHEST

Hemothorax\*  
Open pneumothorax  
Tension pneumothorax\*

Flail chest  
Airway obstruction  
Tamponade\*

Contusion: pulmonary, myocardial  
Hernia: traumatic, diaphragmatic  
ESophageal perforation  
Tracheobronchial disruption/  
Traumatic injury/Thoracic Aorta Rupture\*

\*Rapidly Life Threatening

Ruptured diaphragm is more often diagnosed on the left side, as liver conceals right side defect.

### Aortic Tear: ABC WHITE

x-ray features of Aortic tear  
depressed left mainstem Bronchus  
pleural Cap  
Wide mediastinum (most consistent)  
Hemothorax  
Indistinct aortic knuckle  
Tracheal deviation to right side  
Esophagus (NG tube) deviated to right

(Note: present in 85% of cases, but cannot rule out)

### If Penetrating Neck Trauma Present, DON'T:

- Clamp structures (can damage nerves)
- Probe
- Insert NG tube (leads to bleeding)
- Remove weapon/impaed object

Figure 5. Zones of the neck in trauma

- larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
  - triad: hoarseness, subcutaneous emphysema, palpable fracture crepitus
  - other symptoms: hemoptysis, dyspnea, dysphonia
  - investigations: CXR, CT scan, arteriography (if penetrating)
  - management
    - ♦ airway: manage early because of edema
    - ♦ C-spine may also be injured, consider mechanism of injury
    - ♦ surgical: tracheotomy vs. repair
- trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intra-thoracic pressure; complaints of dyspnea, hemoptysis
  - examination: subcutaneous air, Hamman's sign (crunching sound synchronous with heart beat)
  - CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
  - management: surgical repair if >1/3 circumference

## Abdominal Trauma

- two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = 2<sup>nd</sup>)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

### BLUNT TRAUMA

- results in two types of hemorrhage: intra-abdominal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

### History

- mechanism of injury, SAMPLE history

### Physical Exam

- often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - other injuries may mask symptoms
  - serial examinations are required
- abdomen
  - inspect: contusions, abrasions, seatbelt sign, distention
  - auscultate: bruits, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG, Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

### Investigations

- labs: CBC, electrolytes, coagulation, cross and type, glucose, creatinine, CK, lipase, amylase, liver enzymes, ABG, blood EtOH,  $\beta$ -hCG, U/A, toxicology screen
- imaging: see Table 9

**Table 9. Imaging in Abdominal Trauma**

Imaging	Strengths	Limitations
<b>X-Ray</b>	Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines	Soft tissue not well visualized
<b>CT scan</b>	Most specific test	Radiation exposure 20x more than x-ray Cannot use if hemodynamic instability
<b>Diagnostic Peritoneal Lavage (DPL) (rarely used)</b>	Most sensitive test Tests for intra-peritoneal bleed	Cannot test for retroperitoneal bleed or diaphragmatic rupture Cannot distinguish lethal from trivial bleed Results can take up to 1 h
<b>Ultrasound: FAST</b>	Identifies presence/absence of free fluid in peritoneal cavity RAPID exam: less than 5 min Can also examine pericardium and pleural cavities	NOT used to identify specific organ injuries If patient has ascites, FAST will be falsely positive

#### Seatbelt Injuries may Cause:

- Retroperitoneal duodenal trauma
- Intraperitoneal bowel transection
- Mesenteric injury
- L-spine injury

#### Indications for Foley and NG Tube in Abdominal Trauma

Foley catheter: unconscious or patient with multiple injuries who cannot void spontaneously.  
Contraindications: blood at the meatus, an ecchymotic scrotum, or a "high-riding" prostate on DRE (retrograde cystourethrogram is indicated to rule out a urethral tear or ruptured bladder).

NG tube: used to decompress the stomach and proximal small bowel.  
Contraindications: facial fractures or basal skull fractures suspected.

#### Criteria for Positive Lavage

- > 10 cc gross blood
- Bile, bacteria, foreign material
- RBC count > 100,000  $\times 10^6/L$
- WBC > 500  $\times 10^6/L$ , amylase > 175 IU

- imaging must be done if
  - equivocal abdominal examination, suspected intra-abdominal injury or distracting injuries
  - multiple trauma patient resulting in unreliable physical exam (altered sensorium, secondary to drugs, alcohol, head trauma, or distracting injury; spinal cord injury resulting in abdominal anesthesia)
  - unexplained shock/hypotension
  - multiple trauma patients who must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
  - fractures of lower ribs, pelvis, spine
  - positive FAST

### Management

- general: ABCs, fluid resuscitation and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

### PENETRATING TRAUMA

- high risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

### Management

- general: ABCs, fluid resuscitation and stabilization
- gunshot wounds → always require laparotomy

#### Laparotomy is mandatory if penetrating trauma and:

- Shock
- Peritonitis
- Evisceration
- Free air in abdomen
- Blood in NG tube, Foley catheter, or on rectal exam

#### "Rule of Thirds" for stab wounds:

- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

## Genitourinary Tract Injuries

- see [Urology](#), U32

### Etiology

- blunt trauma: often associated with pelvic fractures
  - upper tract
    - ♦ renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ♦ ureter: rare, at uretero-pelvic junction
  - lower tract
    - ♦ bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - ♦ urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
- penetrating trauma
  - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
  - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
  - ureter and urethra (from instrumentation)

### History

- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

Gross hematuria suggests bladder injury.

## Physical Examination

- abdominal pain, flank pain, costovertebral angle (CVA) tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures

## Investigations

- urethra: retrograde urethrography
- bladder: urinalysis, CT scan, urethrogram, ± retrograde cystoscopy, ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram (IVP)

## Management

- urology consult
- renal
  - minor injuries: conservative management
    - ♦ bedrest, hydration, analgesia, antibiotics
  - major injuries: admit
    - ♦ conservative management with frequent reassessments, serial urinalysis, ± re-imaging
    - ♦ surgical repair (exploration, nephrectomy): e.g. hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - uretero-uretostomy
- bladder
  - extraperitoneal
    - ♦ minor rupture: Foley drainage x 10-14 d
    - ♦ major rupture: surgical repair
  - intraperitoneal
    - ♦ drain abdomen and surgical repair
- urethra
  - anterior: conservative, if cannot void → Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

In the case of gross hematuria, the GU system is investigated from distal to proximal (i.e. urethrogram, cystogram, etc.).

## Orthopedic Injuries

- see [Orthopedics](#) (Shoulder OR10, Knee, OR29 Wrist OR19, Ankle OR35)

## Goals of ED Treatment

- diagnose potentially life/limb threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

## History

- use SAMPLE
- mechanism of injury may be very important

## Physical Examination

- look (inspection): “SEADS” Swelling, Erythema, Atrophy, Deformity, Skin changes (e.g. bruises)
- feel (palpation): all joints/bones – local tenderness, swelling, warmth, crepitus, joint effusions, subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

### Description of Fractures

#### SOLARTAT

Site  
Open vs. closed  
Length  
Articular  
Rotation  
Translation  
Alignment/Angulation  
Type (e.g. Salter-Harris, etc.)

## LIFE AND LIMB THREATENING INJURIES

**Table 10. Life and Limb Threatening Orthopedic Injuries**

Life Threatening Injuries (usually blood loss)	Limb Threatening Injuries (usually interruption of blood supply)
Major pelvic fractures	Fracture/dislocation of ankle (talar AVN)
Traumatic amputations	Crush injuries
Massive long bone injuries (beware of fat emboli)	Compartment syndrome
Vascular injury proximal to knee/elbow	Open fractures
	Dislocations of knee/hip
	Fractures above knee/elbow

### Open Fractures

- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- must secure definitive surgical care within 6-8 h

### Vascular Injuries

- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

### Compartment Syndrome

- increased interstitial pressure in an anatomical “compartment” (forearm, calf) with little room for expansion, resulting in decreased perfusion and potential muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - look for “the 6 Ps” (see side bar)
- requires prompt decompression: remove constrictive casts, dressings; fasciotomy may be needed emergently

## UPPER EXTREMITY INJURIES

- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
    - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with ortho
    - with forceful injury, look for fracture
- Colles' fracture (Figure 6)
  - distal radius fracture with dorsal displacement from Fall On an Outstretched Hand (FOOSH)
  - AP film: shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with ortho or immediate orthopedic referral if complicated fracture
  - if involvement of articular surface, emergent orthopedic referral
- scaphoid fracture (see Figure 7 for review of carpal bones)
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, re-x-ray in 1 wk ± bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, re-x-ray in 2 wk
  - risk of AVN of scaphoid if not immobilized
  - outpatient ortho follow-up

## LOWER EXTREMITY INJURIES

- ankle and foot fractures
  - see Ottawa Ankle and Foot Rules (Figure 8)
- knee injuries
  - see Ottawa Knee Rules (Figure 9)

### Reasons for Emergent Orthopedic Consultation

- Compartment syndrome
- Irreducible dislocation
- Circulatory compromise
- Open fracture
- Injury requiring surgical repair

### When Dealing with an Open Fracture, Remember “STAND”

**S**plint  
**T**etanus prophylaxis  
**A**ntibiotic  
**N**eurovascular status (before and after)  
**D**ressings (to cover wound)

Vascular injury/compartment syndrome is suggested by “The 6 Ps”:

**P**ulse discrepancies  
**P**allor  
**P**aresthesia/hypoesthesia  
**P**aralysis  
**P**ain (especially when refractory to usual analgesics)  
**P**olar (cold)

**Figure 6. Colles' fracture**

**Figure 7. Carpal bones**

**Figure 8. Ottawa Ankle and Foot Rules**

Adapted from Stiell et. al. JAMA 1994;271:827-832

- avulsion of the base of 5th metatarsal
  - occurs with inversion injury
  - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated injuries may involve ankles, knees, hips, pelvis, lumbar spine

**A knee x-ray examination is required only for acute injury patients with one or more of:**

- Age 55 yrs or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the emergency department (four steps)

**Figure 9. Ottawa Knee Rules**

Adapted from: Stiell et. al. JAMA 1997; 278:2075-2079

## Wound Management

### Goals of ED Treatment

- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration (history and physical)
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

### Tetanus Prophylaxis

- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

**Table 11. Guidelines for Tetanus Prophylaxis for Wounds**

Immunization History	Non Tetanus Prone Wounds		Tetanus Prone Wounds <sup>1</sup>	
	Td <sup>2</sup>	TIG <sup>3</sup>	Td	TIG
Uncertain or <3 doses	Yes	No	Yes	Yes
3 or more, none for >10 yr	Yes	No	Yes	No
3 or more, 5 to 10 yr ago	No	No	Yes	No
3 or more, <4 yr ago	No	No	No	No

<sup>1</sup> wounds >6 h old, >1 cm deep, puncture wounds, avulsions, wounds resulting from missiles, crush wounds, burns, frostbite, wounds contaminated with dirt, feces, soil, or saliva

<sup>2</sup> 0.5 mL IM tetanus and diphtheria toxoids (Td), adsorbed

<sup>3</sup> tetanus immune globulin (TIG), 250 units deep IM

Source: MMWR 2001;50:418-427; MMWR 1991;40:1-52

### Accuracy of Ottawa Ankle Rules to Exclude Fractures of the Ankle and Mid-Foot: Systematic Review

BMJ 2003;326:417

This systematic review and meta-analysis of 27 studies including 15,581 patients evaluated the sensitivity and specificity of the Ottawa Ankle Rules for excluding fractures of the ankle and mid-foot.

**Results:** The pooled likelihood ratio of a negative result (obtaining a false negative) among those with a fracture was determined to be 0.08 for both the ankle and mid-foot.

**Reviewers' Conclusions:** The Ottawa Ankle Rules provide an accurate instrument for excluding fractures of the ankle and mid-foot with a sensitivity of almost 100% and a specificity of 26%. The use of this instrument can reduce the number of unnecessary radiographs.

### Acute Treatment of Contusions

#### RICE

Rest  
Ice  
Compression  
Elevation

### Suture Use and Duration

Suture to	Close with nylon or other nonabsorbable suture	Approx. duration (days)
Face	6-0	5
Not Joint	4-0	7
Joint	3-0	10
Scalp	4-0	7
Mucous Membrane	absorbable (vicryl)	N/A

N.B. Patients on steroid therapy may need sutures for longer periods of time

## Bruises

- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

## Abrasions

- partial to full thickness break in skin
- management
  - clean thoroughly, ± local anesthetic, with brush to prevent foreign body impregnation
  - antiseptic ointment (Polysporin® or Vaseline®) for 7 d for facial and complex abrasions
  - tetanus prophylaxis (Table 11)

## Lacerations

- see also [Plastic Surgery](#), PL8
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury
- physical exam
  - think about underlying anatomy
  - examine tendon function actively against resistance and neurovascular status distally
  - clean and explore under local anesthetic; look for partial tendon injuries
  - x-ray or ultrasound wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radiopaque), or if suspect intra-articular involvement
- management
  - disinfect skin/use sterile techniques
  - irrigate copiously with normal saline
  - analgesia ± anesthesia
  - maximum dose of lidocaine:
    - ♦ 7 mg/kg with epinephrine
    - ♦ 5 mg/kg without epinephrine
- in children, topical anesthetics such as LET (lidocaine, epinephrine and tetracaine) and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
- secure hemostasis
- evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
- ± prophylactic antibiotics (consider for animal/human bites, intraoral lesion or puncture wounds to the foot)
- suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury or retained foreign body
  - take into account patient and wound factors when considering suturing
- advise patient when to have sutures removed
- cellulitis and necrotising fasciitis, see [Plastic Surgery](#), PL14

### Alternatives to Sutures

- Tissue glue
- Steristrips®
- Staples

Where **NOT** to use local anesthetic with epinephrine:

**Ears, Nose, Fingers, Toes and Penis**

### High Risk Factors for Infection

- Puncture wounds
- Crush injuries
- Wounds greater than 12 h old
- Hand or foot wounds, wounds near joints
- Immunocompromised patient
- Patient age greater than 50 yr
- Prosthetic joints or valves (risk of endocarditis)

Early wound irrigation and debridement are the most important factors in decreasing infection.

Since cellulitis can cause edema, remember to elevate the leg to decrease discomfort. Treat with antibiotics, analgesics and close follow-up.

## Trauma in Pregnancy

- priorities: airway, breathing, circulation

### Hemodynamic Considerations (changes that mimic shock)

- near term, inferior vena caval compression in the supine position can decrease cardiac output by 30-40% (see *Maternal Physiology*, [Obstetrics](#), OB3)
  - use left lateral decubitus (LLD) positioning or hip bolster to alleviate compression and increase blood return if BP is low
- BP drops 5-15 mmHg systolic in 2nd trimester, increases to normal by term
- HR increases 15-20 beats per minute by 3rd trimester

### Blood Considerations

- physiologic macrocytic anemia of pregnancy (Hb 100-120 g/L)
- WBC increases to a high of 20,000
- blood volume increase in pregnancy up to 45% (change can mask hypovolemic shock)

### Shock

- pregnant patients may lose 35% of blood volume without typical signs of shock (i.e. tachycardia, hypotension)
- the fetus may be in "shock" due to contraction of the uteroplacental circulation
- fetal HR changes are an early warning of maternal circulatory compromise

### Management Differences

- place bolster under right hip to stop inferior vena cava compression
- fetal monitoring (HR and fetal movements, continuous tocographic monitoring if viable fetus (>20 wk))
- early obstetrical consult
- do not avoid necessary imaging, but shield as much as possible
- consider need for RhoGAM® if mother Rh negative

The best treatment for the fetus is effective treatment of the mother.

- **Primary survey:** focus on mother
- **Secondary survey:** detailed assessment of mother + acquire info about fetus (Hx, fetal monitoring, etc.)

# Approach to Common ER Presentations

## Abdominal Pain

### Rule Out Life-Threatening Causes

- CVS: MI, aortic dissection (tearing pain), ruptured AAA
- GI: perforated viscus, hepatic/splenic injury, ischemic bowel (diffuse pain)
- gynecologic: ectopic pregnancy

### Additional Differential Diagnosis

- GI: appendicitis, diverticulitis, bowel obstruction, hepatitis, cholecystitis, pancreatitis
- urinary: pyelonephritis, ureteral calculi, cystitis
- genital
  - female: tubo-ovarian abscess, ovarian torsion, ovarian cyst, salpingitis, pelvic inflammatory disease (PID), endometriosis
  - male: testicular torsion, epididymitis, prostatitis
- other: diabetic ketoacidosis (DKA), herpes zoster virus (HZV), intra-abdominal abscess, pneumonia, lead poisoning, porphyria, sickle cell crisis, psychiatric

### History

- pain: OPQRST
- broad differential, including GU, gyne, GI, respiratory, and CV systems
- recent/remote abdominal trauma/surgeries

### Physical Examination

- vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and CVS as indicated by history

### Investigations

- do not delay consultation if patient unstable
- CBC, electrolytes, glucose, BUN/creatinine, U/A,  $\pm$  LFTs, lipase (if upper abdominal pain)  $\pm$  others if indicated:  $\beta$ -hCG, ECG, troponins
- AXR: look for calcifications, free air, gas pattern, air fluid levels
- CXR upright: look for pneumoperitoneum (free air under diaphragm)
- U/S: biliary tract, ectopic pregnancy, AAA, free fluid
- CT: trauma, AAA, pancreatitis, nephro/urolithiasis, appendicitis and diverticulitis

### Management

- NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: general surgery, vascular, gynecology, etc.

### Disposition

- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develop

## Acute Pelvic Pain

### Etiology

- gynecological
  - 2nd most common gynecological complaint (after vaginal bleeding)
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis (STI), tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in pregnant patient (degeneration), PID, endometriosis
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), dysmenorrhea and endometriosis
- non-gynecological
  - GI: appendicitis, constipation, bowel obstruction, gastroenteritis, diverticulitis, IBD, IBS
  - GU: cystitis, pyelonephritis, ureteric stone
  - other: porphyria, abdominal angina, aneurysm, hernia, zoster

#### Red Flags

- Unstable vital signs
- Fever
- Signs/symptoms of shock
- Rapid onset severe pain

Be vigilant in those at extremes of ages (very young, elderly) as they often present atypically!

#### Abdominal Assessment in all 4 Quadrants

##### DR. GERM

Distention  
Rigidity  
Guarding  
Evisceration/Ecchymosis  
Rebound tenderness  
Masses

If elevated AST and ALT:  
think hepatocellular injury  
AST > ALT: alcohol – related  
ALT > AST: viral, drug, toxin

If elevated ALP and GGT:  
“think biliary tree” stones

Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have increased suspicion of intrabdominal process in these individuals!

Unstable patients should not be sent for imaging.

All women of childbearing age are assumed to be pregnant. Every pregnancy is potentially ectopic. A  $\beta$ -hCG must be obtained!

#### Gynecological Causes of Pelvic Pain:

- Ovarian cyst
- Dysmenorrhea
- Mittelschmerz
- Endometriosis
- Ovarian torsion
- Uterine fibroids/neoplasm
- Adnexal neoplasm
- PID + cervicitis

## History and Physical Exam

- pain: OPQRST
- associated symptoms: vaginal bleeding, bowel or bladder symptoms, radiation
- vitals
- gynecological exam: assess for cervical motion tenderness = chandelier sign (suggests PID)
- abdominal exam

## Investigations

- bloodwork
  - $\beta$ -hCG for all women of childbearing age
  - CBC and differential, electrolytes, glucose, BUN/Cr, G&S, PTT/INR
- imaging
  - pelvic and abdominal U/S: evaluate adnexa, look for free fluid in the pelvis or masses, evaluate thickness of endometrium, confirm intrauterine pregnancy if  $\beta$ -hCG positive
  - doppler flow studies for ovarian torsion

## Management

- general: analgesia, determine if admission and consults needed
  - gynecology consult if history and physical suggestive of serious cause
  - other consults as indicated
- specific:
  - ovarian cysts
    - ♦ unruptured or ruptured and hemodynamically stable: analgesia and follow-up
    - ♦ ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  - PID: requires broad spectrum antibiotics

## Disposition

- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

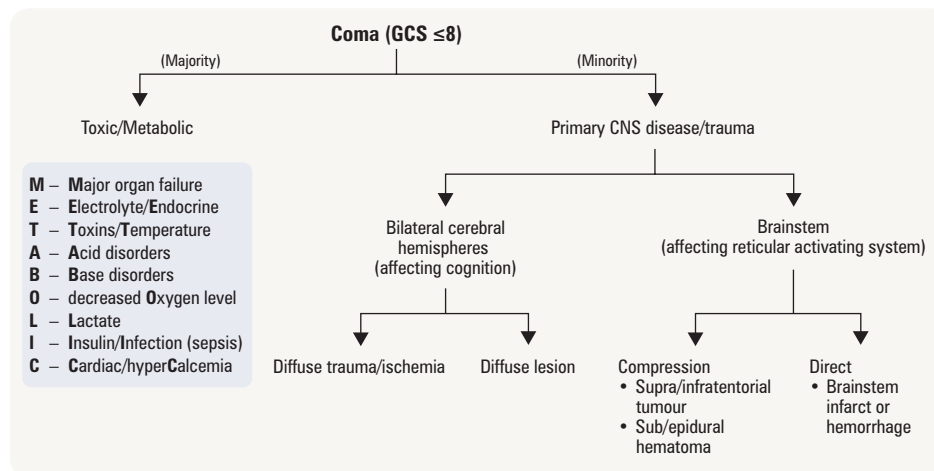

Ultrasound is the preferred imaging modality in the assessment of acute pelvic pain.

## Altered Level of Consciousness (LOC)

### Definitions

- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see [Psychiatry](#), PS19)
  - dementia (see [Psychiatry](#), PS20)
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but aroused
  - coma: a sleep-like state, not arousable to consciousness
  - use the GCS to evaluate LOC (see *Initial Patient Assessment/Management*, ER2)

### Possible Causes of Coma

#### AEIOU TIPS

Acidosis/Alcohol  
 Epilepsy  
 Infection  
 Oxygen (hypoxia)/Opiates  
 Uremia  
 Temperature/Trauma (especially head)  
 Insulin (too little or too much)  
 Psychogenic/Poisoning  
 Stroke

In general, GCS under 8, intubate, but ability to protect airway is primary consideration!

Figure 10. Etiology of coma

## MANAGEMENT OF ALTERED LOC

### History

- obtain collateral from family, friends, police, paramedics, old chart, etc.
- onset and progression
  - abrupt onset suggests CNS hemorrhage/ischemia or cardiac cause
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- preceding events
  - it is essential to determine patient's baseline LOC preceding deterioration
  - antecedent trauma, seizure activity, fever
- past medical history (e.g. similar episode, depression, overdose)

### Physical Examination

- ABCs, vitals including temperature, cardiac, chest, respiratory, abdominal exam, and the "five Ns" (see sidebar)
- complete neuro exam, in particular examination of the eyes (pupil size and reactivity), look for MedicAlert® bracelet

### Investigations

- bloodwork
  - rapid blood sugar, CBC, electrolytes, Cr, BUN, LFTs, glucose, serum osmolality, VBG, PT/PTT/INR, troponins
  - serum EtOH, acetaminophen and salicylate levels
- imaging
  - CXR, CT head
- other tests
  - ECG, U/A, UTox

### Diagnosis

- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - one ampule D50W IV if low blood sugar on finger-prick
  - naloxone 0.4-2 mg IV or IM if opiate overdose suspected
- distinguish between structural and toxic-metabolic coma
  - structural coma
    - ♦ pupils, extraocular movements and motor findings, if present, are usually asymmetric
    - ♦ look for focal or lateralizing abnormalities
  - toxic-metabolic coma
    - ♦ dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - ♦ respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 12)
    - ♦ extraocular movements and motor findings are symmetric or absent
- essential to re-examine frequently – status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")

**Table 12. Toxic-Metabolic Causes of Fixed Pupils**

Dilated	Dilated to Normal	Constricted
Anoxia	Hypothermia	Cholinergic agents (e.g. organophosphates)
Anticholinergic agents (e.g. atropine, TCAs)	Barbiturates	Opiates (e.g. heroin), except meperidine
Methanol (rare)	Antipsychotics	
Cocaine		
Opioid withdrawal		
Amphetamines		
Hallucinogens		

### Disposition

- admission: if ongoing decreased LOC; admit to service based on tentative diagnosis or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

#### Evaluation of Comatose Patient

##### Five Ns

**Noggin** (Signs of Basal skull fracture)  
e.g. raccoon eyes and Battle's sign (bruising of the mastoid process)  
appears about 8 h after trauma

##### Neck

C-spine, neurogenic shock, nuchal rigidity

##### ENT

Otorrhea, rhinorrhea, tongue biting (Stroke), odour on breath (DKA, hepatic encephalopathy, EtOH), hemotympanum

##### Needles

Inspect for track marks

##### Neurological

Concentrate on GCS, respiration, posture, movement, pupils, reflexes

## Chest Pain

### Rule Out Life-Threatening Causes

- CVS: acute coronary syndrome, pericarditis, cardiac tamponade, aortic dissection
- respiratory: pulmonary embolism (PE), pneumothorax (tension or spontaneous)
- GI: esophageal rupture, pneumomediastinum

### Additional Differential Diagnosis

- cardiac: stable angina
- respiratory: pneumonia
- GI: peptic ulcer disease (PUD), pancreatitis, cholecystitis, esophagitis, reflux, esophageal spasm
- MSK: rib fractures, costochondritis, zoster, etc.
- psychogenic/anxiety (diagnosis of exclusion)

### Initial Resuscitation and Management

- O<sub>2</sub>, IV, cardiac monitoring, CXR (portable if unstable), ECG

### History

- must evaluate cardiac risk factors (see *TIMI Score*, [Cardiology](#), C24)
- classic presentations (but presentation seldom classic)
  - aortic dissection: syncope with sudden severe tearing pain, often radiating to back, ± focal pain/neurologic loss in extremities secondary to major vessel ischemia
  - pulmonary embolism: pleuritic chest pain (75%), dyspnea, anxiety, tachycardia, PERC Score
  - pericarditis: anterior precordial pain, pleuritic, relieved by sitting up and leaning forward
  - acute coronary syndrome (ACS): retrosternal squeezing/pressure pain, radiation to arm/neck, dyspnea, nausea/vomiting, syncope
  - esophageal: frequent heartburn, acid reflux, dysphagia, relief with antacids
- ACS more likely to be atypical in females, diabetics, and >80 yr

### Physical Examination

- vitals (BP in both arms, but unreliable indicator of dissection)
- palpate chest wall for tender points; present in 25% of acute MI, but may suggest MSK cause if symptoms fully reproduced and all serious etiologies have been ruled out
- cardiac exam, respiratory exam, peripheral vascular exam

### Investigations

- bloodwork
  - CBC, electrolytes, BUN/Cr
  - CK-MB: if normal, does not rule out MI
  - troponin I: more sensitive (but positive later than CK-MB; can have false positives in renal failure, must follow for 8 h post onset of symptoms)
  - D-dimer: if negative, can rule out PE in low probability patients (see sidebar)
- ECG (see Table 13)
  - always compare with previous
  - PE and acute MI may have normal ECG in up to 50% of cases
  - consider 15-lead ECG if hypotensive or if ECG shows inferior MI or AV node involvement
- CXR
  - always compare with previous
  - PE (see *DVT*, ER33)
    - ♦ 50% completely normal
    - ♦ atelectasis, elevated hemidiaphragm, pleural effusion
  - aortic dissection (see sidebar ER12 for features)
    - ♦ change from previous CXR is the most accurate finding
    - ♦ widened mediastinum (most consistent finding)
    - ♦ CXR is normal in 20% of thoracic dissections
  - pneumothorax (PTX)
    - ♦ may need inspiration and expiration views
    - ♦ if large, may see tracheal shift (away from tension PTX, towards a non-tension PTX)
- V/Q scan or CT, venous leg Doppler, required to rule out PE in patients with intermediate or high probability (see sidebar for Wells' Score, E34)

### Disposition

- admission and monitoring: patients at risk of developing dysrhythmias
- consult: cardiology for patients with ACS; cardiothoracic surgery for patients with valvular lesions, esophageal rupture, or aortic dissection
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; instruct the patient to return if they develop SOB or increased chest pain

#### Life Threatening Causes of Chest Pain

##### PET MAP

Pulmonary embolism  
Esophageal rupture  
Tamponade  
MI/angina  
Aortic dissection  
Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of blood pressure.

#### Signs and Symptoms of MI

##### PULSE

Persistent chest pain  
Upset stomach  
Lightheadedness  
Shortness of breath  
Excessive sweating

#### Signs of PE on CXR

**Westermark's sign:** abrupt tapering of a vessel on chest film.

**Hampton's hump:** a wedge-shaped infiltrate that abuts the pleura.

**Table 13. Common Life Threatening ECG Changes**

Pathology	ECG Findings
<b>Dysrhythmia</b>	
a) Torsade de pointes	Ventricular complexes in upward-pointing and downward-pointing continuum (250-350 bpm)
b) Ventricular tachycardia	6 or more consecutive premature ventricular beats (150-250 bpm)
c) Ventricular flutter	Smooth sine wave pattern of similar amplitude (250-350 bpm)
d) Ventricular fibrillation	Erratic ECG tracing, no identifiable waves
<b>Conduction</b>	
a) 2nd degree heart block (Mobitz Type II)	PR interval stable, some QRS's dropped
b) 3rd degree heart block	Total AV dissociation, but stable P-P and R-R intervals
c) Left bundle branch block	Prolonged QRS complex (> 0.12 s) RSR' in V5 or V6 Monophasic I and V6 May see ST elevation Difficult to interpret, new LBBB is considered STEMI equivalent
<b>Ischemia</b>	
a) STEMI	ST elevation in leads associated with injured area of heart and reciprocal lead changes (depression)
<b>Metabolic</b>	
a) Hyperkalemia	Tall T waves P wave flattening QRS complex widening and flattening
b) Hypokalemia	U waves appear Flattened T waves
<b>Digitalis Toxicity</b>	
	Gradual downward curve of ST At risk for AV blocks and ventricular irritability
<b>Syndromes</b>	
a) Brugada	RBBB with ST elevation in V1, V2 and V3 Susceptible to deadly dysrhythmias, including ventricular fibrillation
b) Wellens	Marked T wave inversion in V2 and V3 Left anterior descending coronary stenosis
c) Long QT syndrome	QT interval longer than 1/2 of cardiac cycle Predisposed to ventricular dysrhythmias

**ACUTE MYOCARDIAL INFARCTION**

- see [Cardiology](#), C24

**Management**

- immediate stabilization
  - oxygen 4 L/min
  - IV access
  - cardiac monitors
  - STAT ECG
  - cardiac enzymes (CK, troponins)
- ASA 162-325 mg chewed
- nitroglycerin 0.3 mg SL q5min x 3 (IV for CHF, HTN, unresolved pain)
- morphine 2-5 mg IV q5-30min if unresponsive to nitroglycerin
- low molecular weight heparin 1 mg/kg SC bid (30 mg IV STAT post TNK infusion)
- thrombolytics (within 30 min) or primary percutaneous coronary intervention (PCI) (within 90 min)
  - agents include rt-PA, streptokinase, and TNK
  - evaluate indications and contraindications prior to use
- other: antidysrhythmics, cardioversion, defibrillation, transthoracic pacing, angioplasty
- cardiology consult

Important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations).

**Immediate Treatment of Acute MI****BEMOAN**

**β**-Blockade

Enoxaparin

Morphine

Oxygen

ASA

Nitroglycerin

**Addition of Clopidogrel to Aspirin® and Fibrinolytic Therapy for Myocardial Infarction with ST-Segment Elevation**  
*NEJM* 2005;352:1179-1191

**Purpose:** To assess the benefit of adding clopidogrel to Aspirin® and fibrinolytic therapy in ST-elevation MI.

**Study Characteristics:** Double-blind, RCT, following intention-to-treat analysis, with 3491 patients and clinical follow-up at 30 d.

**Participants:** Individuals presenting within 12 h of onset of ST-elevation MI (mean age 57, 80.3% male, 50.3% smokers, 9.1% previous MI). Those presenting after 12 h, age >75, or with previous CABG were excluded.

**Intervention:** Clopidogrel (300 mg loading dose followed by 75 mg OD until day of angiogram) or placebo, in addition to Aspirin®, a fibrinolytic agent, and heparin when appropriate.

**Primary Outcome:** Composite of occluded infarct-related artery on angiography (thrombosis in MI flow grade 0 or 1), or death or recurrent MI prior to angiography.

**Results:** Rates of primary end point were 21.7% in the placebo group and 15.0% in the clopidogrel group (95% CI, 24-47%). Among the individual components of the primary end point, clopidogrel had a significant effect on the rate of an occluded infarct-related artery and the rate of recurrent MI, but no effect on the rate of death from any cause. At 30 d clinical follow-up, there was no difference in rate of death from cardiovascular causes, a significant reduction in the odds of recurrent MI, and a non-significant reduction in recurrent ischemia with need for urgent revascularization. The rates of major bleeding and intracranial hemorrhage were similar between the two groups.

**Conclusion:** Addition of clopidogrel improves the patency rate of infarct-related arteries and reduces ischemic complications, both of which are associated with improved long-term survival after MI. The trial was not powered to detect a survival benefit and none was seen.

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack.

**Complications of Nasal Packing**

- Hypoxemia
- Toxic-shock syndrome
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

**Epistaxis**

- see [Otolaryngology](#), OT26
- 90% of nosebleeds stem from the anterior nasal septum (at Kiesselbach's plexus located in Little's area)
- can be life-threatening

**Etiology**

- most commonly caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin®), or systemic disease (coagulopathies, hypertension, etc.)

**Investigations**

- bloodwork: CBC, PT/PTT (as indicated)
- imaging: x-ray, CT as needed

## Treatment

- aim is to localize bleeding and achieve hemostasis
- first-aid: ABCs, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV normal saline, cross match 2 units packed RBC if significant
- determine site of bleeding: use topical anaesthetic/vasoconstrictor to facilitate; use nasal speculum and good lighting
- attempt to control the bleeding
  - first line: Otrivin® or cocaine
  - second line: cauterize with silver nitrate (one side of septum only because if both are cauterized this can lead to septal perforation!)
  - if these fail, or if bleeding is posterior → nasal packing (must monitor for complications)
  - if packing fails, consult ENT

## Disposition

- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, topical ointments, avoiding irritants, managing hypertension)
- admission: severe cases of refractory bleeding

# Headache

- see also [Neurology](#), N38

## Etiology

- the common
  - common migraine (no aura)/classic migraine (involves aura)
    - ♦ gradual onset, unilateral/bilateral, throbbing
    - ♦ nausea/vomiting, photo/phonophobia
    - ♦ treatment: analgesics, neuroleptics, vasoactive meds
  - tension/muscular headache
    - ♦ never during sleep, gradual over 24 h
    - ♦ posterior/occipital
    - ♦ increased with stressors
    - ♦ treatment: modify stressor, local measures, NSAIDs, tricyclic antidepressants
- the deadly
  - subarachnoid hemorrhage (SAH) (see [Neurosurgery](#), NS18)
    - ♦ sudden onset, increased with exertion
    - ♦ reaches maximum intensity within minutes, nausea and vomiting, meningeal signs
    - ♦ diagnosis: CT, LP (5-10% of patients with SAH have negative initial CT)
      - sensitivity of CT decreases with time and is much less sensitive by 48-72 h
      - if CT done within 6 h of headache onset, no need for LP
    - ♦ management: urgent neurosurgery consult
  - increased ICP
    - ♦ worse in morning, when supine or bending down, with cough or Valsalva
    - ♦ physical exam: neurological deficits, cranial nerve palsies, papilledema
    - ♦ diagnosis: CT scan
    - ♦ management: consult neurosurgery
  - meningitis (see [Infectious Diseases](#), ID19)
    - ♦ flu-like presentation initially (fever, nausea/vomiting, malaise), meningeal signs, purpuric rash
    - ♦ altered LOC and confusion
    - ♦ perform CT to rule out increased ICP then do LP for diagnosis
    - ♦ treatment: early empiric antibiotics (depending on age group), steroid therapy
  - temporal arteritis (causes great morbidity in terms of blindness) (see [Ophthalmology](#), OP38)
    - ♦ unilateral scalp tenderness, jaw claudication, visual disturbances
    - ♦ labs: elevated ESR, CRP
    - ♦ temporal artery biopsy is gold standard for diagnosis
    - ♦ associated with polymyalgia rheumatica
    - ♦ treatment: high-dose steroids immediately if suspected

## Disposition

- admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: most patients can be discharged with appropriate analgesia and follow up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

Note: up to 5% of patients with subarachnoid hemorrhage have a normal CT scan; if suspect SAH with a negative CT, perform a LP.

### DDx Subarachnoid Hemorrhage

#### BATS

Berry aneurysm  
Arteriovenous malformation/Adult polycystic kidney disease  
Trauma  
Stroke

### Meningitis

Do not delay IV antibiotics for LP.

## Joint Pain

- see [Rheumatology](#), RH3

### Rule Out Life-Threatening Causes

- septic joint (see [Orthopedics](#), OR10)

### Differential Diagnosis

- articular pain
  - monoarticular
    - ♦ infectious: bacterial, viral, fungal
    - ♦ hemarthrosis: trauma/fracture, anticoagulants, bleeding diatheses
    - ♦ crystal induced: gout, calcium pyrophosphate deposition, hydroxyapatite
    - ♦ inflammatory: seropositive, seronegative
    - ♦ neoplasm
    - ♦ degenerative: osteoarthritis
  - polyarticular
    - ♦ infectious: Lyme disease, bacterial endocarditis, septicemia, gonococcus, viral
    - ♦ post-infectious: rheumatic fever, reactive arthritis, enteric infections
    - ♦ inflammatory: seropositive, seronegative
    - ♦ degenerative: osteoarthritis
- non-articular
  - musculoskeletal
    - ♦ localized: tendonitis, bursitis, capsulitis, muscle sprain
    - ♦ generalized: fibromyalgia, polymyalgia rheumatica
- other
  - neurologic: spinal stenosis/spondylolithesis, degenerative disc disease, cauda equina syndrome, neoplasm, thoracic outlet syndrome, Charcot joint
  - vascular: intermittent claudication

### History and Physical Examination

- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: prolonged morning stiffness, stiffness and pain ease through the day, midday fatigue, soft tissue swelling
- non-inflammatory symptoms: stiffness short lived after inactivity, short duration stiffness in the morning, pain increases with activity
- assess ROM, presence of joint effusion, warmth
- watch for: localized joint pain, erythema, warmth, swelling with pain on active ROM, inability to bear weight, fever as these may indicate presence of septic joint

### Investigations

- bloodwork
  - CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate
- imaging
  - joint x-ray ± contralateral joint for comparison
- other investigations
  - joint aspirate → send for: WBC, protein, glucose, Gram stain, crystals

### Management

- septic joint: IV antibiotics ± joint decompression and drainage
  - antibiotics can be started empirically if septic arthritis cannot be ruled out
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
  - do not use allopurinol, as it may worsen acute attack
- acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritis: NSAIDs, acetaminophen
- soft tissue pain: allow healing with enforced rest ± immobilization
  - nonpharmacologic treatment: local heat or cold, electrical stimulation, massage
  - pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

#### Causes of Joint Pain

##### SOFTER TISSUE

Sepsis  
Osteoarthritis  
Fractures  
Tendon/muscle  
Epiphyseal  
Referred  
  
Tumour  
Ischemia  
Seropositive arthritides  
Seronegative arthritides  
Urate  
Extra-articular rheumatism  
(e.g. polymyalgia)

#### Hospitalization is required for joint pain in the presence of:

- Significant, concomitant internal organ involvement
- Signs of bacteremia, including vesiculopustular skin lesions, Roth spots, shaking chills, or splinter hemorrhages
- Systemic vasculitis
- Severe pain
- Severe constitutional symptoms
- Purulent synovial fluid in one or more joints
- Immunosuppression

## Otalgia

### Differential Diagnosis (see also [Otolaryngology](#), OT6)

- local
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess
  - others: trauma, neoplasm, foreign body, cerumen impactions, granulomatosis with polyangiitis

**History**

- OPQRST
- associated symptoms: aural fullness (feeling of pressure), otorrhea, hearing loss, tinnitus, vertigo, pruritis, fever
- risk factors: Q-tip use, hearing aids, headphones

**Physical Exam**

- observe for otorrhea, palpation of outer ear/mastoid, otoscope to see bulging erythematous TM, perforation

**Investigations**

- consider audiogram if hearing loss
- CT head if suspicion of mastoiditis, malignant OM

**Management**

- debridement and antibiotics for cerumen and infection

## Seizures

- see [Neurology](#), N14

**Definition**

- paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons

**Categories**

- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hypo/hyperglycemia, hypo/hyponatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, pseudoseizures, migraines, movement disorder, narcolepsy/cataplexy, myoclonus

**History**

- from patient and bystander: flaccid and unconscious, often with deep rapid breathing
- preceding aura, rapid onset, loss of bladder/bowel control, tongue-biting (sides of the tongue)
- timing: length of seizure

**Physical Examination**

- injuries to head and spine and bony prominences (e.g. elbows), tongue laceration, aspiration, urinary incontinence

**Investigations**

- known seizure disorder: anticonvulsant levels
- Accu-Chek®
- first time seizure: CBC, serum glucose, electrolytes, BUN/Cr,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ; consider prolactin,  $\beta$ -hCG, toxicology screen
- initial imaging: CT; x-ray if suspected extremity injuries. Definitive imaging: MRI, EEG

**Minimum Workup in an Adult with 1st Time Seizure**

CBC and differential  
Electrolytes including  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{PO}_4^{3-}$   
Head CT

**Table 14. Management of Status Epilepticus**

Time (min)	Steps
0-5	Give oxygen; ensure adequate ventilation Monitor: vital signs, electrocardiography, oximetry Establish IV access; obtain blood samples for glucose level, CBC, electrolytes, toxins, and anticonvulsant levels
6-9	Give 50 mL 50% glucose (preceded by thiamine 100 mg IM in adults)
10-20	IV lorazepam 0.1 mg/kg at 2 mg/min or IV diazepam 0.2 mg/kg at 5 mg/min Diazepam can be repeated if seizures do not stop after 5 min; if diazepam is used to stop the status, then phenytoin should be administered promptly to prevent the recurrence of status
21-60	If status persists, administer 15-20 mg/kg of phenytoin intravenously no faster than 50 mg/min in adults and 1 mg/kg/min in children
>60	If status does not stop after 20 mg/kg of phenytoin, give additional doses of 5 mg/kg to a maximal dose of 30 mg/kg If status persists, then give 20 mg/kg of phenobarbital IV at 100 mg/min. When phenobarbital is given after a benzodiazepine, ventilatory assistance is usually required If status persists, then give general anaesthesia (e.g. pentobarbital). Vasopressors or fluid volume are usually necessary. Electroencephalogram should be monitored. Neuromuscular blockade may be needed

If administering phenytoin, patient must be on a cardiac monitor as dysrhythmias and/or hypotension may occur.

**Disposition**

- the decision to admit or discharge should be based on the underlying disease process identified
  - if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
- first-time seizure patients being discharged should be referred to a neurologist for follow-up
- admitted patients should generally have a neurology consult
- patient should not drive until medically cleared (local regulations vary)
  - complete notification form to appropriate authority re: ability to drive
- warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)

## Shortness of Breath

- see [Respirology](#), R3 and [Cardiology](#), C5

**Etiology**

- categorized into one of two groups: respiratory or cardiovascular
- respiratory system dyspnea: discomfort related to disorders of the central controller (brain), the ventilatory pump (ventilatory muscles, peripheral nerves), and the gas exchanger (alveoli and pulmonary capillaries)
- cardiovascular system dyspnea: cardiac diseases (acute ischemia, heart failure, systolic dysfunction, valvular disorders, pericardial diseases, arrhythmias), anemia, and deconditioning

**History/Physical**

- acute SOB is often due to a relatively limited number of conditions. Associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischemia
  - fever, cough and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
- dyspnea may be the sole complaint and the physical examination may reveal few abnormalities (e.g. pulmonary embolism, pneumothorax)
- chest tightness may be indicative of bronchospasm
- a sensation of rapid, shallow breathing may correspond to interstitial disease
- a sense of heavy breathing is typical of deconditioning
- vitals including pulse oximetry
  - wheeze (airway) vs. crackles (parenchymal), JVP, and murmurs

**Investigations**

- bloodwork
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider VBG
  - serial cardiac enzymes and ECG if considering cardiac source
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection or interstitial fluid)
  - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (PE)

**Disposition**

- the history and physical examination lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
  - consider intubation in CO<sub>2</sub> retainers (e.g. COPD)
- if the decision to discharge is chosen, provide appropriate discharge instructions to return in case of returning/worsening SOB

## Syncope

**Definition**

- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system hypoperfusion

**Etiology**

- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, tamponade, tension pneumothorax, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)

**Causes of Acute Dyspnea**

**Cardiovascular:** acute MI, CHF, cardiac tamponade, arrhythmias.

**Respiratory:** bronchospasm, pulmonary embolism, pneumothorax, infection (bronchitis, pneumonia), upper airway obstruction (aspiration, anaphylaxis).

**5 Types of Syncope**

- Vasomotor
- Cardiac
- CNS
- Metabolic
- Psychogenic

## History

- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features 1. Prodrome 2. Situation
- distinguish between syncope and seizure (see [Neurology](#), N15)
  - some patients may have myoclonic jerks with syncope – NOT a seizure
  - signs and symptoms during presyncope, syncope and postsyncope
  - past medical history, drugs
  - think anatomically in differential: pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if:
  - there is sudden loss of consciousness with no warning or prodrome OR
  - syncope is accompanied by chest pain

## Physical Examination

- postural BP and HR
- cardiovascular, respiratory and neuro exam
- physical findings in the elderly patient who falls (**I HATE FALLING**):
  - Inflammation of joints (or joint deformity)
  - Hypotension (orthostatic blood pressure changes)
  - Auditory and visual abnormalities
  - Tremor (Parkinson's disease or other causes of tremor)
  - Equilibrium (balance) problem
  - Foot problems
  - Arrhythmia (dysrhythmia), heart block or valvular disease
  - Leg-length discrepancy
  - Lack of conditioning (generalized weakness)
  - Illness
  - Nutrition (poor; weight loss)
  - Gait disturbance

## Investigations

- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval), bedside glucose
- bloodwork: CBC, electrolytes, BUN, creatinine, ABGs, troponin,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\beta\text{-hCG}$
- consider toxicology screen

## Management

- ABCs, IV,  $\text{O}_2$ , monitor
- examine for signs of trauma caused by syncopal episode
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

## Disposition

- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
  - educate re: avoiding orthostatic or situational syncope
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

### Causes of Syncope by System

#### HEAD, HEART, VeSSELS

Hypoxia/Hypoglycemia

Epilepsy

Anxiety

Dysfunctional brainstem

Heart attack

Embolism (PE)

Aortic obstruction

Rhythm disturbance

Tachycardia

Vasovagal

Situational

Subclavian steal

ENT (glossopharyngeal neuralgia)

Low systemic vascular resistance

Sensitive carotid sinus

**San Francisco Syncope Rule: High risk of adverse outcomes in syncope patients if:**

#### CHES

CHF: Hx of CHF

Hct: Low

ECG: Abnormal

SOB: Hx of dyspnea

SBP: SBP <90 at triage

**Which patients with syncope should be admitted?**

Those at risk of complications:

- Older than 60-70 yr
- Significant cardiac risk factors
- Recurrent syncope
- Serious underlying illness

## Sexual Assault

- legally required to report sexual assault if victim is <16 yr of age to Children's Aid Society (CAS)

## Epidemiology

- 1 in 4 women and 1 in 10 men will be sexually assaulted in their lifetime
- it is estimated that only 7% of rapes are reported

## General Approach

- ABCs, treat acute, serious injuries
- ensure patient is not left alone and provide ongoing emotional support
- set aside adequate time for exam (usually 1.5 h)
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests (legally required if <16 yr old)

Legally required to report sexual assault if victim is <16 yr of age to Children's Aid Society (CAS).

**History**

- ensure privacy for the patient – others should be asked to leave
- questions to ask: who? when? where did penetration occur? what happened? any weapons or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
  - gravity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

**Physical Examination**

- evidence collection is always secondary to treatment of serious injuries
- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)
- pelvic exam and specimen collection
  - ideally before urination or defecation
  - examine for seminal stains, hymen, signs of trauma
  - collect moistened swabs of dried seminal stains
  - pubic hair combings and cuttings
  - speculum exam
    - ♦ lubricate with water only
    - ♦ vaginal lacerations, foreign bodies
    - ♦ Pap smear
    - ♦ oral/cervical/rectal culture for gonorrhea and chlamydia
    - ♦ posterior fornix secretions if present or aspiration of saline irrigation
    - ♦ immediate wet smear for motile sperm
    - ♦ air-dried slides for immotile sperm, acid phosphatase, ABO group
- others
  - fingernail scrapings
  - saliva sample from victim

**Investigations**

- VDRL: repeat in 3 mo if negative
- serum  $\beta$ -hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

**Management**

- involve local/regional sexual assault team
- medical
  - suture lacerations
  - tetanus prophylaxis
  - gynecology consult for foreign body, complex lacerations
  - assumed positive for gonorrhea and chlamydia
    - ♦ management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 7 d) and cefixime 800 mg PO x 1 dose
  - may start prophylaxis for hepatitis B and HIV
  - pre and post counselling for HIV testing
  - pregnancy prophylaxis offered
    - ♦ levonorgestrel 0.75 mg PO STAT, repeat within 12 h (Plan B\*)
- psychological
  - high incidence of psychological sequelae
  - have victim change and shower after exam completed

**Disposition**

- discharge if injuries/social situation permit
- follow-up with MD in rape crisis centre within 24 h
- best if patient does not leave ED alone

**DOMESTIC VIOLENCE**

- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
  - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns or other injuries; often do not match up with history provided)
  - somatic symptoms (chronic and vague complaints)
  - psychosocial symptoms
  - clinician impression (your 'gut feeling', e.g. overbearing partner that won't leave patient's side)

**Risk of Sexually Transmitted Disease After Sexual Assault**

- Gonorrhea: 6-18%
- Chlamydia: 4-17%
- Syphilis: 0.5-3%
- HIV: <1%

How do you get a patient who is accompanied by her partner alone without arousing suspicion? Order an x-ray.

- if disclosed, be supportive and assess danger
- if necessary, order an x-ray to get patient alone to question
- patient must consent to follow-up investigation/reporting (unless for children)

### Management

- treat injuries
- ask about sexual assault and children at home (encourage notification of police)
- document findings
- safety plan
- follow-up: family doctor/social worker

## Medical Emergencies

### Anaphylaxis and Allergic Reactions

#### Etiology

- anaphylaxis is an exaggerated immune mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation. Regardless of the etiology, the presentation and the management of anaphylactic reactions are the same
  - allergic (re-exposure to allergen)
  - non-allergic (e.g. exercise induced)

#### Presentation

- classic presentation of anaphylaxis includes:
  1. rapid onset and progression of symptoms
  2. life threatening compromise of one or more of airway (breathing/swallowing difficulty, stridor, voice change), breathing (shortness of breath, hypoxemia, wheezing, respiratory arrest), and circulation (tachycardia, hypotension, confusion, decreased urine output, chest pain)
  3. involvement of skin (erythema, urticaria, warmth) and/or mucosa (angioedema, obstruction, GI symptoms). Not always present
- most common allergens causing anaphylaxis are food (nuts, seafood), stings, and drugs (antibiotics, anesthetics)
- the presentation of anaphylaxis is diverse and there is no one specific symptom or sign for it
  - combinations of symptoms and signs will make anaphylaxis more likely
- life threatening differentials for anaphylaxis include asthma and septic shock

#### Management

1. immediate initial management (call for help and perform concurrently)
  - give 0.5 mL of 1:1000 epinephrine IM to lateral thigh. (0.01 mL/kg up to 0.4 mL for children)
  - remove causative agent if possible
  - if severely compromised ABC or LOC, consult ICU immediately
  - otherwise, provide 100% Oxygen through mask, give bolus 1000 mL (20 mL/kg for children) crystalloid IV then reassess. If IV access difficult give fluid through intraosseous route
  - have continuous pulse oximetry and telemetry monitoring
  - frequently monitor blood pressure
2. secondary treatment
  - diphenhydramine (Benadryl®) 50 mg IM or IV q4-6h
  - methylprednisolone 50-100 mg IV (dose depending on severity)
  - salbutamol (Ventolin®) via nebulizer if bronchospasm

#### Disposition

- monitor for 4-6 h in ED (minimum) and arrange follow up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 48 h later, patient may need to be supervised (oral steroids on discharge may prevent this)
- educate patient on avoidance of allergens
- 3-day course of:
  - H1 antagonist (cetirizine 10 mg PO OD or Benadryl® 50 mg PO q4-6h)
  - H2 antagonist (ranitidine 150 mg PO OD)
  - corticosteroid (prednisone 50 mg PO OD) generally given for 5 d

#### Most Common Triggers for Anaphylaxis

- Foods (nuts, shellfish, etc.)
- Stings
- Drugs (penicillin, NSAIDs, ACEI)
- Radiographic contrast media
- Blood products
- Latex

Anaphylaxis should be suspected if airway, breathing or especially circulation compromise is present after exposure to a known allergen.

#### Treatment

- Airway control
- Epinephrine
- Establish IV and give fluids
- Steroids
- Anti-histamines

## Asthma

- see [Respirology](#), R6
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

Beware of the silent asthmatic! This is a medical emergency and may require emergency intubation.

## Investigations

- O<sub>2</sub> saturation
- peak flow meter
- $\pm$  ABG if in severe respiratory distress
- CXR if diagnosis in doubt or concerns of pneumonia, pneumothorax, etc.

**Table 15. Asthma Assessment and Management**

Classifications	History and Physical Examination	Management
<b>Respiratory Arrest Imminent</b>	<ul style="list-style-type: none"> <li>• Exhausted, confused, diaphoretic, cyanotic</li> <li>• Silent chest, ineffective respiratory effort</li> <li>• Decreased HR, RR &gt; 30, pCO<sub>2</sub> &gt; 45 mmHg</li> <li>• O<sub>2</sub> sat &lt; 90% despite supplemental O<sub>2</sub></li> </ul>	<ul style="list-style-type: none"> <li>• 100% O<sub>2</sub>, cardiac monitor, IV access</li> <li>• Intubate (consider induction with ketamine)</li> <li>• <math>\beta</math>-agonist: nebulizer 5 mg continually</li> <li>• Anticholinergics: nebulizer 0.5 mg x 3</li> <li>• IV steroids: methylprednisolone 125 mg</li> </ul>
<b>Severe Asthma</b>	<ul style="list-style-type: none"> <li>• Agitated, diaphoretic, laboured respirations</li> <li>• Speaking in words</li> <li>• No relief from <math>\beta</math>-agonist</li> <li>• O<sub>2</sub> sat &lt; 90%, FEV<sub>1</sub> &lt; 50%</li> </ul>	<ul style="list-style-type: none"> <li>• Anticipate need for intubation</li> <li>• Similar to above management</li> <li>• Magnesium sulphate 2 g IV</li> <li>• O<sub>2</sub> to achieve O<sub>2</sub>-sat &gt; 92%</li> </ul>
<b>Moderate Asthma</b>	<ul style="list-style-type: none"> <li>• SOB at rest, cough, congestion, chest tightness</li> <li>• Speaking in phrases</li> <li>• Inadequate relief from <math>\beta</math>-agonist</li> <li>• FEV<sub>1</sub> 50-80%</li> </ul>	<ul style="list-style-type: none"> <li>• O<sub>2</sub> to achieve O<sub>2</sub>-sat &gt; 92%</li> <li>• <math>\beta</math>-agonist: MDI or nebs q5min</li> <li>• Steroids: prednisone 40-60 mg PO</li> <li>• Anticholinergics (Atrovent) MDI or nebs x3</li> </ul>
<b>Mild Asthma</b>	<ul style="list-style-type: none"> <li>• Exertional SOB/cough with some nocturnal symptoms</li> <li>• Difficulty finishing sentences</li> <li>• FEV<sub>1</sub> &gt; 80%</li> </ul>	<ul style="list-style-type: none"> <li>• <math>\beta</math>-agonist</li> <li>• Monitor FEV<sub>1</sub></li> <li>• Consider steroids (MDI or PO)</li> </ul>

## Disposition

- $\beta$ -agonist MDI regular use (2-4 puffs q2-4h) until symptoms controlled then prn
- prednisone 30-60 mg/d for 7-14 d with no taper
- inhaled corticosteroids
- follow-up with primary care physician

### 5 Essential Elements on History

- Cause of exacerbation
- Previous ER/ICU visits
- Previous intubations
- Timing of recent steroid use
- Frequency of asthma medication use

### Treatment of Asthma

#### ASTHMA

Adrenergics ( $\beta$ -agonists)

Steroids

Hydration

Mask (O<sub>2</sub>)

Antibiotics (if concurrent bacterial pneumonia)

## Cardiac Dysrhythmias

- see [Cardiology](#), C12

### Bradycardias and AV Conduction Blocks

- AV conduction blocks
  - 1<sup>st</sup> degree: prolonged PR interval (>200 msec), no treatment required
  - 2<sup>nd</sup> degree
    - ♦ Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - ♦ Mobitz II: PR interval constant with dropped QRS complex, can progress to 3<sup>rd</sup> degree AV block
  - 3<sup>rd</sup> degree: P wave unrelated to QRS complex, PP and RR intervals constant
    - ♦ atropine and transcutaneous pacemaker (TCP) (atropine with caution)
    - ♦ if TCP fails consider dopamine, epinephrine IV
  - long term treatment for Mobitz II and 3<sup>rd</sup> degree block – internal pacemaker
- sinus bradycardia (rate < 60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g.  $\beta$ -blockers, CCBs)
  - treat if symptomatic (hypotension, chest pain)
    - ♦ acute: atropine  $\pm$  transcutaneous pacing
    - ♦ sick sinus: transcutaneous pacing
    - ♦ drug induced: discontinue/reduce offending drug

### Supraventricular Tachydysrhythmias (narrow QRS)

- sinus tachycardia (rate > 100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider  $\beta$ -blocker if symptomatic
- regular rhythm
  - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
  - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
    - ♦ monitor for recurrence
    - ♦ treat recurrence with adenosine or longer acting medications

If the patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion.

### Clinical Features of Instability

- Hypotension (sBP < 90)
- CHF or pulmonary edema
- Chest pain
- Altered LOC (may indicate shock)

- rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
  - ♦ rate control (diltiazem,  $\beta$ -blockers) and consult cardiology
- irregular rhythm
  - probable atrial fibrillation, atrial flutter or multifocal atrial tachycardia
  - rate control (diltiazem,  $\beta$ -blockers)

### Atrial Fibrillation (AFib)

- most common sustained dysrhythmia; no organized P waves (atrial rate  $>300/\text{min}$ ), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
  - if unstable: immediate synchronized cardioversion
  - if onset of AFib is  $>48$  h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion or do transesophageal echo to rule out clot
  - if onset  $<48$  h: may cardiovert
    - ♦ electrical cardioversion: synchronized direct current (DC) cardioversion
    - ♦ chemical cardioversion: procainamide, flecainide, propafenone
- long term management: rate or rhythm control, consider anticoagulation (CHADS2 score, see sidebar)

If patient has Wolff-Parkinson-White and is in AFib use amiodarone or procainamide. Avoid AV nodal blocking agents (adenosine, digoxin, diltiazem, verapamil,  $\beta$ -blockers) as this can increase conduction through bypass tract leading to cardiac arrest

Use the CHADS2 score from Table 3, [Cardiology, C17](#)

### Ventricular Tachydysrhythmias (wide QRS)

- ventricular tachycardia (VT) (rate usually 140-200 bpm)
  - definition: 3 or more consecutive ventricular beats at  $>100$  bpm
  - etiology: CAD with MI is most common cause
  - treatment: sustained VT ( $>30$  s) is an emergency
    - ♦ hemodynamic compromise: synchronized DC cardioversion
    - ♦ no hemodynamic compromise: synchronized DC cardioversion, lidocaine, amiodarone, procainamide
- ventricular fibrillation: call a code blue, follow ACLS for pulseless arrest
- torsades de pointes
  - looks like VT but QRS 'rotates around baseline' with changing axis and amplitude (twisted ribbon)
  - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  - treatment:
    - ♦ IV  $\text{Mg}^{2+}$ , temporary overdrive pacing, isoproterenol
    - ♦ correct cause of prolonged QT

## Chronic Obstructive Pulmonary Disease (COPD)

- see [Respirology, R8](#)
- progressive development of irreversible airway obstruction, typically caused by smoking
- acute exacerbation: episode of increased dyspnea, coughing, increase in sputum volume or purulence

### History and Physical Examination

- worsening dyspnea or tachypnea
- acute change in frequency, quantity and colour of sputum production
- triggers: pneumonia, urinary tract infection, PE, CHF, MI, drugs

### Investigations

- CBC, electrolytes, ABG, CXR, ECG, PFTs

### Management

- keep  $\text{O}_2$  sat 88-92% (beware of  $\text{CO}_2$  retainers, but do not withhold  $\text{O}_2$  if hypoxic)
- apply BiPAP if severe distress, arterial pH  $<7.35$  or hypercapnic
- ipratropium is bronchodilator of choice, add salbutamol
- steroids: prednisone 40 mg PO (tapered over 3 wk)
- antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (if signs of infection)
- ICU admission, if life-threatening, for ventilation (chance of ventilation dependency)
- lower threshold to admit if co-morbid illness

### Disposition

- can use up to 4-6 puffs qid of ipratropium and salbutamol for exacerbations
- continue antibiotics if started and give tapering steroids

#### Need to Rule Out with COPD Exacerbation

- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE

## Congestive Heart Failure

- also see [Cardiology](#), C30

### Etiology

- decreased myocardial contractility: ischemia, infarction, cardiomyopathy, myocarditis
- pressure overload states: hypertension, valve abnormalities, congenital heart disease
- restricted cardiac output: myocardial infiltrative disease, cardiac tamponade
- volume overload

### Causes of Exacerbation or Precipitants

- please refer to the FAILURE mnemonic on the side bar

### Presentation

- left-sided heart failure
  - dyspnea, decreased exercise tolerance, paroxysmal nocturnal dyspnea, orthopnea, nocturia, fatigue, possibly altered mental status, syncope, angina, systemic hypotension
  - hypoxia, decreased air entry to lungs, rales, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation, hepatic enlargement, ascites
- patients often present with a combination of right-sided and left-sided symptoms

### Investigations

- labs: CBC, electrolytes, AST, ALT, bilirubin, creatinine, BUN, cardiac enzymes, BNP (brain natriuretic peptide)
- chest x-ray (see sidebar)
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion)
  - in CHF: LVH, atrial enlargement, conduction abnormalities
- ABG: if severe or refractory to treatment
  - hypoxemia, hypercapnia and acidosis are signs of severe CHF
- echocardiogram: not usually used in emergency evaluation, previous results may aid in diagnosis
- may be precipitated by dysrhythmia (e.g. sudden onset AFib) – correct if new
- rule out serious differentials such as PE, pneumothorax, pneumonia/empyema, COPD exacerbation

### Management (acute)

- ABC, may require intubation if severe hypoxia
- sit upright, cardiac monitoring and continuous pulse oximetry
- saline lock IV, Foley catheter (to follow effectiveness of diuresis)
- 100% O<sub>2</sub> by mask
  - if poor response may require BiPAP or intubation
- drugs
  - nitroglycerin 0.3 mg SL q5min prn ± topical nitro patch (0.2-0.8 mg/h)
    - ♦ if not responding or ischemia: 10-200 µg/min IV, titrate
  - diuretic if volume overloaded (e.g. furosemide 40-80 mg IV), use caution if cause is valvulopathy
  - morphine 1-2 mg IV prn
    - ♦ if hypotensive: dobutamine (2.5 µg/kg/min IV) or dopamine (5-10 µg/kg/min IV), titrate up to sBP 90-100 mmHg
    - ASA 160 mg chew and swallow
- treat precipitating factor (See side bars for common precipitants)
- cardiology or medicine consult

#### Causes of CHF Exacerbation

##### FAILURE

Forgot medication  
 Arrhythmia (Dysrhythmia)/Anemia  
 Ischemia/Infarction/Infection  
 Lifestyle (e.g. too much salt)  
 Upregulation of cardiac output (pregnancy, hyperthyroidism)  
 Renal failure  
 Embolism (pulmonary)

#### Hospital Management Required if:

- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring interventions
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

#### CHF on CXR

- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions

#### Acute Treatment of CHF

##### LMNOP

Lasix (furosemide)  
 Morphine  
 Nitroglycerine  
 Oxygen  
 Position (sit upright), Pressure (BiPAP)

#### Risk Factors for VTE

##### THROMBOSIS

Trauma, travel  
 Hypercoagulable, HRT  
 Recreational drugs (IVDU)  
 Old (age >60)  
 Malignancy  
 Birth control pill  
 Obesity, obstetrics  
 Surgery, smoking  
 Immobilization  
 Sickness (CHF, MI, nephrotic syndrome, vasculitis)

## DVT and Pulmonary Embolism

- see also [Respirology](#), R17

### Risk Factors

- Virchow's triad
  - alterations in blood flow (venous stasis)
  - injury to endothelium
  - hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors

## Presentation

- DVT: calf pain, leg swelling/erythema/edema, palpable cord on exam; can be asymptomatic
- PE: dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT/PE; investigation often needed (see Figures 11 and 12)
- calculate the PERC (PE rule out criteria) score to assess the need for PE work-up before assessing the likelihood of a PE (Wells criteria)

## Investigations (see Figures 11, 12 and 13)

- ECG and CXR are useful to look for other causes (e.g. ACS, pneumonia)
- D-dimer is only useful if it is negative in low risk patients (highly sensitive)
- ultrasound has high sensitivity and specificity for proximal clot but only 73% sensitivity for DVT below the knee (may need to repeat in 1 wk)
- CT angiography has high sensitivity and specificity for PE, may also suggest other etiology
- V/Q scan useful when CT angio not available, or patient unable to tolerate IV contrast (e.g. renal failure, allergy)

## Management of DVT/PE

- LMWH unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24h or enoxaparin 1.5 mg/kg SC q24h
- warfarin started at same time as LMWH (5 mg PO OD initially)
- LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
  - early ambulation with analgesia is safe if appropriately anticoagulated
- IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
- consider thrombolysis if extensive DVT or PE causing hemodynamic compromise
  - often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O<sub>2</sub>, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
  - consider referral to medicine for coagulopathy and malignancy work-up
- long term anticoagulation
  - if reversible risk factor: 3-6 mo of warfarin
  - idiopathic VTE: may need longer term warfarin (5 yr or more)

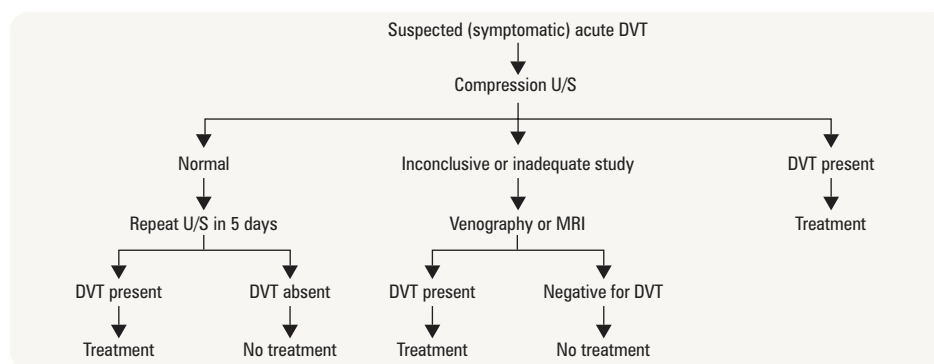

Figure 11. Approach to Suspected DVT

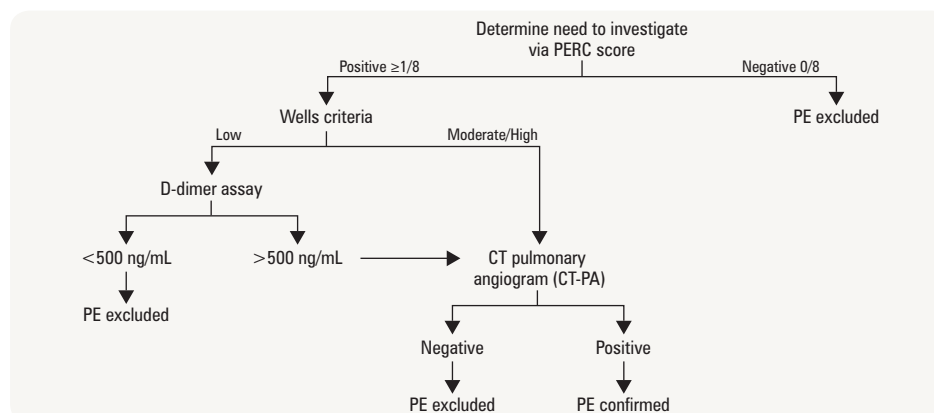

Figure 12. Approach to suspected PE

### PERC Score

- Age >50 yr
- HR >100 bpm
- O<sub>2</sub> sat on RA <94%
- Prior history DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score 0/8 means patient has <1.6% chance having a PE and avoids further investigation. It is important to note that this clinical score cannot be applied to pregnant women

### Pre-test Probability for DVT (Wells Score)

Active cancer	+1
Paralysis or immobilization	+1
Recently bedridden >3 d or surgery within 4 wk	+1
Localized tenderness in deep vein system	+1
Entire leg swollen	+1
Calf swelling >3 cm asymptomatic side	+1
Pitting edema on affected side	+1
Superficial (non-varicose) veins	+1
Alternative dx more likely than DVT	-2

0-1: DVT unlikely  
≥2: DVT likely

Adapted from Wells PS, Anderson DR, Bormanis J, et al. Value of assessment of pretest probability of deep-vein thrombosis in clinical management *Lancet* 2002;350:1795-1798

### Wells Criteria for PE

Previous Hx of DVT/emboli	+1.5
HR >100	+1.5
Recent immobility or Sx	+1.5
Clinical signs of DVT	+3
Alternate Dx less likely than PE	+3
Hemoptysis	+1
Cancer	+1

0-2: Low probability  
2-6: Intermediate probability  
>6: High probability

D-dimer is only useful if it is negative. Negative predictive value >99%.

50% of patients with symptomatic proximal DVT will develop PE, often within days to weeks of the event.

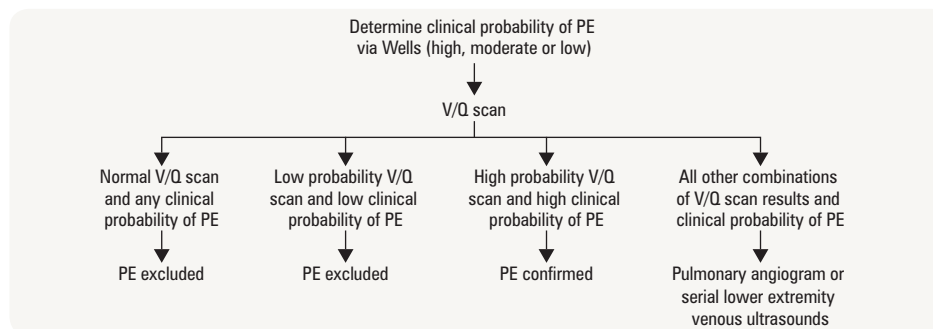

Figure 13. V/Q-based algorithm for suspected PE

#### Clinical Criteria to Prevent Unnecessary Diagnostic Testing in Emergency Department Patients with Suspected Pulmonary Embolism

*J Thromb Haemost* 2004;2:1247-1255

**Purpose:** To develop pulmonary embolism (PE) rule-out criteria (PERC) that can be used at the bedside, and prevents overtesting for PERC. Also, to prevent over-testing for PE, which includes the D-dimer test that frequently results in false positives.

**Study:** 21 variables were collected prospectively from 3148 ER patients evaluated for possible PE to develop rule-out criteria. The application of the developed rules was investigated in 1427 low-risk patients and 382 very low-risk patients.

**Results:** Eight variables were included in a block rule (age <50 yr, pulse <100 bpm, SaO<sub>2</sub> >94%, no unilateral leg swelling, no hemoptysis, no recent trauma or surgery, no prior PE or DVT, no hormone use) and a negative score was used to rule-out PE. In low-risk and very low-risk patients, the rule had a sensitivity of 96 and 100%, respectively and a specificity of 27 and 15%, respectively.

**Summary:** D-dimer testing for PE may not be favourable if all eight factors in the PERC are negative.

#### Precipitating Factors in DKA

##### The 5 Is

Infection  
Ischemia  
Infarction  
Intoxication  
Insulin missed

#### 4 Criteria for DKA Dx

- Hyperglycemia
- Metabolic acidosis
- Hyperketonemia
- Ketonuria

Cerebral edema may occur if hyperosmolality treated too aggressively.

## Diabetic Emergencies

- see also [Endocrinology](#), E11

### Diabetic Ketoacidosis (DKA)

- severe insulin deficiency resulting in hyperglycemia (11-55 mmol/L), dehydration and electrolyte abnormalities
- history and physical examination – often young, type 1 DM, may be first presentation of undiagnosed DM (may occur in small percentage of type 2 patients)
  - early symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - ♦ anorexia, nausea, vomiting, dyspnea (often due to acidosis), fatigue
    - ♦ abdominal pain
    - ♦ drowsiness, stupor, coma
    - ♦ Kussmaul's respiration
    - ♦ fruity acetone breath
- investigations
  - CBC, glucose, electrolytes, BUN/creatinine, Ca<sup>2+</sup>, Mg<sup>2+</sup>, phosphate, urine glucose and ketones
  - ABG
  - ECG (MI possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
  - rehydration
    - ♦ bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in pediatric patients)
    - ♦ beware of a pseudohyponatremia due to hyperglycemia (add 3 Na<sup>+</sup> per 10 glucose over 5.5 mmol/L)
  - potassium
    - ♦ essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial K<sup>+</sup> <5.5 mmol/L)
    - ♦ use cardiac monitoring if potassium levels normal or low
  - insulin
    - ♦ critical, as this is the only way to turn off gluconeogenesis/ketosis
    - ♦ do not give insulin if K<sup>+</sup> <3.3 mmol/L
    - ♦ initial bolus of 5-10 U short-acting/regular insulin (or 0.2 U/kg) IV in adults (controversial – may just start with infusion)
    - ♦ followed by continuous infusion at 5-10 U (or 0.1 U/kg) per hour
    - ♦ add D5W to IV fluids when blood glucose <15 mM to prevent hypoglycemia
  - bicarbonate is not given unless patient is at risk of death or shock (typically pH <7.0)

### Hyperosmolar Hyperglycemic State (HHS)

- state of extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, increased counter-regulatory hormones, gluconeogenesis, and dehydration (due to osmotic diuresis) in type 2 DM, high mortality (5-20%)
- history and physical examination
  - mental disturbances, coma, delirium, seizures
  - polyuria
  - nausea, vomiting
- investigations
  - CBC, electrolytes, creatinine, BUN, glucose, Mg<sup>2+</sup>, phosphate, urine glucose and ketones
  - ABG
  - ECG
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - O<sub>2</sub> and cardiac monitoring, frequent electrolyte and glucose monitoring
  - insulin as required
  - identify and treat precipitant if present (the 5 Is)

## Hypoglycemia

- very common ED presentation
- management focus
  - treatment of hypoglycemia
  - investigation of cause (most often due to exogenous insulin, alcohol, sulfonylureas)
- history and physical examination
  - last meal, known diabetes, prior similar episodes, drug therapy and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
- management
  - IV access and rapid blood glucose measurement
  - D50W 50 mL IV push, glucose PO if mental status permits
    - ♦ if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
  - O<sub>2</sub>, cardiac, frequent BG monitoring
  - thiamine 100 mg IM
  - full meal as soon as mental status permits
  - if episode due to long acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long t<sub>1/2</sub> (may require admission for monitoring)
  - search for cause

### Drugs Inducing Hypoglycemia

Insulin	Sulfa abx
Sulfonylureas	Clotrimazole
Ethanol	Ampicillin
Salicylates	Tetracycline
Acetaminophen	Amphetamines
NSAIDs	Cocaine
β-adrenergic agonists	Pyridoxine
Lithium	ACE-inhibitor
Calcium	Theophylline
MAOI	Quinine
Coumadin	

## Electrolyte Disturbances

- see [Nephrology](#), NP7 and [Endocrinology](#), E38

Table 16. Electrolyte Disturbances

Electrolyte Disturbance	Common Causes	Symptoms	Treatment	Special Considerations
<b>Hypernatremia</b>	Inadequate H <sub>2</sub> O intake (elderly/disabled) or inappropriate excretion of H <sub>2</sub> O (diuretics, Li and DI)	Lethargy, weakness, irritability, and edema. Seizures and coma occur with severe elevations of Na <sup>+</sup> levels (> 158 mmol/L)	Salt restrict and give free water	No more than 12 mmol/L in 24 h drop in Na <sup>+</sup> (0.5 mmol/L/h) due to risk of cerebral edema, seizures, death
<b>Hypонатremia</b>	Hypo-osmolar (dilutional e.g. CHF, cirrhosis, ascites) and hyper-osmolar (usually glucose)	Acute: Neurologic symptoms 2° to cerebral edema, headache, decreased LOC, depressed reflexes	Water restrict Acute: correct rapidly 3% NaCl 1-2 cc/kg/h Chronic: IV NS + furosemide	Limit total rise to 8 mmol/L in 24 h (0.5 mmol/L/h maximum) as patients are at risk of central pontine myelinolysis
<b>Hyperkalemia</b>	Rhabdomyolysis, insulin deficiency, metabolic acidosis	Nausea, palpitations, muscle stiffness, areflexia	Protect heart: Calcium gluconate Shift K <sup>+</sup> into cells: Insulin R, NaHCO <sub>3</sub> , salbutamol	ECG: Peaked/narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, AV block, V fib
<b>Hypokalemia</b>	Metabolic alkalosis, insulin, diuretics, anorexia, salbutamol	Nausea, vomiting, fatigue, muscle cramps, constipation	K-Dur®, K <sup>+</sup> sparing diuretics, IV solutions with 20-40 mEq KCl per liter over 3-4 h	ECG: U waves most important, flattened/ inverted T waves, prolonged QT, depressed ST May need to restore Mg <sup>2+</sup>
<b>Hypercalcemia</b>	Hyper-PTH and malignancy account for approx. 90% of cases	Multisystem including CVS, GI (groans), renal (stones), rheumatological, MSK (bones), psychiatric (moans)	Isotonic saline + furosemide if hypervolemic Bisphosphonates, dialysis, chelation (EDTA or oral phosphate)	Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy
<b>Hypocalcemia</b>	Iatrogenic, low Mg <sup>2+</sup> , liver dysfunction, 1° hypo-PTH	Laryngospasm, hyperreflexia, parasthesia, tetany, Chvostek's and Trousseau's sign	Acute (ionized Ca <sup>2+</sup> <0.7 mM) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion	Prolonged QT interval can arise leading to dysrhythmias as can upper airway obstruction

## Hypertensive Emergencies

### Hypertensive Emergency (Hypertensive Crisis)

#### Etiology

- essential hypertension, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy

#### Presentation

- elevation of systolic and diastolic BP (irrespective of BP) with acute end-organ damage (CNS, renal, CVS, retinal)

**HELLP Syndrome** (seen only in preeclampsia/eclampsia)  
**H**emolytic anemia  
**E**levated Liver enzymes  
**L**ow Platelet count

### Catecholamine Induced Hypertensive Emergencies

Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed.

**Table 17. Signs and Symptoms of Hypertensive Emergencies**

	Central Nervous System	Retinal	Renal	Cardiac	Gastrointestinal
<b>Complication</b>	Stroke/TIA, headache, altered mental status, seizures, hemorrhage	Vision change, hemorrhage, exudates, papilledema	Nocturia, elevated creatinine, proteinuria, hematuria, oliguria	Ischemia/angina, infarct, dissection (back pain), congestive heart failure	Nausea, vomiting, abdominal pain, elevated liver enzymes

**Investigations**

- CBC, electrolytes, BUN, creatinine, urinalysis
- peripheral blood smear: to detect microangiopathic hemolytic anemia
- CXR: if SOB or chest pain
- ECG, troponins, CK: if chest pain
- CT head: if neurological findings or severe headache
- toxicology screen if sympathomimetic overdose suspected

**Management**

- in general, the strategy for management is to gradually and progressively reduce blood pressure in 24-48 h. Refer to Table 18 for common agents
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol) or adjusting antihypertensive
  - if preeclampsia, immediately consult OB/GYN (see [Obstetrics](#), OB16)
  - transfer to ICU for further reduction in BP under monitored setting
- in case of ischemic stroke: do not rapidly reduce blood pressure, maintain BP above 150/100 for 5 d
- in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
- in case of excessive catecholamines: avoid  $\beta$ -blockers (except labetalol)
- in case of acute coronary syndrome: address ischemia initially, then BP

**Hypertensive Urgency**

- definition: severely elevated blood pressure (usually sBP >180, dBP >115) with no evidence of end-organ damage
- most commonly due to non-adherence with medications
- treatment: initiate/adjust antihypertensive therapy, monitor in ED (up to 6 h) and discharge with follow up for 48-72 h
- goal: differentiate hypertensive emergencies from hypertensive urgencies

**Table 18. Most Commonly Used Agents for the Treatment of Hypertensive Crisis**

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
<b>VASODILATORS</b>					
Sodium Nitroprusside (vascular smooth muscle dilator) 1st line	0.25-10 $\mu$ g/kg/min	Immediate	3-5 min	N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome	Most hypertensive emergencies (especially CHF, aortic dissection) Use in combination with $\beta$ -blockers (e.g. esmolol) in aortic dissection Caution with high ICP and azotemia
Nicardipine (CCB)	2 mg IV bolus, then 4 mg/kg/h IV	15-30 min	40 min	Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, RF, eclampsia, sympathetic crisis)	Most hypertensive emergencies Caution with acute CHF
Fenoldopam Mesylate (dopamine receptor antagonist)	0.05-0.1 $\mu$ g/kg/min IV	<5 min	8-10 min	Tachycardia, headache, nausea, flushing (e.g. acute RF)	Most hypertensive emergencies Caution with glaucoma
Enalapril (ACEI)	0.625-1.25 mg IV q6h	15-30 min	12-24 h	Theoretical fall in pressure in high renin states not seen in studies	Acute LV failure Avoid in acute MI, pregnancy, acute RF
Nitroglycerin	5-20 $\mu$ g/min IV	1-2 min	3-5 min	Hypotension, bradycardia, headache, lightheadedness, dizziness	MI/pulmonary edema
Hydralazine	5-10 mg IV/IM q20min (max 20 mg)	5-20 min	2-6 h	Dizziness, drowsiness, headache, tachycardia, $\text{Na}^+$ retention	Eclampsia

**Signs/Symptoms of CNS Hypertensive Emergency**

- Nausea and vomiting
- Seizure
- Headache or altered mental status
- Cushing response

With CNS manifestations of severe hypertension, it is often difficult to differentiate causal relationships [i.e. hypertension could be secondary to primary cerebral event (Cushing effect)].

Most commonly used agents for hypertensive crisis are labetalol and nitroprusside.

**Drugs that Increase Adrenergic Stimulation**

- MAOIs
- TCAs
- Amphetamines
- Cocaine

**Table 18. Most Commonly Used Agents for the Treatment of Hypertensive Crisis** (continued)

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
<b>ADRENERGIC INHIBITORS</b>					
Labetalol	20 mg IV bolus q10min or 0.5-2 mg/min	5-10 min	3-6 h	Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension	Most hypertensive emergencies (esp. eclampsia) Avoid in acute CHF; heart block >1st degree
Esmolol	250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat	1-2 min	10-20 min	Hypotension, nausea, bronchospasm	Aortic dissection, acute MI SVT dysrhythmias, perioperative HTN Avoid in acute CHF; heart block >1st degree
Phentolamine	5-15 mg q5-15min	1-2 min	3-10 min	Tachycardia, headache, flushing	Catecholamine excess (e.g. pheochromocytoma)

\*Hypotension may occur with all of these agents

## Stroke

- see [Neurology](#), N43
- can be ischemic (80% of all strokes) or hemorrhagic

### Presentation

- sudden onset persisting neurological deficits

**Table 19. Signs and Symptoms of Stroke**

	General	Language/throat	Vision	Cordination	Motor	Sensation	Reflex
<b>Sign/symptoms</b>	Decreased LOC, changed mental status, confusion, neglect	Dysarthria, aphasia, swallowing difficulty	Diplopia, eye deviation, asymmetric pupils, visual field defect	Ataxia, intention tremor, lack of coordination	Increased tone, loss of power, spasticity	Loss of sensation	Hyper reflexia, clonus

Note: headache is variable

- patients with hemorrhagic stroke can present with sudden onset thunderclap headache that is usually described as “worst headache in my life”
- constellation of neurological deficits can point to certain vascular territories (Table 20)
- stroke mimics: seizure, migraine, hypoglycemia, Todds paralysis, peripheral nerve injury, Bell's palsy, tumour, syncope

**Table 20. Stroke Syndromes**

Region of Stroke	Stroke Syndrome
Anterior Cerebral Artery	Primarily frontal lobe function affected  Altered mental status, impaired judgment, contralateral lower extremity weakness and hypoesthesia, gait apraxia
Middle Cerebral Artery	Contralateral hemiparesis (arm and face weakness > leg weakness) and hypoesthesia, ipsilateral hemianopsia, gaze preference to side of lesion ± agnosia, receptive/expressive aphasia
Posterior Cerebral Artery	Affects vision and thought  Homonymous hemianopsia, cortical blindness, visual agnosia, altered mental status, impaired memory
Vertebrobasilar Artery	Wide variety of CN, cerebellar and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypoesthesia, syncope, ataxia Loss of pain and temperature sensation ipsilateral face and contralateral body

### Investigations

- CBC, electrolytes, blood glucose, coagulation studies, ± cardiac biomarkers, ± toxicology screen
- non-contrast CT head: look for hemorrhage, ischemia
- ECG ± echocardiogram: rule out atrial fibrillation, acute MI as source of emboli
  - other imaging: carotid dopplers, CTA, MRA as appropriate

If patient presents within 4.5 h of onset of disabling neurological deficits greater than 60 min with no signs of resolution, they may be a candidate for thrombolysis. Do brief assessment and order stat CT head.

#### Exclusion Criteria for tPA:

- Suspected subarachnoid hemorrhage
- Previous intracranial hemorrhage
- Cerebral infarct or severe head injury within the past 3 mo
- Recent pericarditis
- Major surgery within the past 14 d
- GI or urinary hemorrhage within the past 21 d
- Recent lumbar puncture or arterial puncture at noncompressible site
- Patient is pregnant
- BP >185 mmHg systolic, or >110 mmHg diastolic
- Bleeding diathesis
- Prolonged PTT (more than 40 s) or INR >1.4
- Platelet count <100,000
- Blood glucose <2.8 or >22 mmol/L
- Intracranial hemorrhage on CT or large volume infarct
- Seizure at onset causing deficit
- Previously ADL dependent (clinical judgment)

#### Differentiation of UMN Disease versus LMN Disease

Category	UMN Disease	LMN Disease
Muscular deficit	Muscle groups	Individual muscles
Reflexes	Increased	Decreased/absent
Tone	Increased	Decreased
Fasciculations	Absent	Present
Atrophy	Absent/minimal	Present
Babinski	Upgoing	Downgoing

## Management

- thrombolysis: immediate assessment for eligibility. Need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
- intubation with RSI if GCS  $\leq 8$ , rapidly decreasing GCS, or inadequate airway protection reflexes
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV  $\pm$  cardiac monitoring
  - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
- BP control: only treat severe hypertension (sBP >200, dBP >120, mean arterial BP >140) or hypertension associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
- glycemic control: keep fasting glucose less than 6.5 in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

## Medications

- acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antiplatelet agents: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin<sup>®</sup> (1<sup>st</sup>-line); clopidogrel, Aggrenox<sup>®</sup> (2<sup>nd</sup>-line)
- anticoagulation: DVT prophylaxis if immobile; treat atrial fibrillation if present

### 7 Causes of Emboli from the Heart

- Atrial fibrillation
- MI
- Endocarditis
- Valvular disease
- Dilated cardiomyopathy
- Left heart myxoma
- Prosthetic valves

### Causes of Acute Ataxia

#### UNABLE TO STAND

Underlying weakness (mimic ataxia)  
Nutritional neuropathy (vitamin B<sub>12</sub> deficiency)

Arteritis/vasculitis

Basilar migraine

Labyrinthitis/vestibular neuronitis

Encephalitis/infection

Trauma (post-concussive)

Other (rare genetic or metabolic disease)

Stroke (ischemia or hemorrhage)

Toxins (drugs, toluene, mercury)

Alcohol

Neoplasm/paraneoplastic syndrome

Demyelination (Miller Fisher, Guillain Barré, MS)

Vaginal bleeding can be life threatening. Always start with ABCs and ensure your patient is stable.

Need  $\beta$ -hCG  $\geq 1200$  to see intrauterine changes on transvaginal U/S.

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using IVF.

# Gynecologic/Urologic Emergencies

## Vaginal Bleed

- see [Gynecology](#), GY6 and [Obstetrics](#), OB22

## Etiology

- pregnant patient
  - 1st/2<sup>nd</sup> trimester pregnancy: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  - 2<sup>nd</sup>/3<sup>rd</sup> trimester pregnancy: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
  - dysfunctional uterine bleeding, uterine fibroids, pelvic tumours, trauma, endometriosis, PID, exogenous hormones

## History

- characterize bleeding (frequency, duration, number of pads/tampons, cyclicity)
- pain (if present OPQRSTU)
- menstrual history, sexual history, STI history, syncope/pre-syncope
- details of pregnancy including gush of fluid and fetal movement (>20 wk)

## Physical Examination

- ABC (especially noting postural BP/HR and mucous membrane)
- abdominal examination (peritoneal signs, tenderness, distention, mass)
- speculum examination (NOT IF 2<sup>nd</sup>/3<sup>rd</sup> trimester bleeding. Perform only when placenta previa is ruled out with ultrasound)
  - look for active bleeding, trauma/anomaly, and cervical dilatation
  - use sterile speculum if pregnant
- bimanual examination (cervical tenderness, size of uterus, cervical length/dilatation)
  - sterile gloves if pregnant

## Investigations

- $\beta$ -hCG test for all patients with child-bearing potential
- CBC, blood and Rh type, quantitative  $\beta$ -hCG, PTT, INR
- type and cross if significant blood loss
- transvaginal ultrasound (rule out ectopic pregnancy and spontaneous abortion)
- abdominal ultrasound (rule out placenta previa and fetal demise)
- postpartum
  - U/S for retained products
  - $\beta$ -hCG if concerned about retained tissue

## Management

- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
- 1<sup>st</sup>/2<sup>nd</sup> trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
  - U/S indeterminate or  $\beta$ -hCG >1000-2000 IU: further work-up and/or gynecology consult
  - abortions: if complete, discharge if stable; for all others, acquire gynecology consult
- 2<sup>nd</sup>/3<sup>rd</sup> trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type and cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - dysfunctional uterine bleeding (prolonged or heavy flow  $\pm$  breakthrough bleeding and without ovulation, a diagnosis of exclusion)
    - ♦ <35-40 yr of age: Provera® 10 mg PO OD x 10 d, warn patient of a withdrawal bleed, discharge if stable
    - ♦ if unstable, admit for IV hormonal therapy, possible D&C
    - ♦ >35-40 yr of age: uterine sampling necessary prior to initiation of hormonal treatment to rule out endometrial cancer, U/S for any masses felt on exam
    - ♦ tranexamic acid (Cyklokapron®) to stabilize clots
  - structural abnormalities: fibroids or uterine tumours may require excision for diagnosis/treatment, U/S for workup of other pelvic masses, Pap smear/biopsy for cervical lesions

## Disposition

- the decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult gynecology for admitted patients
- if patient can be safely discharged, ensure follow up with family physician or gynecologist
  - instruct patient to return to emergency for increased bleeding, presyncope

### Classifying Miscarriage (abortion):

**Missed:** non-viable intrauterine pregnancy

**Threatened:** viable intrauterine pregnancy with os closed

**Inevitable:** os closed, no products of conception passed

**Incomplete:** products of conception partially expelled

**Complete:** products of conception completely expelled

**Septic:** any of above with presence of infection (usually incomplete)

**Recurrent:** >3 spontaneous abortions (recurrent pregnancy loss)

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients.

Ensure appropriate support is provided.

## Pregnant Patient in the ER

Table 21. Complications of Pregnancy

Trimester	Fetal	Maternal
First 1-12 wk	Pregnancy failure <ul style="list-style-type: none"> <li>• Spontaneous abortion</li> <li>• Fetal demise</li> <li>• Gestational trophoblastic disease</li> </ul>	Ectopic pregnancy Anemia Hyperemesis gravidarum UTI/pyelonephritis
Second 13-27 wk	Disorders of fetal growth <ul style="list-style-type: none"> <li>• IUGR</li> <li>• Oligo/polyhydramnios</li> </ul>	Gestational diabetes mellitus Rh incompatibility UTI/pyelonephritis
Third 28-41 wk	Vasa previa	Preterm labour/PPROM Preeclampsia/eclampsia Placenta previa Placental abruption Uterine rupture DVT

## Nephrolithiasis (Renal Colic)

- see [Urology](#), U16

### Epidemiology and Risk Factors

- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

### Clinical Features

- urinary obstruction  $\rightarrow$  upstream distention of ureter or collecting system  $\rightarrow$  severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, never comfortable, nausea, vomiting, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

### Kidney Stones

- 80% Calcium
- 10% Struvite
- 10% Uric acid

### Differential Diagnosis of Renal Colic

- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

### Investigations

- screening
  - CBC → elevated WBC in presence of fever suggests infection
  - electrolytes, Cr, BUN → to assess renal function
  - urinalysis: R&M (WBCs, RBCs, crystals), C&S
- imaging
  - non-contrast spiral CT is the study of choice
  - abdominal ultrasound may demonstrate stone or hydronephrosis (consider in females of child bearing age)
  - abdominal x-ray will identify large radiopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones or stones overlying bony structures. Consider as an initial investigation in patients who have a history of radiopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine → stone analysis

### Management

- analgesics: NSAIDs [usually ketorolac (Toradol®) preferable over opioids], antiemetics, IV fluids
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) helpful to increase stone passage in select cases

### Disposition

- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and is able to tolerate oral medications
- may advise hydration, and limitation of protein, sodium, oxalate and alcohol intake

#### Indications for Admission to Hospital

- Intractable pain
- Fever (suggests infection) or other evidence of pyelonephritis
- Single kidney with ureteral obstruction
- Bilateral obstructing stones
- Intractable vomiting
- Compromised renal function

ALWAYS assess visual acuity in both eyes when a patient presents to the ER with an ophthalmologic complaint.

Any etiology of red eyes may also present with blurred vision.

#### Other Ophthalmologic Emergencies (See also [Ophthalmology](#), OP5)

**Infectious:** Red eye (Table 22), endophthalmitis, hypopyon.

**Trauma:** Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphema, lens dislocation, retrolental hemorrhage.

**Painful vision loss:** Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrolental hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis.

**Painless vision loss:** Central retinal vein occlusion, amaurosis fugax, occipital stroke.

#### Contraindications to Pupil Dilation

- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Caution with CV disease – mydriatics can cause tachycardia

## Ophthalmologic Emergencies

- see also [Ophthalmology](#), OP17

### History/Physical

- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital x-rays, ultrasound, or CT scan to exclude presence of intraocular metallic foreign body
- see Table 22 for important considerations of red eye in the emergency department
- visual acuity in both eyes, pupils, extraocular structures, fundoscopy, tonometry, slit lamp exam

### Management of Ophthalmologic Foreign Body

- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

**Table 22. Differential Diagnosis of Red Eye in the Emergency Department**

Symptom	Possible Serious Etiology
Light sensitivity	Iritis, keratitis, abrasion, ulcer
Unilateral	Above + herpes simplex, acute angle closure glaucoma
Significant pain	Above + scleritis
White spot on cornea	Corneal ulcer
Blurred vision	All of the above
Non-reactive pupil	Acute glaucoma, iritis
Copious discharge	Gonococcal conjunctivitis
Blurred vision	All of the above

**Table 23. Select Ophthalmologic Emergencies**

Condition	Signs and Symptoms	Management
<b>Acute angle closure glaucoma</b>	Unilateral red, painful eye Decreased visual acuity, halos around lights Fixed, mid-dilated pupil Nausea, vomiting Marked increase in IOP (>40 mmHg) Shallow anterior chamber $\pm$ cells	Ophthalmology consult for laser iridotomy Topical $\beta$ -blockers, adrenergics and cholinergics Systemic carbonic anhydrase inhibitors and hyperosmotic agents
<b>Chemical burn</b>	Known exposure to acids or alkali (worse) Pain, decreased visual acuity Vascularization or defects of cornea Iris and lens damage	Irrigate at site of accident IV NS drip in ED with eyelid retracted Swab fornices Cycloplegic drops Topical antibiotics and patching
<b>Orbital cellulitis</b>	Red, painful eye, decreased visual acuity Headache, fever Lid erythema, edema and difficulty opening eye Conjunctival injection and chemosis Proptosis, ophthalmoplegia $\pm$ RAPD	Admission, ophthalmology consult Blood cultures, orbital CT IV antibiotics (ceftriaxone+ vancomycin) Drainage of abscess
<b>Retinal artery occlusion</b>	Sudden, painless, monocular vision loss RAPD Cherry red spot and retinal pallor on fundoscopy	Restore blood flow <2 h Massage globe Decreased IOP (topical $\beta$ -blockers, inhaled $O_2/CO_2$ mix, IV Diamox <sup>®</sup> , IV mannitol, drain aqueous fluid)
<b>Retinal artery detachment</b>	Flashes of light, floaters, curtains of blackness/ peripheral vision loss Painless Loss of red reflex, decreased IOP Detached areas are grey $\pm$ RAPD	Ophthalmology consult for scleral buckle/ pneumatic retinoplexy

## Dermatologic Emergencies

### Life Threatening Dermatoses

#### Rash Characteristics

##### A. Diffuse Rashes

- staphylococcal scalded skin syndrome (SSSS)
  - ♦ caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
  - ♦ mostly occurs in children
  - ♦ prodrome: fever, irritability, malaise and skin tenderness
  - ♦ sudden onset of diffuse erythema: skin is red, warm, and very tender
  - ♦ flaccid bullae that are difficult to see, then desquamate in large sheets
  - ♦ Nikolsky's sign: gentle lateral stroking of skin causes epidermis to separate
- toxic epidermal necrolysis (TEN) [ $>30\%$  of Body SA]
  - ♦ see also [Dermatology](#), D22
  - ♦ caused by drugs (e.g. phenytoin, sulfas, penicillins and NSAIDs), bone marrow transplantation, blood product transfusions
  - ♦ usually occurs in adults
  - ♦ diffuse erythema followed by necrosis
  - ♦ severe mucous membrane blistering
  - ♦ entire epidermis desquamation
  - ♦ high mortality ( $>50\%$ )
- toxic shock syndrome (TSS)
  - ♦ see also [Infectious Diseases](#), ID26
  - ♦ caused by superantigen from *S. aureus* or GAS activating T-cell and cytokines
  - ♦ patient often presents with onset of shock and multi-organ failure, fever
  - ♦ diffuse erythematous macular rash
  - ♦ at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, skin (necrotizing fasciitis, gangrene)
- vesicobullous lesions
  - erythema multiforme (EM)
    - ♦ see [Dermatology](#), D22
    - ♦ immunologic reaction to herpes simplex
    - ♦ viral prodrome 1-14 d before rash
    - ♦ "target lesion": central grey bulla or wheal surrounded by concentric rings of erythema and normal skin

- Stevens-Johnson syndrome (SJS) [ $<10\%$  of Body SA]
  - ♦ see also [Dermatology](#), D22
  - ♦ related to drugs such as antiepileptics and biologic agents, e.g. infliximab
  - ♦ EM with constitutional symptoms and mucous membrane involvement (milder mucous membrane involvement than TEN)

## B. Discrete Lesions

- pyoderma gangrenosum
  - ♦ often associated with immunocompromised patients (HIV, leukemia or lymphoma) with Gram-negative sepsis
  - ♦ often occurs in arms, hands, feet, or perineal region
  - ♦ usually begins as painless macule/vesicle  $\rightarrow$  pustule/bulla on red/blue base  $\rightarrow$  sloughing, leaving a gangrenous ulcer
- disseminated gonococcal infection (DGI)
  - ♦ see also [Dermatology](#), D32
  - ♦ fever, skin lesions (pustules/vesicles on erythematous base  $\sim 5$  mm in diameter), arthritis (joint swelling and tenderness), septic arthritis (in larger joints, e.g. knees, ankles and elbows)
  - ♦ most commonly in gonococcus positive women during menstruation or pregnancy
  - ♦ skin lesions usually appear in extremities and resolve quickly ( $<7$  d)
- meningococcemia
  - ♦ flu-like symptoms of headache, myalgia, nausea and vomiting
  - ♦ petechial, macular or maculopapular lesions with grey vesicular centres
  - ♦ usually a few millimeters in size but may become confluent and hemorrhagic
  - ♦ usually appear in extremities but may appear anywhere
  - ♦ look for signs of meningeal irritation: Brudzinski, Kernig, nuchal rigidity, jolt accentuation

## History and Physical Examination

- determine onset, course, location of skin lesions
- fever, joint pain
- associated symptoms: CNS, resp, GU, GI, renal, liver, mucous membranes
- medication history
- vitals

## Investigations

- immediate consultation if patient unstable
- CBC, electrolytes, creatinine, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

## Management

- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI and meningococcemia
    - ♦ IV antibiotics
  - EM, SJS, and TEN
    - ♦ stop precipitating medication
    - ♦ fluids
    - ♦ symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IVIG
    - ♦ TEN: debride necrotic tissue

## Disposition

- most cases will require urgent care and hospitalization
- TEN: early transfer to burn centre improves outcome

Thorough dermatologic examinations are required; examination of asymptomatic skin may identify more lesions! Ensure adequate draping during dermatologic examinations.

# Environmental Injuries

## Heat Exhaustion and Heat Stroke

- predisposing factors: young persons who overexert themselves, older adults who cannot dissipate heat at rest (e.g. using anticholinergic drugs such as antihistamines or TCAs), and patients with schizophrenia who are using anticholinergic or neuroleptic medications

### Heat Exhaustion (HE)

- clinical features relate to loss of circulating volume caused by exposure to heat stress
- “water depletion”: HE occurs if lost fluid not adequately replaced
- “salt depletion”: HE occurs when losses replaced with hypotonic fluid

Heat exhaustion (HE) may closely resemble heat stroke. HE may eventually progress to heat stroke, therefore, if diagnosis is uncertain treat as heat stroke.

## Heat Stroke

- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes (see Table 24)
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, other infections)

**Table 24. Heat Exhaustion vs. Heat Stroke**

	Heat Exhaustion	Classical Heat Stroke	Exertional Heat Stroke
<b>Clinical Features</b>	<ul style="list-style-type: none"> <li>• Non-specific malaise, headache, fatigue</li> <li>• Body temp <math>&lt;40.5^{\circ}\text{C}</math> (usually normal)</li> <li>• No coma or seizures</li> <li>• Dehydration (<math>\uparrow</math> HR, orthostatic hypotension)</li> </ul>	<ul style="list-style-type: none"> <li>• Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation)</li> <li>• Often patients are older, poor, and sedentary or immobile</li> <li>• Dry, hot skin</li> <li>• Temp usually <math>&gt;40.5^{\circ}\text{C}</math></li> <li>• Altered mental status, seizures, delirium, coma</li> <li>• May have elevated AST, ALT</li> </ul>	<ul style="list-style-type: none"> <li>• Occurs with high endogenous heat production (e.g. exercise) and overwhelmed homeostatic mechanisms</li> <li>• Patients often younger, more active</li> <li>• Skin often diaphoretic</li> <li>• Other features as for classical HS, but may also have DIC, acute renal failure, rhabdomyolysis, marked lactic acidosis</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>• Rest in a cool environment</li> <li>• Normal saline IV if orthostatic hypotension; otherwise replace losses slowly PO</li> </ul>	<ul style="list-style-type: none"> <li>• Cool body temperature with water mist (e.g. spray bottle) and standing fans</li> <li>• Ice water immersion also effective; monitor body temp closely to avoid hypothermic overshoot</li> <li>• Secure airway because of seizure and aspiration risk</li> <li>• Give fluid resuscitation if still hypotensive after above therapy</li> <li>• Avoid <math>\alpha</math>-agonists (e.g. epinephrine) peripheral vasoconstriction and antipyretics (e.g. ASA)</li> </ul>	

## Hypothermia and Cold Injuries

### HYPOTHERMIA

- predisposing factors: extremes of age, lack of housing, drug overdose, EtOH ingestion, trauma (incapacitating), cold water immersion, outdoor sports
- treatment based on: (a) re-warming (b) supporting cardiorespiratory function
- complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume and electrolyte depletion
- labs: CBC, electrolytes, ABG, serum glucose, creatinine/BUN,  $\text{Mg}^{2+}$ ,  $\text{Ca}^{2+}$ , amylase, coagulation profile
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

**Table 25. Classification of Hypothermia**

Class	Temp	Symptoms/Signs
<b>Mild</b>	$32\text{--}34.9^{\circ}\text{C}$	Tachypnea, tachycardia, ataxia, dysarthria, shivering
<b>Moderate</b>	$28\text{--}31.9^{\circ}\text{C}$	Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behaviour, muscle rigidity, dilated pupils
<b>Severe</b>	$<28^{\circ}\text{C}$	Coma, hypotension, acidemia, ventricular fibrillation, asystole, flaccidity, apnea

### Re-warming Options

- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- Passive External Re-warming (PER)
  - suitable for most stable patients with core temperature  $>32.2^{\circ}\text{C}$
  - involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
- Active External Re-warming (AER)
  - involves use of warming blankets
  - beware of “afterdrop” phenomenon
  - safer when done in conjunction with active core re-warming
- Active Core Re-warming (ACR)
  - generally for patients with core temperature  $<32.2^{\circ}\text{C}$ , and/or with cardiovascular instability
  - avoids “afterdrop” seen with AER alone
  - re-warm core by using
    - ♦ warmed humidified oxygen, IV fluids
    - ♦ peritoneal dialysis with warm fluids
    - ♦ gastric/colonic/pleural irrigation with warm fluids
    - ♦ external circulation (cardiopulmonary bypass machine) is most effective, fastest

#### Afterdrop Phenomenon

Warming of extremities causes vasodilation and movement of cool pooled blood from extremities to core, resulting in a drop in core temperature  $\rightarrow$  cardiac arrest.

### Approach to Cardiac Arrest in the Hypothermic Patient

- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- **if any pulse at all (even very slow) do NOT do CPR**
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature  $<30^{\circ}\text{C}$
- intubate if required, ventilate with warmed, humidified  $\text{O}_2$
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures
  - controversial; may try one dose
- focus of treatment is re-warming

### FROSTBITE

#### Classification

- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
- 1st degree
  - symptoms: initial paresthesia, pruritus
  - signs: erythema, edema, hyperemia, no blisters
- 2nd degree
  - symptoms: numbness
  - signs: blistering (clear), erythema, edema
- 3rd degree
  - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
  - signs: hemorrhagic blisters, skin necrosis, edema, no movement

#### Management

- treat for hypothermia:  $\text{O}_2$ , IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in  $40\text{--}42^{\circ}\text{C}$  agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area, leave injured region open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frost bite injury at high risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

#### Burn Causes

- Thermal (flame, scald)
- Chemical
- Radiation (UV, medical/therapeutic)
- Electrical

Use palm of the patient's hand to estimate 1% of BSA affected.

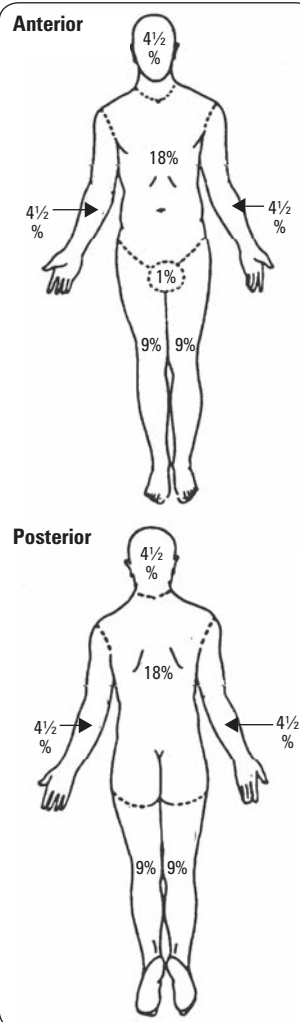

Figure 14. Rule of 9s for total body surface area (BSA)

Intubate early if you suspect inhalation injury, as airway can become obstructed due to edema.

## Burns

- see [Plastic Surgery](#), PL16

#### Physical Examination

- burn size
  - rule of nines (see Figure 14); does not include 1st degree burns
- burn depth
  - superficial: epidermis only (e.g. sunburn)
  - partial thickness: into superficial dermis deep or hair follicles, sweat glands
  - full thickness: all layers of the skin
  - deep: involvement of fat, muscle, even bone

#### Management

- remove noxious agent/stop burning process
- establish airway if needed (indicated with burns  $>40\%$  BSA or smoke inhalation injury)
- resuscitation for 2<sup>nd</sup> and 3<sup>rd</sup> degree burns (after initiation of 2 large bore IVs)
- fluid boluses if unstable
  - Parkland Formula: Ringer's lactate 4 cc/kg/%BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  - urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics
- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, urinalysis, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, systemic antibiotics infrequently indicated
- tetanus prophylaxis if burn is deeper than superficial dermis

#### Disposition

- admit
  - 2<sup>nd</sup> degree burns  $>10\%$  BSA; any significant 3<sup>rd</sup> degree burns
  - 2<sup>nd</sup> degree on face, hands, feet, perineum or across major joints
  - electrical, chemical burns and inhalation injury
  - burn victims with underlying medical problems or immunosuppressed patients

## Inhalation Injury

### Etiology

- carbon monoxide (CO), cyanide (CN) poisoning
- direct thermal injury: limited to upper airway
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

### History and Physical

- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin (unreliable, usually post-mortem finding)
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO<sub>2</sub> normal but O<sub>2</sub> saturation low suggests CO poisoning

### Investigations

- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

### Management

- CO poisoning: 100% O<sub>2</sub> ± hyperbaric O<sub>2</sub> (controversial)
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators

## Bites

### MAMMALIAN BITES

- see [Plastic Surgery](#), PL10

### History

- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, rabies risks, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, “fight bites”

### Physical Examination

- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status

### Investigations

- if bony injury or infection suspected check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds, ± CT to rule out cranial perforation

### Initial Management

- wound cleansing and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
- culture wound if signs of infection (erythema, necrosis or pus); obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound

### Prophylactic Antibiotics

- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present (efficacy not proven)
- dog and cat bites (pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*)
  - 80% of cat bites, 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid
- human bites (pathogens: *Eikenella corrodens*, *S. aureus*, *S. viridans*, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
- rabies (see [Infectious Diseases](#), ID21)
  - reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence
- suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands and feet) to heal by secondary intention
  - tetanus immunization if >10 yr or incomplete primary series

#### High Risk Criteria for Infection

##### Wound Factors

- Puncture wounds
- Crush injuries
- Wounds > 12 h old
- Hand or foot wounds
- Wounds near joints

##### Patient Factors

- Immunocompromised
- Age > 50 yr
- Prosthetic joints or valves

#### Consider Admission if:

- Moderate to severe infections
- Infections in immunocompromised patients
- Not responding to oral Rx
- Penetrating injuries to tendons, joints, CNS
- Open fractures

**SNAKE BITES**

- history, physical exam, investigations and initial management similar to mammalian bites
- additional management issues
  - snake bites are rarely fatal but proper precautions must be taken
  - supportive management, observe for compartment syndrome, analgesia, tetanus prophylaxis
  - contact Provincial Poison Information Centre for consultation
  - for the Massasauga Rattle Snake ONLY: if no signs of local tissue damage AND an INR is normal at 6 h after the bite, the patient may be discharged
  - there is NO evidence that constriction bands are helpful AND can be harmful
- if envenomation present, administer antivenom as directed by local Poison Information Centre

**INSECT BITES**

- bee stings
  - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  - history and physical exam key to diagnosis; no lab test will confirm
  - investigations: CBC, electrolytes, BUN, creatinine, glucose, ABGs, ECG
  - ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids,  $\beta$ -agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
- West Nile virus (see [Infectious Diseases](#), ID27)

## Near Drowning

- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

**Physical Examination**

- ABCs, vitals: watch closely for hypotension
- lungs: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
- H&N: assess for C-spine injuries
- neuro: GCS or AVPU, pupils, focal deficits

**Investigations**

- labs: CBC, electrolytes, ABGs, Cr, BUN, urinalysis
- imaging: CXR (pulmonary edema, pneumothorax)
- ECG

**Management**

- ABCs, treat for trauma, shock, hypothermia
- cardiac and O<sub>2</sub> sat monitors, IV access
- intensive respiratory care
  - ventilator assistance if decreased respirations, pCO<sub>2</sub> >50 mmHg, or pO<sub>2</sub> <60 mmHg on maximum O<sub>2</sub>
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow O<sub>2</sub>/CPAP/BiPAP may be adequate but some may need mechanical ventilation with PEEP
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to O<sub>2</sub>; if not, diazepam 5-10 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: not necessary to prophylax with antibiotics unless contaminated water or hot-tub (*Pseudomonas*)
- must observe for at least 24 h as non-cardiogenic pulmonary edema may develop late

**Disposition**

- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (24 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

# Toxicology

## Alcohol Related Emergencies

- see also [Psychiatry](#), PS22

### Acute Intoxication

- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia → may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded rule out
  - head trauma/intracranial hemorrhage
  - associated depressants/street drugs, toxic alcohols
    - ♦ may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
    - ♦ precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

### Withdrawal

- beware of withdrawal signs (see Table 26)
- treatment:
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1hr until calm
    - ♦ frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 100 mg IM/IV then 50-100 mg/d
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with delirium tremens (DT), or multiple seizures

**Table 26. Alcohol Withdrawal Signs**

Time Since Last Drink	Syndrome	Description
6-8 h	Mild withdrawal	Generalized tremor, anxiety, agitation, but no delirium Autonomic hyperactivity (sinus tachycardia), insomnia, nausea, vomiting
1-2 d	Alcoholic hallucinations	Visual (most common), auditory and tactile hallucinations Vitals often normal
8 h-2 d	Withdrawal seizures	Typically brief generalized tonic-clonic seizures May have several within a few hours CT head if focal seizures have occurred
3-5 d	Delirium tremens (DT)	5% of untreated withdrawal patients Severely confused state, fluctuating levels of consciousness Agitation, insomnia, hallucinations/delusions, tremor Tachycardia, hyperpyrexia, diaphoresis High mortality rate

### Cardiovascular Complications

- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
  - atrial fibrillation (most common), atrial flutter, SVT, VT (especially Torsades if hypomagnesemic/hypokalemic)

### Metabolic Abnormalities

- alcoholic ketoacidosis
  - anion gap (AG) metabolic acidosis, urine ketones, low glucose and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with nausea and vomiting
  - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
  - generally resolves in 12-24 h
- other alcohols
  - ethylene glycol → CNS, CVS, renal findings
  - methanol
    - ♦ early: lethargy, confusion
    - ♦ late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)

Alcohol levels correlate poorly with intoxication.

Alcohol intoxication may invalidate informed consent.

### CIWA Withdrawal Symptoms

- Nausea and vomiting
- Tremor
- Paroxysmal sweats
- Anxiety
- Agitation
- Visual disturbances
- Tactile disturbances
- Auditory disturbances
- Headache
- Disorientation

10 symptoms each scored out of 7 except orientation is out of 4.

### Common Deficiencies

- Thiamine
- Niacin
- Folate
- Glycogen
- Magnesium
- Potassium

- EtOH co-ingestion is protective
- treatment
  - ♦ urgent hemodialysis required
  - ♦ fomepizole 15 mg/kg IV bolus OR EtOH 10% IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
  - ♦ consider folic acid for methanol and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

### Gastrointestinal Abnormalities

- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: *E. coli*, *Klebsiella*, *Streptococcus*)
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy

### Disposition

- before patient leaves ED ensure:
  - stable vital signs, can walk unassisted, fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

## Approach to the Overdose Patient

### History

- age, weight, underlying medical problems, medications
- substance and how much
- time since exposure determines prognosis and need for decontamination, symptoms since
- route
- intention, suicidality

### Physical Examination

- focus on: ABCs, LOC/GCS, vitals, pupils

#### Principles of Toxicology

4 principles to consider with all ingestions:

- Resuscitation (ABCs)
- Screening (toxidrome? clinical clues?)
- Decrease absorption of drug
- Increase elimination of drug

#### Suspect Overdose when:

- Altered level of consciousness/coma
- Young patient with life-threatening dysrhythmia
- Trauma patient
- Bizarre or puzzling clinical presentation

## ABCs of Toxicology

- basic axiom of care is symptomatic and supportive treatment
  - address underlying problem only once patient is stable
  - A Airway (consider stabilizing the C-spine)
  - B Breathing
  - C Circulation
  - D1 Drugs
    - ACLS as necessary to resuscitate the patient
    - universal antidotes
  - D2 Draw bloods
  - D3 Decontamination (decrease absorption)
  - E Expose (look for specific toxidromes)/Examine the patient
  - F Full vitals, ECG monitor, Foley, x-rays
  - G Give specific antidotes and treatments
- Go back and reassess  
Call poison information centre  
Obtain corroborative history from family, bystanders

## D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

### Dextrose (glucose)

- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W
- children: 0.25 g/kg (2-4 mL/kg) IV of D25W

### Oxygen

- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO<sub>2</sub> retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

### Naloxone (central $\mu$ -receptor competitive antagonist, shorter $t_{1/2}$ than naltrexone)

- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - ♦ 2 mg initial bolus IV/IM/SL/SC or via ETT (ETT dose = 2-2.5x IV dose)
    - ♦ if no response after 2-3 min, increase dose by 2 mg increments until a response or to max 10 mg
    - ♦ known chronic user, suspicious history, or evidence of track marks, give 0.01 mg/kg
  - child
    - ♦ 0.01 mg/kg initial bolus IV/IO/ETT
    - ♦ 0.1 mg/kg if no response and opioid still suspected to max of 10 mg
- maintenance dose
  - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
  - ♦ hourly infusion rate at 2/3 of initial dose that produced patient arousal

### Thiamine (Vitamin B1)

- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

#### Universal Antidotes

##### DON'T

- Dextrose
- Oxygen
- Naloxone
- Thiamine (must give BEFORE dextrose)

#### Populations at Risk for Thiamine Deficiency

- Alcoholics
- Anorexics
- Hyperemesis of pregnancy
- Malnutrition states

Administration of naloxone can cause opioid withdrawal in chronic users.

**Minor** withdrawal may present as lacrimation, rhinorrhea, diaphoresis, yawning, piloerection, HTN, and tachycardia.

**Severe** withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps.

## D2 – Draw Bloods

- essential tests (see Table 28)
  - CBC, electrolytes, BUN/creatinine, glucose, INR/PTT, osmolality
  - ABGs, measure O<sub>2</sub> sat
  - acetylsalicylic acid (ASA), acetaminophen, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen
  - Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical presentation

### Serum Drug Levels

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only)

Table 27. Toxic Gaps (see also [Nephrology, NP14](#))

<b>METABOLIC ACIDOSIS</b>	
<b>Increased AG:</b> "MUDPILES CAT" (* = toxic)	<b>Increased POG:</b> "MAE DIE" (if it ends in "-ol", it will likely increase the POG)
Methanol*	Methanol
Uremia	Acetone
Diabetic ketoacidosis/Starvation ketoacidosis	Ethanol
Phenformin*/Paraldehyde*	Diuretics (glycerol, mannitol, sorbitol)
Isoniazid, Iron, Ibuprofen	Isopropanol
Lactate (anything that causes seizures or shock)	Ethylene glycol
Ethylene glycol*	
Salicylates*	
Cyanide, carbon monoxide*	Note: normal osmolar gap does not rule out toxic alcohol; only an elevated gap is helpful
Alcoholic Ketoacidosis	
Toluene, theophylline*	
<b>Decreased AG</b>	<b>Increased O<sub>2</sub> saturation gap</b>
Electrolyte imbalance (increased Na <sup>+</sup> /K <sup>+</sup> /Mg <sup>2+</sup> )	Carboxyhemoglobin
Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L decrease in the AG)	Methemoglobin
Lithium, bromine elevation	Sulfmethemoglobin
Paraproteins (multiple myeloma)	
<b>Normal AG</b>	
High K <sup>+</sup> : pyelonephritis, obstructive nephropathy, renal tubular acidosis (RTA), IV, TPN	
Low K <sup>+</sup> : small bowel losses, acetazolamide, Renal Tubular Acidosis I, II	

**Plasma Osmolar Gap (POG)**  
 = (2 Na<sup>+</sup> + glucose + urea) – plasma osmolarity  
 "2 salts and a sugar BUN" – plasma osmolarity  
 Normal POG <10 mOsm/kg

**Anion Gap (AG)**  
 = Na<sup>+</sup> – Cl<sup>-</sup> – HCO<sub>3</sub><sup>-</sup>  
 Normal AG ≤12 mM/L

Table 28. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning

Test	Finding	Selected Causes
<b>ABG</b>	Hypoventilation (↑ pCO <sub>2</sub> ) Hyperventilation (↓ pCO <sub>2</sub> )	CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) Salicylates, CO, other asphyxiants
<b>Electrolytes</b>	↑ AGMA Hyperkalemia Hypokalemia	"MUDPILES CAT": see "Metabolic Acidosis", ER50 Digitalis glycosides, fluoride, potassium Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin
<b>Glucose</b>	Hypoglycemia	Oral hypoglycemia agents, insulin, EtOH, ASA
<b>Osmolality and Osmolar Gap</b>	Elevated osmolar gap	"MAE DIE": see "Toxic Gaps", above
<b>ECG</b>	Wide QRS complex Prolonged QT interval Atrioventricular block	TCAs, quinidine, other class Ia and Ic antidysrhythmic agents Quinidine and related antidysrhythmics, terfenadine, astemizole, antipsychotics Ca <sup>2+</sup> antagonists, digitalis glycosides, phenylpropanolamine
<b>Abdominal X-Ray</b>	Radiopaque pills or objects	"CHIPES": Calcium, Chloral hydrate, CCl <sub>4</sub> , Heavy metals, Iron, Potassium, Enteric coated Salicylates, and some foreign bodies
<b>Serum Acetaminophen</b>	Elevated level (>140 mg/L or 1000 μmol/L 4 h after ingestion)	May be only sign of acetaminophen poisoning

## D3 – Decontamination and Enhanced Elimination

### Ocular Decontamination

- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

### Dermal Decontamination (wear protective gear)

- remove clothing, brush off toxic agents, irrigate all external surfaces

### Gastrointestinal Decontamination

- single dose activated charcoal (SDAC) (see Table 31 for drug toxidromes that are treated with charcoal)
  - adsorption of drug/toxin to AC prevents availability
  - contraindications: caustics, SBO, perforation
  - dose: 10 g/g drug ingested or 1g/kg body weight
  - odourless, tasteless, prepared as slurry with H<sub>2</sub>O
- whole bowel irrigation
  - 500 mL/h (child) to 2000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
  - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated

**Substances NOT Adsorbed by Activated Charcoal**

- Lithium
- Iron
- Alcohols
- Lead
- Caustics

- indications
  - ♦ awake, alert, can be nursed upright OR intubated and airway protected
  - ♦ delayed release product
  - ♦ drug/toxin not bound to charcoal
  - ♦ drug packages (if any evidence of breakage → emergency surgery)
  - ♦ recent toxin ingestion
- contraindications
  - ♦ evidence of ileus, perforation, or obstruction
- surgical removal in extreme cases
  - indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
- no evidence for the routine use of cathartics (i.e. ipecac)

### Urine Alkalinization

- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

### Multidose Activated Charcoal (MDAC)

- may be used for: carbamazepine, phenobarbital, quinine, theophylline
- for toxins which undergo enterohepatic recirculation
- removes drug that has already been absorbed by drawing it back into GI tract
- various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic

### Hemodialysis

- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution ( $V_d$ ) or rapid plasma equilibration
  - removal of toxin will cause clinical improvement
  - advantage is shown over other modes of therapy
  - predicted that drug or metabolite will have toxic effects
  - impairment of normal routes of elimination (cardiac, renal, or hepatic)
  - clinical deterioration despite maximal medical support
- useful for the following toxins:
  - methanol
  - ethylene glycol
  - salicylates
  - lithium
  - phenobarbital
  - chloral hydrate (→ trichloroethanol)
- others include theophylline, carbamazepine, valproate, methotrexate

#### Position Paper Update: Ipecac Syrup for Gastrointestinal Decontamination

*Clin Toxicol* 2013;51:134-139

**Study:** Systematic review of 12 new studies (2003-2011) and summary of older studies (animal studies, volunteer studies, marker studies, case reports).

**Conclusions:** There is debate in the literature as to whether or not the use of ipecac should be completely abandoned, or whether it may remain useful in certain special circumstances. Concerns regarding the use of ipecac include the variability of its effects depending on elapsed time of administration and its interference with other treatments such as activated charcoal. Furthermore, ipecac use has a number of side effects such as diarrhea, drowsiness and prolonged vomiting, as well as some rare side effects which may contribute to death. Despite these, ipecac has a high margin of safety.

While routine administration of ipecac is not appropriate, it may be beneficial in certain circumstances. For example, its use may be considered when there is a substantial risk of serious toxicity, there are no contraindications (such as high risk of aspiration), no alternative treatment option exists (or when the administration of ipecac will have no effect on the alternative treatment option) and there can be timely delivery of ipecac (<90 min).

## E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, “tongue biting”, etc.), infection (meningismus), chronic alcohol/drug abuse (track marks, nasal septum erosion)
- mental status

**Table 29. Specific Toxicities**

Toxidrome	Overdose Signs and Symptoms	Examples of Drugs	
Anticholinergics	Hyperthermia	“Hot as a hare”	Antidepressants (e.g. TCAs)
	Dilated pupils	“Blind as a bat”	Cyclobenzaprine (Flexeril®)
	Dry skin	“Dry as a bone”	Carbamazepine
	Vasodilation	“Red as a beet”	Antihistamines (e.g. diphenhydramine)
	Agitation/hallucinations	“Mad as a hatter”	Antiparkinsonians
	Ileus	“The bowel and bladder	Antipsychotics
	Urinary retention	lose their tone and the	Antispasmodics
	Tachycardia	heart goes on alone”	Belladonna alkaloids (e.g. atropine)
Cholinergics	“DUMBELS”		Natural plants: mushrooms, trumpet flower
	Diaphoresis, Diarrhea, Decreased blood pressure		Anticholinesterases: physostigmine,
	Urination		Insecticides (organophosphates, carbamates)
	Miosis		Nerve gases
	Bronchospasm, Bronchorrhea, Bradycardia		
	Emesis, Excitation of skeletal muscle		
	Lacrimation		
	Salivation, Seizures		

**Table 29. Specific Toxidromes** (continued)

Toxidrome	Overdose Signs and Symptoms	Examples of Drugs
<b>Extrapyramidal</b>	Dysphonia, dysphagia Rigidity and tremor Motor restlessness, crawling sensation (akathisia) Constant movements (dyskinesia) Dystonia (muscle spasms, laryngospasm, trismus, oculogyric crisis, torticollis)	Major tranquilizers Antipsychotics
<b>Hemoglobin Derangements</b>	Increased respiratory rate Decreased level of consciousness Seizures Cyanosis unresponsive to O <sub>2</sub> Lactic acidosis	Carbon monoxide poisoning (carboxyhemoglobin) Drug ingestion (methemoglobin, sulfmethemoglobin)
<b>Narcotic Opioids, Sedative/Hypnotics, EtOH</b>	Hypothermia Hypotension Respiratory depression Dilated or constricted pupils (pinpoint in opioid OD) CNS depression	EtOH Benzodiazepines Opioids (morphine, heroin, fentanyl, etc.) Barbiturates Gamma hydroxybutyrate
<b>Sympathomimetics</b>	Increased temperature CNS excitation (including seizures) Tachycardia, hypertension Nausea and vomiting Diaphoresis Dilated pupils	Amphetamines, caffeine, cocaine, LSD, phencyclidine Ephedrine and other decongestants Thyroid hormone Sedative or EtOH withdrawal
<b>Serotonin Syndrome</b>	Mental status changes, autonomic hyperactivity, neuromuscular abnormalities, hyperthermia, diarrhea, HTN	MAOI, TCA, SSRI, opiate analgesics Cough medicine, weight reduction medications

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

## F – Full Vitals, ECG Monitor, Foley, X-rays

## G – Give Specific Antidotes and Treatments

### Urine Alkalinization Treatment for ASA Overdose

- urine pH >7.5
- fluid resuscitate first, then 3 amps NaHCO<sub>3</sub>/litre of D5W @ 1.5 x maintenance
- add 20-40 mEq KCl/litre if patient is able to urinate

**Table 30. Protocol for Warfarin Overdose**

INR	Management: Consider Prothrombin Complex Concentrate (PCC) (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding or a plan for the patient to undergo a surgical procedure within the next 6 h
<5.0	Cessation of warfarin administration, observation, serial INR/PT
5.1–9.0	If no risk factors for bleeding, hold warfarin x 1-2 d and reduce maintenance dose OR Vitamin K 1-2 mg PO if patient at increased risk of bleeding
9.1–20.0	Hold warfarin, vitamin K 2-4 mg PO, serial INR/PT, additional vitamin K if necessary
>20.0	Hold warfarin, vitamin K 10 mg IV over 10 min, increase vitamin K dosing (q4h) if needed

**Table 31. Specific Antidotes and Treatments for Common Toxins – call local poison information centre for specific doses and treatment recommendations**

Toxin	Treatment	Considerations
<b>Acetaminophen</b>	Decontaminate (SDAC) N-acetylcysteine	Often clinically silent; evidence of liver/renal damage delayed > 24 h Toxic dose > 200 mg/kg (> 7.5 g adult) Monitor drug level 4 h post-ingestion; also liver enzymes, INR, PTT, BUN, Cr Hypoglycemia, metabolic acidosis, encephalopathy → poor prognosis
<b>Acute Dystonic Reaction</b>	Benzotropine: 1-2 mg IM/IV then 2 mg PO x 3 d OR Diphenhydramine 1-2 mg/kg IV, then 25 mg PO qid x 3 d	Benzotropine (Cogentin®) has euphoric effect and potential for abuse
<b>Anticholinergics</b>	Decontaminate (SDAC) Supportive care	Special antidotes available. Consult Poison Information Centre (PIC)

**Table 31. Specific Antidotes and Treatments for Common Toxins – (continued)**  
**call local poison information centre for specific doses and treatment recommendations**

Toxin	Treatment	Considerations
<b>ASA</b>	Decontaminate (SDAC) Alkalinize urine; want urine pH >7.5	Monitor serum pH and drug levels closely Monitor K <sup>+</sup> level; may require supplement for urine alkalinization Hemodialysis may be needed if intractable metabolic acidosis, very high levels, or end-organ damage (i.e. unable to diurese)
<b>Benzodiazepines</b>	Decontaminate (SDAC) Flumazenil Supportive care	
<b>β-blockers</b>	Decontaminate (SDAC) Consider high dose insulin euglycemia therapy (HDIE) Some dialyzable, some use intralipids	Consult PIC
<b>Calcium Channel Blockers</b>	Decontaminate (SDAC) CaCl <sub>2</sub> 1-4 g of 10% sol'n IV if hypotensive Other: HDIE inotropes or intralipids	Order ECG, electrolytes (especially Ca <sup>2+</sup> , Mg <sup>2+</sup> , Na <sup>+</sup> , K <sup>+</sup> )
<b>Cocaine</b>	Decontaminate (SDAC) if oral Aggressive supportive care	β-blockers are contraindicated in acute cocaine toxicity Intralipid for life-threatening symptoms
<b>CO Poisoning</b>	See ER46 Supportive care 100% O <sub>2</sub>	
<b>Cyanide</b>	Hydroxocobalamin	
<b>Digoxin</b>	Decontaminate (SDAC) Digoxin-specific Ab fragments 10-20 vials IV if acute; 3-6 if chronic 1 vial (40 mg) neutralizes 0.5 mg of toxin	Use for life-threatening dysrhythmias unresponsive to conventional therapy, 6 h serum digoxin >12 nmol/L, initial K <sup>+</sup> >5 mM, ingestion >10 mg (adult)/>4 mg (child) Common dysrhythmias include VFib, VTach, and conduction blocks
<b>Ethanol</b>	Thiamine 100 mg IM/IV Manage airway and circulatory support	Hypoglycemia very common in children Mouthwash = 70% EtOH; perfumes and colognes = 40-60% EtOH Order serum EtOH level and glucose level; treat glucose level appropriately
<b>Ethylene Glycol/Methanol</b>	Fomepizole (4-methylpyrazole) 15 mg/kg IV load over 30 min, then 10 mg/kg q12h OR Ethanol (10%) 10 mL/kg over 30 min, then 1.5 mL/h	CBC, electrolytes, glucose, ethanol level Consider hemodialysis
<b>Heparin</b>	Protamine sulfate 25-50 mg IV	For unfractionated heparin overdose only
<b>Insulin IM/SC/Oral Hypoglycemic</b>	Glucose IV/PO/NG tube Glucagon: 1-2 mg IM (if no access to glucose)	Glyburide carries highest risk of hypoglycemia among oral agents Consider octreotide for oral hypoglycemics (50-100 µg SC q6h) in these cases; consult local PIC
<b>MDMA</b>	Decontaminate (SDAC), supportive care	Monitor CK; treat rhabdomyolysis with high flow fluids: aggressive external cooling for hyperthermia
<b>Opioids</b>	See Universal antidotes	
<b>TCAs</b>	Decontaminate (SDAC) Aggressive supportive care NaHCO <sub>3</sub> bolus for wide QRS/seizures	Flumazenil antidote contraindicated in combined TCA and benzodiazepine overdose Also consider cardiac and hypotension support, seizure control Intralipid therapy (consult local PIC)

## Disposition from the Emergency Department

- methanol, ethylene glycol
  - delayed onset, admit and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored (ICU) bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of OD warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA must have at least 2 levels going down before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h

### Psychiatric Consultation

- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed

# Psychiatric Emergencies

## Approach to Common Psychiatric Presentations

- see also [Psychiatry](#), PS2
- before seeing patient, ensure your own safety; have security/police available if necessary

### History

- safety
  - assess suicidality: suicidal ideation (SI), intent, plan, lethal means, past attempts
  - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, history of violence
  - driving and children
  - command hallucinations
- identify current stressors and coping strategies
- mood symptoms: manic, depressive
- anxiety: panic attacks, generalized anxiety, phobias, OCD, PTSD
- psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
- substance use history: most recent use, amount, previous withdrawal reactions
- past psychiatric history, medications, adherence with medications
- medical history: obtain collateral if available

### Physical

- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
- mental status exam: general appearance, behavior, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

### Investigations

- investigations vary with: age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum creatinine, BUN, osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated

#### Key Functions of Emergency Psychiatric Assessment

- Is the patient medically stable?
- Rule out medical cause
- Is psychiatric consult needed?
- Are there safety issues (SI, HI)?
- Is patient certifiable? (must demonstrate risk [present/past test] and apparent mental illness [future test])

#### Psychiatric review of systems for all patients with psychiatric presentations

##### MOAPS

Mood  
Organic  
Anxiety  
Psychosis  
Safety

## Acute Psychosis

### Differential Diagnosis

- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)

### Management

- violence prevention
  - remain calm, empathic and reassuring
  - ensure safety of staff and patients, have extra staff and/or security on hand
  - patients demonstrating escalating agitation or overt violent behavior may require physical restraint and/or chemical tranquilization (see *Violent Patient*, ER56)
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  - benzodiazepines: lorazepam 2 mg PO, IM or SL
  - antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult

## Suicidal Patient

### Epidemiology

- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr

### Management

- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts
- admit if there is evidence of intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the emergency department
- psychiatry or crisis team consult

#### High Risk Patients

##### SAD PERSONS

Sex = male  
Age >45 yr old  
Depression  
Previous attempts  
Ethanol use  
Rational thinking loss  
Suicide in family  
Organized plan  
No spouse, no support system  
Serious illness

## Violent Patient

### Differential Diagnosis

- rule out lethal organic cause (e.g. EtOH, drugs, and head injuries)

### Prevention

- be aware and look for prodromal signs of violence: anxiety, restlessness, defensiveness, verbal attacks
- try to de-escalate the situation: address the patient's anger, empathize

### Restraints

- pharmacological
  - often necessary – may mask clinical findings and impair exam
  - haloperidol 5-10 mg IM (be prepared for dystonic reactions, especially with multiple doses of neuroleptics over a short period) + lorazepam 2 mg IM/IV
  - look for signs of anticholinergic overdose first (see Table 29)
  - benzodiazepines best option if suspected substance-induced violence
- physical
  - present option to patient in firm but non-hostile manner
  - sufficient people to carry it out safely
  - restrain supine or on side; preferably 4-point restraints, never less than 2-points (opposite arm and leg)
  - suction and airway support available in case of vomiting
  - once restrained, search person/clothing for drugs and weapons

## Common Pediatric ER Presentations

### Modified Glasgow Coma Score

Table 32. Modified GCS

Modified GCS for Infants		
Eye Opening	Verbal Response	Motor Response
4 – spontaneously	5 – coos, babbles	6 – normal, spontaneous movement
3 – to speech	4 – irritable cry	5 – withdraws to touch
2 – to pain	3 – cries to pain	4 – withdraws to pain
1 – no response	2 – moans to pain	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response
Modified GCS for Children <4 years		
Eye Opening	Verbal Response	Motor Response
4 – spontaneously	5 – oriented, social, speaks, interacts	6 – normal, spontaneous movement
3 – to speech	4 – confused speech, disoriented, consolable	5 – localizes pain
2 – to pain	3 – inappropriate words, not consolable/aware	4 – withdraws to pain
1 – no response	2 – incomprehensible, agitated, restless, not aware	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

Any trauma or suspected trauma patient <1 yr of age with a large, boggy scalp hematoma requires ultrasound or CT.

## Respiratory Distress

- see also [Pediatrics](#), P92

### History and Physical Examination

- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see [Pediatrics](#) Table 1, P3 for age specific vital signs
- pulsus paradoxus
- wheezing, grunting, vomiting

**Table 33. Stridorous Upper Airway Diseases: Diagnosis**

Feature	Croup	Bacterial Tracheitis	Epiglottitis <sup>1</sup>
Age Range (yr)	0.5-4	5-10	2-8
Prodrome	Days	Hours to days	Minutes to hours
Temperature	Low grade	High	High
Radiography	Steeple sign	Exudates in trachea	Thumb sign
Etiology	Parainfluenza	<i>S. aureus</i> /GAS	<i>H. influenzae</i> type b
Barky Cough	Yes	Yes	No
Drooling	Yes	No	Yes
Appear Toxic	No	Yes	Yes
Intubation/ICU	No	Yes	Yes
Antibiotics	No	Yes	Yes
NOTE:	Oral exam	Oral exam	No oral exam, consult ENT!

<sup>1</sup>Now rare with Hib vaccine in common use

### Management

- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - humidified O<sub>2</sub> should not be given (no evidence for efficacy)
  - racemic epinephrine q1h x 3 doses, observe for 'rebound effects' nebulized 1:1000 epi (racemic has limited availability)
  - dexamethasone x 1 dose
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
- bacterial tracheitis
  - start croup therapy, but may have poor response
  - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
  - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia, ENT call – intubate
  - then IV fluids, antibiotics, blood cultures
- asthma
  - supplemental O<sub>2</sub> if saturation <90% or PaO<sub>2</sub> <60%
  - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg by masks q20min x 3
  - add 250-500 µg ipratropium (Atrovent®) to first 3 doses salbutamol
  - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.3 mg/kg)
  - if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO<sub>4</sub>
  - IV β<sub>2</sub>-agonists if critically ill and not responding to above

#### In Pediatric Respiratory Distress, Must also Rule Out:

- Anaphylaxis
- Foreign body
- Pneumonia
- Bronchiolitis

#### Admission Criteria for Croup

- Stridor at rest or significant respiratory distress
- Relapse after 2 doses of epinephrine or incomplete response
- Co-morbid respiratory or underlying condition

#### Admission Criteria for Asthma

- Respiratory distress 6 h after steroids
- Ventolin required >q3h
- Need for supplemental oxygen
- Consider if previous ICU admission
- Significant fatigue or lethargy

## Febrile Infant and Febrile Seizures

### FEBRILE INFANT

- see also [Pediatrics](#), P54
- for fever  $>38^{\circ}\text{C}$  without obvious focus
  - $<28$  d
    - ♦ admit
    - ♦ full septic work up (CBC and differential, blood C&S, urine C&S, LP  $\pm$  stool C&S, CXR if indicated)
    - ♦ treat empirically with broad spectrum IV antibiotics
  - 28-90 d
    - ♦ as above unless infant meets Rochester criteria (see sidebar), investigate as indicated by history and physical
  - $>90$  d
    - ♦ toxic: admit, treat, full septic workup
    - ♦ non-toxic and no focus: investigate as indicated by history and physical

### FEBRILE SEIZURES

- see also [Pediatrics](#), P87

#### Etiology

- children aged 6 mo to 6 yr with fever or history of recent fever
- simple vs. complex febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well looking after seizure

#### Investigations and Management

- if it is a febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
- $\pm$  EEG (especially if first seizure), head U/S (if fontanelle open)

Table 34. Simple vs. Complex Febrile Seizures

Characteristic	Simple	Complex
Duration	$<15$ min	$>15$ min
Type of Seizure	Generalized	Focal features
Frequency	1 in 24 h	$>1$ in 24 h

#### Rochester Criteria for Febrile Infants Age 28-90 Days Old

- Non-toxic looking
- Previously well ( $>37$  wk GA, home with mother, no hyperbilirubinemia, no prior antibiotics or hospitalizations, no chronic/underlying illness)
- No skin, soft tissue, bone, joint, or ear infection on physical exam
- WBC 5000-15,000, bands  $<1500$ , urine  $<10$  WBC/HPF, stool  $<5$  WBC/HPF

## Abdominal Pain

- see also [Pediatrics](#), P38

### History

- nature of pain, associated fever
- associated GI, GU symptoms
- anorexia, decreased fluid intake

### Physical Examination

- HEENT, respiratory, abdominal exam including DRE, testicular/genital exam

Table 35. Differential Diagnosis of Abdominal Pain in Infants/Children/Adolescents

Medical	Surgical
Colic	Malrotation with volvulus
UTI	Hirschsprung's disease
Constipation	Necrotizing enterocolitis
Gastroenteritis	Incarcerated hernia
Sepsis	Intussusception
HSP (Henoch Schonlein purpura)	Duodenal atresia
Inflammatory Bowel Disease	Appendicitis
HUS (Hemolytic Uremic Syndrome)	Cholecystitis
Pneumonia	Pancreatitis
Strep Throat	Testicular torsion
SCD crisis	Ectopic pregnancy
DKA	Trauma
Functional	Pyloric stenosis

\*Remember to keep an index of suspicion for child abuse

#### Red Flags for Abdominal Pain

- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis

## Common Infections

- see also [Pediatrics](#), P58

**Table 36. Antibiotic Treatment of Pediatric Bacterial Infections**

Infection	Pathogens	Treatment
<b>MENINGITIS SEPSIS</b>		
Neonatal	GBS, <i>E.coli</i> , <i>Listeria</i> , Gram-negative bacilli	ampicillin + cefotaxime
1-3 mo	Same pathogens as above and below	ampicillin + cefotaxime + vancomycin
>3 mo	<i>S. pneumoniae</i> , <i>H. influenzae</i> type b (>5 yr), meningococcus	ceftriaxone + vancomycin
<b>OTITIS MEDIA</b>		
1st line	<i>S. pneumoniae</i> , <i>H. influenzae</i> type b, <i>M. Catarrhalis</i>	amoxicillin 80-90 mg/kg per day
2nd line		clarithromycin 15 mg/kg/d bid (for penicillin allergy)
Treatment failure		90 mg/kg/d amoxicillin and 6.4 mg/kg/d clavulanate divided into bid dosage
<b>STREP PHARYNGITIS</b>		
	Group A $\beta$ -hemolytic <i>Streptococcus</i>	penicillin/amoxicillin or erythromycin (penicillin allergy)
<b>UTI</b>		
	<i>E. coli</i> , <i>Proteus</i> , <i>H. influenzae</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> , <i>Enterococcus</i> , GBS	Oral: cephalexin (older children) IV: ampicillin and aminoglycoside
<b>PNEUMONIA</b>		
1-3 mo	Viral, <i>S. pneumoniae</i> , <i>C. trachomatis</i> , <i>B. pertussis</i> , <i>S. aureus</i> , <i>H. influenzae</i>	cefuroxime $\pm$ macrolide (erythromycin) OR ampicillin $\pm$ macrolide
3 mo-5 yr	Viral, <i>S. pneumoniae</i> , <i>S. aureus</i> , <i>H. influenzae</i> , <i>Mycoplasma pneumoniae</i>	ampicillin/amoxicillin or cefuroxime
>5 yr	As above	ampicillin/amoxicillin + macrolide or cefuroxime + macrolide

## Child Abuse and Neglect

- see also [Pediatrics](#), P14
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - head injuries: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken Baby Syndrome: diffuse brain injury, subdural/subarachnoid hemorrhage, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures age <1 yr of age, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - genitourinary/gastrointestinal injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

### Presentation of Neglect

- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

## Procedural Sedation

- procedural sedation: the technique of sedative or dissociative agent administration with or without analgesics to induce a state that allows a patient to tolerate an unpleasant or painful procedure while maintaining all protective cardiorespiratory functions (i.e. a depressed level of consciousness without loss of a patient's protective airway reflexes)
  - must weigh degree of pain and expected relief versus risk/complications of sedation and procedure

### Requirements for Safe Procedural Sedation in the Emergency Department

- airway suitable for safe intubation and ventilation
- appropriate equipment/personnel available
- intact and functioning cardiorespiratory and neurological system
- ideally, NPO for minimum 4-6 h
- anesthetic history and drug allergies, including manifestations
- appropriate IV access, monitoring (oxygen saturation, BP, HR, etc.)
- informed consent obtained

### Common Procedural Sedation Medications (titrate to effect)

- see *Common Medications*, below

#### Examples that may Require Sedation

- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- May also be required to reduce patient agitation if imaging is acutely required

## Common Medications

Table 37. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Acetaminophen	325-650 mg PO q4-6h prn	Pain control	Max 4 g daily
Activated charcoal	30-100 g PO in 250 mL H <sub>2</sub> O	Poisoning/overdose	
ASA	325-650 mg PO q4h max 4g/d stroke/MI risk: 81-325 mg PO OD 160 mg chewed	Pain control Cardiac prevention Acute Coronary Syndrome	
β-blockers (metoprolol)	5 mg slow IV q5min x 3 if no contraindications	Acute MI	
Diazepam	anxiety: 2-10 mg PO tid/qid alcohol withdrawal: 10-20 mg PO/IV q1h titrated to signs/symptoms	Anxiety Alcohol withdrawal	
Enoxaparin	1 mg/kg SC bid	Acute MI	
Epinephrine	anaphylaxis: 0.1-0.5 mg IM; can repeat q10-15min	Anaphylaxis	Max 1 mg/dose
Fentanyl	0.5-1.0 µg/kg IV	Procedural sedation	Very short acting narcotic (complication=apnea)
Flumazenil	0.3 mg IV bolus q5min x 3doses	Reversal of procedural sedation	Benzodiazepine antagonist NB don't use in chronic benzodiazepine user
Furosemide (Lasix®)	CHF: 40-80 mg IV HTN: 10-40 mg PO bid	CHF HTN	Monitor for electrolyte imbalances
Glucose	0.5-1.0 g/kg (1-2 mL/kg) IV of D50W	Hypoglycemia/DKA	
Haloperidol	2.5-5.0 mg PO/IM initial effective dose 6-20 mg/d	Psychosis	Monitor with Parkinson's; results in CNS depression
Ibuprofen	200-800 mg PO tid prn max 1200 mg/d	Mild to moderate acute pain Analgesia and anti-inflammatory properties	
Insulin	bolus 5-10 U (0.2 U/kg) then 5-10 U (0.1 U/kg) per hour	Hyperglycemia	Monitor blood glucose levels Consider K <sup>+</sup> replacement, also measure blood glucose levels before administration
Ipratropium bromide	2-3 puffs inhaled tid-qid, max 12 puffs/d	Asthma	Contraindicated with peanut/soy allergy Caution with narrow-angle glaucoma
Lidocaine with epi	max 7 mg/kg SC	Local anesthetic	Not to be used in fingers, nose, toes, penis, ears
Lidocaine w/o epi	max 5 mg/kg SC	Local anesthetic	
Lorazepam	anxiety: 0.5-2 mg PO/IM/IV q6-8h status epilepticus; 4 mg IV repeat up to q5min	Anxiety Status epilepticus	
Midazolam	50 µg/kg IV	Procedural sedation	Short acting benzodiazepine (complication=apnea when used with narcotic) Fentanyl and midazolam often used together for procedural sedation

**Table 37. Commonly Used Medications** (continued)

Drug	Dosing Schedule	Indications	Comments
Morphine	15-30 mg PO q8-12h 0.1-0.2 mg/kg max 15 mg IV q4h	Mild to moderate acute/chronic pain Prescribed in combination with NSAIDs or acetaminophen	GI and constipation side effects DO NOT CRUSH, CUT or CHEW
Naloxone	0.5-2 mg or 0.01-0.02 mg/kg initial bolus IV/IM/SL/SC or via ETT (2-2.5x IV dose), increase dose by 2 mg until response/max 10 mg	Comatose patient Opioid overdose Reversal in procedural sedation	
Nitroglycerin	acute angina: 0.3-0.6 mg SL q5min, OR 5 µg/min IV increasing by 5-20 µg/min q3-5min	Angina Acute MI	Not to be used with other anti-hypertensives Not in RV MI
Percocet 10/325®	1-2 tabs PO q6h prn	Moderate pain control	Oxycodone + acetaminophen Max 4 g acetaminophen daily
Phenytoin	Status epilepticus: see Table 14	Status epilepticus	Begin maintenance dose 12 h after loading dose Continuous ECG, BP monitoring mandatory
Polysporin®	Apply to affected area bid-tid	Superficial infections	
Propofol	0.25-1 mg/kg IV	Procedural sedation	Short acting Anesthetic/sedative (complication = apnea, decreased BP)
Salbutamol	2 puffs inhaled q4-6h (4 yr) max 12 puffs/d	Asthma	Caution with cardiac abnormalities
Thiamine	Wernicke's encephalopathy: 100 mg IV/IM initially then 50-100 mg IM/IV OD PO x 3d	To treat/prevent Wernicke's encephalopathy	Caution use in pregnancy
Tylenol #3®	1-2 tabs PO q4-6h prn	Pain control	Max 4 g acetaminophen daily

## Basic Anatomy Review

### Major Endocrine Organs

Figure 1. Endocrine system

## Dyslipidemias

### Definition

- metabolic disorders characterized by elevations of fasting plasma LDL-cholesterol, and/or triglycerides (TG), and/or low HDL-cholesterol

### Overview of Lipid Transport

- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apoproteins and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme co-factors, promote clearance of the particle by interacting with cellular receptors and stabilize the lipoprotein micelle

### GENERAL FUNCTION OF ORGANS

#### The Hypothalamic-Pituitary Axis

Information about cortical inputs, automatic function, environmental cues (light, temp) and peripheral hormonal feedback is synthesized at the coordinating centre of the endocrine system, the hypothalamus. The hypothalamus then sends signals to the pituitary to release hormones that affect the thyroid, adrenals, gonads, growth, milk production and water balance.

#### Anatomy ↔ Function

Hypothalamic hormones: small peptides, non-binding protein → rapid degradation  
High [ ] in pituitary-portal blood system  
Low [ ] in peripheral circulation  
Proximity of axis preserves the pulsatile output signals from the hypothalamic neurons.

#### Thyroid

Thyroid hormone is critical to 1) brain and somatic development in fetus and infants, 2) metabolic activity in adults, and 3) function of virtually every organ system.

#### Adrenal

Each gland, 6-8 g, has 1) a cortex with 3 layers that act like independent organs (zona glomerulosa → aldosterone, fasciculata → cortisol, reticularis → androgen and estrogen precursors), and 2) a medulla that acts like a sympathetic ganglion to store/synthesize adrenaline and noradrenaline.

#### Gonads

Bifunctional: sex steroid synthesis and gamete production.  
Sex steroids controls sexuality and affect metabolic and brain functions.

#### Parathyroid

Synthesize and secrete PTH, a principle regulator of ECF Ca<sup>2+</sup>, regulated by [Ca<sup>2+</sup>], [Mg<sup>2+</sup>], 1,25(OH)<sub>2</sub>D (active metabolite of vit. D), and phosphate.

#### Pancreas

Endocrine islet β-cells produce insulin: oppose glucose production (glycogenolysis, gluconeogenesis), increase glucose uptake into muscle and fat. Glucagon, epinephrine, cortisol, and GH are counter regulatory.

**Table 1. Lipoproteins**

Lipoprotein	Apolipoproteins	Function
<b>Exogenous pathway</b>		
Chylomicron	B-48, C, E, A-I, A-II, A-IV	• Transports dietary TG from gut to adipose tissue and muscle
<b>Endogenous Pathway</b>		
VLDL	B-100, C, E	• Transports hepatic synthesized TG from liver to adipose tissue and muscle
IDL	B-100, E	• Product of hydrolysis of TG in VLDL by lipoprotein lipase resulting in depletion of TG core • Enriched in cholesterol esters
LDL	B-100	• Formed by further removal of residual TG from IDL core by hepatic lipase resulting in greater enriched particles with cholesterol esters • Transports cholesterol from liver to peripheral tissues (gonads, adrenals)
HDL	A-I, A-II, C, E	• Transports cholesterol from peripheral tissues to liver • Acts as a reservoir for apolipoproteins

**Figure 2. Exogenous and endogenous biosynthetic lipid pathways**

## Hypercholesterolemia

### PRIMARY HYPERCHOLESTEROLEMIA

**Table 2. Primary Hypercholesterolemias**

Hypercholesterolemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Hypercholesterolemia	<ul style="list-style-type: none"> <li>1/500 in U.S. population</li> <li>Autosomal codominant with high penetrance</li> <li>More prevalent in French Canadian population</li> <li>Defect in the normal LDL receptor on cell membranes</li> </ul>	↑ LDL ↑ TC	<ul style="list-style-type: none"> <li>Tendinous xanthomatosis (achilles, patellar, and extensor tendons of hand)</li> <li>Arcus cornealis</li> <li>Xanthelasmata</li> <li>Heterozygotes: premature CAD, 50% risk of MI in men by age 30</li> <li>Homozygotes: manifest CAD and other vascular disease early in childhood and can be fatal (&lt;20 y) if untreated</li> </ul>	<ul style="list-style-type: none"> <li>Heterozygotes: improvement of LDL with HMG CoA reductase inhibitors, often in combination with niacin ezetimibe or bile acid sequestrants</li> <li>Homozygotes: partial control with portacaval shunt or LDL apheresis in conjunction with niacin; large dose atorvastatin is modestly effective</li> </ul>
Polygenic Hypercholesterolemia	<ul style="list-style-type: none"> <li>Most common</li> <li>Few mild inherited defects in cholesterol metabolism</li> </ul>	↑ TC ↑ LDL	<ul style="list-style-type: none"> <li>Asymptomatic until vascular disease develops</li> <li>No xanthomata</li> </ul>	<ul style="list-style-type: none"> <li>HMG CoA reductase inhibitors, ezetimibe, niacin, bile acid sequesterant</li> </ul>

## SECONDARY HYPERCHOLESTEROLEMIA

### Etiology

- endocrine: hypothyroidism
- renal: nephrotic syndrome
- immunologic: monoclonal gammopathy
- hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)
- nutritional: diet, anorexia nervosa
- drugs: cyclosporin, anabolic steroids, carbamazepine

## Hypertriglyceridemia (Elevated TG)

### PRIMARY HYPERTRIGLYCERIDEMIA

Table 3. Primary Hypertriglyceridemias

Hypertriglyceridemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Lipoprotein Lipase Deficiency	• Autosomal recessive deficiency of lipoprotein lipase or its cofactor	↑ TG ↑ Chylomicrons Moderate ↑ in VLDL	<ul style="list-style-type: none"> <li>• Hepatosplenomegaly</li> <li>• Splenic infarct</li> <li>• Anemia, granulocytopenia, thrombocytopenia 2° to hypersplenism</li> <li>• Pancreatitis</li> <li>• Lipemia retinalis</li> <li>• Eruptive xanthomata</li> </ul>	<ul style="list-style-type: none"> <li>• Decrease dietary fat intake to &lt;10% of total calories</li> <li>• Decrease dietary simple carbohydrates</li> <li>• Cook with medium chain fatty acids</li> <li>• Abstain from EtOH</li> </ul>
Familial Hypertriglyceridemia	• Several genetic defects resulting in ↑ hepatic VLDL synthesis or ↓ removal of VLDL	↑ TG ↑ VLDL	<ul style="list-style-type: none"> <li>• Possible premature CAD</li> <li>• Develop syndrome of obesity, hypertriglyceridemia, hyperinsulinemia and hyperuricemia in early adulthood</li> </ul>	<ul style="list-style-type: none"> <li>• Decrease dietary simple carbohydrates and fat intake</li> <li>• Abstain from EtOH</li> <li>• Fibrates or niacin</li> </ul>

**Hypertriglyceridemia and Pancreatitis**  
Serum triglyceride levels >10 mmol/L increases the risk of developing pancreatitis (even some reports of TG >5 mmol/L).

**Low HDL**  
Common causes:  

- Obesity
- Physical inactivity
- Cigarette smoking
- Metabolic syndrome, Type 2 Diabetes Mellitus

### SECONDARY HYPERTRIGLYCERIDEMIA

#### Etiology

- endocrine: obesity/metabolic syndrome, hypothyroidism (more for high LDL, not TG), acromegaly, Cushing's syndrome, diabetes mellitus
- renal: chronic renal failure, polyclonal and monoclonal hypergammaglobulinemia
- hepatic: chronic liver disease, hepatitis, glycogen storage disease
- drugs: alcohol, corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
- other: pregnancy

**Side-effects of Atypical Anti-psychotics**  
Increased risk of:  

- Dyslipidemia
- Hypertension
- Metabolic syndrome
- Hyperglycemia

## Combined Hyperlipidemia

Table 4. Primary Combined Hyperlipidemias

Hyperlipidemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Combined Hyperlipidemia	• Over-population of VLDL and associated ↑ LDL 2° to excess hepatic synthesis of apolipoprotein B • Autosomal dominant	↑ TC + TG ↑ VLDL ↑ LDL	<ul style="list-style-type: none"> <li>• Xanthelasma</li> <li>• CAD and other vascular disease</li> </ul>	<ul style="list-style-type: none"> <li>• Weight reduction</li> <li>• Decrease simple carbohydrates, fat, cholesterol, and EtOH in diet</li> <li>• HMG CoA reductase inhibitors (statins)</li> <li>• Niacin, fibrates, ezetimibe</li> </ul>
Dysbetalipoproteinemia	• Abnormal apolipoprotein E	↑ TC + TG ↑ VLDL ↑ IDL	<ul style="list-style-type: none"> <li>• Tuberos, eruptive, palmar xanthomata</li> <li>• Impaired glucose tolerance</li> <li>• CAD and PAD</li> </ul>	<ul style="list-style-type: none"> <li>• Weight reduction</li> <li>• Decrease fat, cholesterol, and EtOH in diet</li> <li>• HMG CoA reductase inhibitors</li> <li>• Niacin, fibrates</li> </ul>

## Dyslipidemia and the Risk for CAD

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with diabetes mellitus and in post-menopausal women
- treatment of hypertriglyceridemia has not been shown to reduce CAD risk

### Screening

- screen men over age 40, women over age 50 or post-menopausal
- if following risk factors present, screen at any age:
  - diabetes
  - cigarette smoking
  - hypertension (sBP >140, dBP >90)
  - obesity
  - family history of premature coronary artery disease
  - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  - evidence of atherosclerosis
  - rheumatoid arthritis, SLE, psoriasis
  - HIV infection on highly active antiretroviral therapy (HAART)
  - chronic kidney disease (estimated GFR <60 mL/min/1.73 m<sup>2</sup>)
  - erectile dysfunction
- screen children with a family history of hypercholesterolemia or chylomicronemia

### Factors Affecting Risk Assessment

- metabolic syndrome
- apolipoprotein B (apo B):
  - each atherogenic particle (VLDL, IDL, LDL and lipoprotein A) contains one molecule of apo B
  - serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
- C-reactive protein (hs-CRP) levels:
  - highly sensitive acute phase reactant
  - may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

#### Treatment Effect

Each 1.0 mmol/L decrease in LDL corresponds to 20-25% relative risk reduction in cardiovascular disease.

#### For Statin Follow-Up

- Liver enzymes and lipid profile: liver enzymes measured at the beginning of treatment then once after therapy initiated. Lipids (once stabilized) measured annually. Order both if patient complains of jaundice, RUQ pain, dark urine
- CK at baseline and if patient complains of myalgia
- D/C statin if CK >10x upper limit of normal or patient has persistent myalgia

## Treatment of Dyslipidemias

### Approach to Treatment

For clinical guidelines see Can J Cardiol 2012;29:151-167

- estimate 10-yr risk of CAD using Framingham model
- establish treatment targets according to level of risk (see Table 5)

**Table 5. Target Lipids by Risk Group**

Level of Risk	Definition (10-yr Risk of CAD)	Initiate Treatment if:	Primary Target LDL-C	Alternate
High	<ul style="list-style-type: none"> <li>• Risk ≥20%, or</li> <li>• Clinical atherosclerosis</li> <li>• Abdominal aortic aneurysm</li> <li>• Diabetes &gt;15 yr duration and age older than 30 yr</li> <li>• Diabetes with age older than 40 yr</li> <li>• Microvascular disease</li> <li>• High risk kidney disease</li> <li>• High risk hypertension</li> </ul>	Consider treatment in all patients	≤2 mmol/L (78 mg/dL) or ≥50% ↓ in LDL	apo B ≤0.80 g/L or non-HDL-C ≤2.6 mmol/L
Moderate	Risk 10-19%	<ul style="list-style-type: none"> <li>• LDL &gt;3.5 mmol/L (136.5 mg/dL)</li> <li>• For LDL-C &lt;3.5 consider if: apo B ≥1.2 g/L or non-HDL-C ≥4.3 mmol/L</li> </ul>	≤2 mmol/L (78 mg/dL) or ≥50% ↓ in LDL	apo B <0.80 g/L or non-HDL-C ≤2.6 mmol/L
Low	Risk <10%	<ul style="list-style-type: none"> <li>• LDL ≥5.0 mmol/L (195 mg/dL)</li> <li>• Familial hypercholesterolemia</li> </ul>	≥50% ↓ in LDL	

#### Intensive Lipid Lowering in CAD: TNT

NEJM 2005;352:1425-1435

**Study:** Multicentre, randomized, double-blinded trial with median follow-up of 4.9 yr.

**Patients:** 10,001 patients with CAD and LDL-C <3.4 mmol/L.

**Intervention:** 80 mg versus 10 mg atorvastatin daily.

**Main outcomes:** Death from CAD, MI, cardiac arrest, or stroke.

**Results:** A primary event occurred in 8.7% of the patients receiving intensive therapy, compared to 10.9% of patients receiving standard therapy (RR 0.78, p<0.001). There was no difference in overall mortality. Incidence of persistent transaminase elevations was higher in the intensive therapy group (1.2% versus 0.2%, p<0.001).

**Conclusion:** Intensive statin therapy is associated with lower rates of CAD events than standard therapy, but also a higher rate of transaminase elevation.

#### Simvastatin to Lower CAD Risk – The Heart Protection Study (HPS)

Lancet 2002;360:7-22

**Study:** Randomized, double-blind, placebo-controlled trial (median follow-up 5.0 yr).

**Patients:** 20,536 patients with coronary disease, other occlusive arterial disease or diabetes (aged 40-80 yr) who had a total cholesterol level of ≥3.5 mmol/L.

**Intervention:** Simvastatin 40 mg/d or placebo.

**Main Outcomes:** Mortality, fatal or non-fatal vascular events.

**Results:** The use of simvastatin significantly decreased total mortality (12.9 vs. 14.7, p=0.0003) and the first event rate of any cardiovascular event by 25% (p<0.0001).

**Conclusion:** Treatment with simvastatin improved survival and cardiovascular outcomes in high-risk CAD patients.

**Table 6. Treatment of Hypercholesterolemia and Hypertriglyceridemia**

Treatment of Hypercholesterolemia	Treatment of Hypertriglyceridemia
<ul style="list-style-type: none"> <li>• <b>Conservative:</b> 4-6 mo trial unless high risk group, in which case medical treatment should start immediately               <ul style="list-style-type: none"> <li>• Diet                   <ul style="list-style-type: none"> <li>• Decrease fat: &lt;30% calories</li> <li>• Decrease saturated fat: &lt;10% calories</li> <li>• Decrease cholesterol: &lt;200 mg/d</li> <li>• Increase fibre: &gt;30 g/d</li> </ul> </li> <li>• Decrease alcohol intake to ≤1-2 drinks/d</li> <li>• Smoking cessation</li> <li>• Aerobic exercise: ≥150 min/wk in bouts of ≥10 min</li> <li>• Weight loss: target body mass index (BMI) &lt;25</li> </ul> </li> <li>• <b>Medical</b> <ul style="list-style-type: none"> <li>• HMG-CoA reductase inhibitors, ezetimibe, bile acid sequestrants, niacin (see <i>Common Medications</i>, E52)</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>Conservative:</b> 4-6 mo trial               <ul style="list-style-type: none"> <li>• Diet                   <ul style="list-style-type: none"> <li>• Decrease fat and simple carbohydrates</li> <li>• Increase omega-3 polyunsaturated fatty acid</li> </ul> </li> <li>• Control blood sugars</li> <li>• Decrease alcohol intake to ≤1-2 drinks/d</li> <li>• Smoking cessation</li> <li>• Aerobic exercise: ≥150 min/wk in bouts of ≥10 min</li> <li>• Weight loss: target body mass index (BMI) &lt;25</li> </ul> </li> <li>• <b>Medical:</b> fibrates, niacin (see <i>Common Medications</i>, E52)               <ul style="list-style-type: none"> <li>• Indications:                   <ul style="list-style-type: none"> <li>• Failed conservative measures</li> <li>• TG &gt;10 mmol/L (885 mg/dL) to prevent pancreatitis</li> </ul> </li> <li>• Combined hyperlipidemia</li> </ul> </li> </ul>

# Disorders of Glucose Metabolism

## Overview of Glucose Regulation

### Glucose Related Emergencies

- DKA
- HHS
- Hypoglycemia

Figure 3. Antihyperglycemic agents

## Pre-Diabetes (Impaired Glucose Tolerance/ Impaired Fasting Glucose)

- 1-5% per yr go on to develop diabetes mellitus
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance
- increased risk of developing macrovascular complications
- lifestyle modifications decrease progression to DM by 58%

### Diagnostic Criteria

- impaired fasting glucose (IFG): fasting blood glucose (FBG) 6.1-6.9 mmol/L (110-125 mg/dL)
- impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 7.8-11.0 mmol/L (140-200 mg/dL)

## Diabetes Mellitus (DM)

### Definition

- syndrome of disordered metabolism and inappropriate hyperglycemia secondary to an absolute/relative deficiency of insulin, or a reduction in biological effectiveness of insulin, or both

### Diagnostic Criteria

- any one of the following is diagnostic:
  - presence of classic symptoms of DM (polyuria, polydipsia, polyphagia, weight loss, blurry vision, nocturia, ketonuria) PLUS random blood glucose (BG)  $\geq 11.1$  mmol/L (200 mg/dL)
  - on at least two separate occasions:
    - ♦ FPG  $\geq 7.0$  mmol/L (126 mg/dL) (fasting = no caloric intake for at least 8 h) OR
    - ♦ 2h 75 g OGTT  $\geq 11.1$  mmol/L (200 mg/dL) OR
    - ♦ random PG  $\geq 11.1$  mmol/L (200 mg/dL) OR
    - ♦ HbA1c  $\geq 6.5\%$

In the absence of symptomatic hyperglycemia, if a single laboratory test result is in the diabetes range, a repeat confirmatory laboratory test (FPG, A1c, 2hPG in a 75 g OGTT) must be done on another day.

## Etiology and Pathophysiology

**Table 7. Etiologic Classification of Diabetes Mellitus**

<b>I. Type 1 diabetes</b> (immune-mediated $\beta$ cell destruction, usually leading to absolute insulin deficiency)
<b>II. Type 2 diabetes</b> (ranges from predominantly insulin resistance with relative insulin deficiency to a predominantly insulin secretory defect with insulin resistance 2° to $\beta$ cell dysfunction)
<b>III. Other specific causes of diabetes:</b> <ul style="list-style-type: none"> <li>a. Genetic defects of <math>\beta</math> cell function (e.g. MODY – Maturity-Onset Diabetes of the Young) or insulin action</li> <li>b. Diseases of the exocrine pancreas: <ul style="list-style-type: none"> <li>• Pancreatitis, pancreatectomy, neoplasia, cystic fibrosis, hemochromatosis (“bronze diabetes”)</li> </ul> </li> <li>c. Endocrinopathies: <ul style="list-style-type: none"> <li>• Acromegaly, Cushing’s syndrome, glucagonoma, pheochromocytoma, hyperthyroidism</li> </ul> </li> <li>d. Drug-induced: <ul style="list-style-type: none"> <li>• Glucocorticoids, thyroid hormone, <math>\beta</math>-adrenergic agonists, thiazides, phenytoin, clozapine</li> </ul> </li> <li>e. Infections: <ul style="list-style-type: none"> <li>• Congenital rubella, CMV, coxsackie</li> </ul> </li> <li>f. Genetic syndromes associated with diabetes: <ul style="list-style-type: none"> <li>• Down’s syndrome, Klinefelter’s syndrome, Turner’s syndrome</li> </ul> </li> </ul>
<b>IV. Gestational Diabetes Mellitus</b> (see <a href="#">Obstetrics</a> , OB13)

**Table 8. Comparison of Type 1 and Type 2 Diabetes Mellitus**

	Type 1	Type 2
<b>Onset</b>	• Usually <30 yr of age	• Usually >40 yr of age • Increasing incidence in pediatric population 2° to obesity
<b>Epidemiology</b>	• More common in Caucasians • Less common in Asians, Hispanics, Aboriginals, and Blacks • Accounts for 5-10% of all DM	• More common in Blacks, Hispanics, Aboriginals, Asians • Accounts for >90% of all DM
<b>Etiology</b>	• Autoimmune	• Complex and multifactorial
<b>Genetics</b>	• Monozygotic twin concordance is 30-40% • Associated with HLA class II DR3 and DR4, with either allele present in up to 95% of Type 1 DM • Certain DQ alleles also confer a risk	• Greater heritability than Type 1 DM • Monozygotic twin concordance is 70-90% • Polygenic • Non-HLA associated
<b>Pathophysiology</b>	• Synergistic effects of genetic, immune, and environmental factors that cause $\beta$ cell destruction resulting in impaired insulin secretion • Autoimmune process is believed to be triggered by environmental factors (e.g. viruses, bovine milk protein, urea compounds) • Pancreatic cells are infiltrated with lymphocytes resulting in islet cell destruction • 80% of $\beta$ cell mass is destroyed before features of diabetes present	• Impaired insulin secretion, peripheral insulin resistance (likely due to receptor and post receptor abnormality), and excess hepatic glucose production
<b>Natural history</b>	<ul style="list-style-type: none"> <li>• After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin</li> <li>• Once these cells are destroyed, there is complete insulin deficiency</li> </ul>	<ul style="list-style-type: none"> <li>• Early on, glucose tolerance remains normal despite insulin resistance as <math>\beta</math> cells compensate with increased insulin production</li> <li>• As insulin resistance and compensatory hyperinsulinism continue, the <math>\beta</math> cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and diabetes</li> </ul>
<b>Circulating autoantibodies</b>	• Islet cell Ab present in up to 60-85% • Most common islet cell Ab is against glutamic acid decarboxylase (GAD) • Up to 60% have Ab against insulin	• <10%

### Three-year Efficacy of Complex Insulin Regimens in Type 2 Diabetes: 4T Trial *NEJM* 2009;361:1736-1747

**Study:** Randomized unblinded trial with 3 yr of follow-up.

**Population:** 708 patients with type 2 DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.

**Intervention:** Thrice-daily prandial insulin aspart, versus twice-daily biphasic insulin aspart, versus once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regime specific to each arm if there was persistent hyperglycemia.

**Primary Outcome:** 3-yr hemoglobin HbA1c.

**Results:** Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 8.5% basal regimens ( $p=0.04$ ). There were no significant differences in median HbA1c levels between all three arms from yr 1 to 3. A smaller proportion of patients reached HbA1c <6.5% or <7.0% in the biphasic arm. The basal arm had least weight gain and least weight circumference increase, but highest rate of secondary insulin requirement. The basal arm had fewest severe hypoglycemic events per patient yr, while the biphasic had the most serious adverse effects.

**Conclusion:** Basal insulin regime provides the best glycemic control over a 3-yr study; with better HbA1c control, fewer hypoglycemic events, and less weight gain.

### Blood Glucose Control in Type 2 DM – UKPDS 33 *Lancet* 1998;352:837-853

**Study:** Randomized controlled trial (mean follow-up 10 yr).

**Patients:** 3867 patients with newly diagnosed Type 2 DM (mean age 53 yr, 61% men, 81% white, mean fasting plasma glucose (FPG) 6.1-15.0 mmol/L). Exclusions included severe cardiovascular disease, renal disease, retinopathy, and others.

**Intervention:** Intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L) vs. conventional treatment with diet alone (target FPG <15 mmol/L without hyperglycemic symptoms).

**Main outcomes:** Diabetes-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia), diabetes-related death, and all-cause mortality.

**Results:** Patients allocated to intensive treatment had lower median HbA1c levels ( $p<0.001$ ).

Outcome	RRR % (p value)
Diabetes-related endpoint	12 (0.029)
Diabetes-related death	10 (0.34)
All-cause mortality	6 (0.44)

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.

**Conclusion:** Intensive blood glucose control reduces microvascular, but not macrovascular complications in Type 2 DM.

**Table 8. Comparison of Type 1 and Type 2 Diabetes Mellitus** (continued)

	Type 1	Type 2
<b>Risk Factors</b>	<ul style="list-style-type: none"> <li>Personal history of other autoimmune diseases including Graves', myasthenia gravis, autoimmune thyroid disease, celiac disease and pernicious anemia</li> </ul>	<ul style="list-style-type: none"> <li>Age &gt;40 yr</li> <li>Abdominal obesity/overweight</li> <li>First-degree relative with DM</li> <li>Race/ethnicity (Black, Aboriginal, Hispanic, Asian-American, Pacific Islander)</li> <li>Hx of IGT or IFG</li> <li>HTN</li> <li>Dyslipidemia</li> <li>PCOS</li> <li>Hx of gestational DM or macrosomic baby</li> <li>Schizophrenia</li> <li>Fatty liver</li> <li>Hyperuricemia</li> </ul>
<b>Body Habitus</b>	<ul style="list-style-type: none"> <li>Normal to thin</li> </ul>	<ul style="list-style-type: none"> <li>Typically overweight with increased central obesity</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>Insulin</li> </ul>	<ul style="list-style-type: none"> <li>Lifestyle modification</li> <li>Oral antihyperglycemic agents</li> <li>Incretin therapy</li> <li>Insulin therapy</li> </ul>
<b>Acute Complication</b>	<ul style="list-style-type: none"> <li>Diabetic ketoacidosis (DKA) in severe cases</li> </ul>	<ul style="list-style-type: none"> <li>Hyperosmolar hyperglycemic state (HHS)</li> <li>DKA in severe cases</li> </ul>
<b>Screening</b>	<ul style="list-style-type: none"> <li>Subclinical prodrome can be detected in first and second-degree relatives of those with Type 1 DM by the presence of pancreatic islet autoantibodies</li> </ul>	<ul style="list-style-type: none"> <li>Screen individuals with risk factors</li> </ul>

#### Targeting Intensive Glycemic Control versus Targeting Conventional Glycemic Control for Type 2 Diabetes Mellitus

*Cochrane DB Syst Rev* 2011;6:CD008143

**Study:** Systematic review of randomized clinical trials of glycemic control in adults with T2DM.

**Patients:** Twenty trials randomized 16,106 patients with Type 2 DM to intensive control and 13,880 patients with Type 2 DM to conventional glycemic control.

**Intervention:** Intensive glycemic control (HbA1c ≤6.5%) versus conventional glycemic control (determined by local guidelines).

**Primary Outcomes:** All-cause mortality, composite macrovascular (death from cardiovascular cause, nonfatal MI, nonfatal stroke) and microvascular events (nephropathy, retinopathy).

**Results:** There was no significant difference between targeting intensive and conventional glycemic control for all-cause mortality or cardiovascular mortality. Targeting intensive glycemic control reduced the risk of amputation, the composite risk of microvascular disease, retinopathy, retinal photocoagulation, and nephropathy. The risks of both mild and severe hypoglycemia were increased with targeting intensive glycemic control.

**Conclusions:** Intensive glycemic control did not reduce all-cause mortality and cardiovascular mortality compared to conventional glycemic control. Intensive glycemic control reduced the risk of microvascular complications while increasing the risk of hypoglycemia. Intensive glycemic control may also reduce the risk of non-fatal MI in trials exclusively dealing with glycemic control in usual care settings.

#### Canadian Diabetes Guidelines 2013

	Target
HbA1c	<7.0%
Fasting plasma glucose	4-7 mmol/L (72-126 mg/dL)
2h post prandial glucose	5-10 mmol/L (90-180 mg/dL)
	5-8 mmol/L (90-144 mg/dL) if not meeting target A1c and can be safely achieved
Lipids	As per high risk group if age >40 or age >30 if diabetes duration >15 yr
Blood pressure	<130/80

## Treatment of Diabetes

### Glycemic Targets

- HbA1c reflects glycemic control over 3 mo and is a measure of patient's long-term diabetes control
- therapy in most individuals with type 1 or type 2 diabetes should be targeted to achieve a HbA1c ≤7.0% in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, HbA1c <6.5%, may be targeted in patients with a shorter duration of diabetes with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- a HbA1c target <8.5% may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple co-morbidities, extensive CAD, and a failure to attain established glucose targets despite treatment intensification
- there may be harm associated with strategy to target HbA1c <6.0% in certain patients with Type 2 DM (see ACCORD trial, E9)

### Diet

- daily carbohydrate intake 45-60% of energy, protein 15-20% of energy and fat <35% of energy
- intake of saturated fats <7% and polyunsaturated fats <10% of total calories each
- limit sodium, alcohol and caffeine intake
- Type 1: carbohydrate counting is used to titrate insulin regimen
- Type 2: weight reduction

### Lifestyle

- regular physical exercise to improve insulin sensitivity, lower lipid concentrations and control blood pressure
- smoking cessation

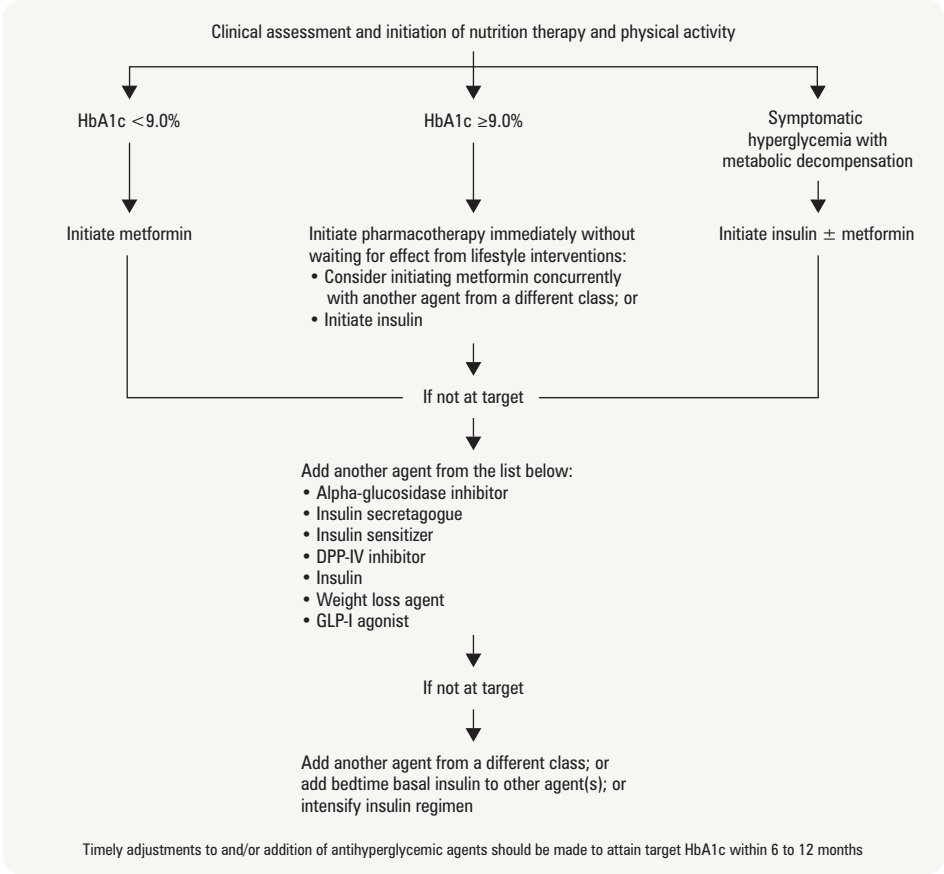

### Medical Treatment: Oral Antihyperglycemic Agents and/or Incretin Therapy (Type 2 DM)

- initiate oral antihyperglycemic therapy and/or incretin therapy within 2-3 mo if lifestyle management does not result in glycemic control
- if HbA1c >9.0%, initiate pharmacologic therapy immediately and consider combination oral therapy or insulin immediately
- see *Common Medications*, E52 for details on antihyperglycemic agents

### Medical Treatment: Insulin (Figure 5)

- used for Type 1 DM at onset, may be used in Type 2 DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin lispro, Insulin glulisine)

- basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, Insulin glargine)
- premixed insulins (% Humulin R and % NPH) 30/70; premixed insulin analogues (Biphasic Insulin aspart, Insulin lispro/lispro protamine)
- estimated total daily insulin requirement: 0.5-0.7 units/kg (often start with 0.3-0.5 units/kg/day)

**Figure 4. Approach to treatment of hyperglycemia in type 2 DM**  
Adapted from: Can J Diabetes 2008;32(suppl1):S56

**Table 9. Available Insulin Formulations**

Insulin Type (trade name)	Onset	Peak	Duration
PRANDIAL (BOLUS) INSULINS			
Rapid-acting insulin analogues			
• Insulin aspart (NovoRapid®)	10-15 min	1-1.5 h	3-5 h
• Insulin lispro (Humalog®)	10-15 min	1-2 h	3.5-4.75 h
• Insulin glulisine (Apidra®)	10-15 min	1-1.5 h	3-5 h
Short-acting insulins			
• Humulin R®	30 min	2-3 h	6.5 h
• Novolin Toronto®			
BASAL INSULINS			
Intermediate-acting			
• Humulin N®	1-3 h	5-8 h	Up to 18 h
• Novolin NPH®			
Long-acting basal insulin analogues			
Insulin detemir (Levemir®)	90 min	Not applicable	Up to 24 h (glargine 24 h, detemir 16-24 h)
Insulin glargine (Lantus®)			
PRE-MIXED INSULINS			
Premixed regular insulin – NPH			
• Humulin 30/70®	A single vial or cartridge contains a fixed ratio of insulin (% of rapid acting or short-acting insulin to % of intermediate-acting insulin)		
• Novolin 30/70®			
Premixed insulin analogues			
• Biphasic insulin aspart (NovoMix 30®)			
• Insulin lispro/lispro protamine (Humalog Mix25® and Mix50®)			

**Effects of Intensive Glucose Lowering in Type 2 DM: The ACCORD Trial**

*NEJM* 2008;358:2545-2559  
**Study:** Multicentre RCT.  
**Patients:** 10,251 patients (mean age 62.2) with Type 2 DM, and cardiovascular risk factors.  
**Intervention:** Intensive therapy targeting a HbA1c level of less than 6.0% or standard therapy targeting 7.0 to 7.9%.  
**Outcomes:** First occurrence of nonfatal MI, nonfatal stroke, or death from CV causes.  
**Results:** The intensive therapy arm was stopped early (3.5 yr vs. 5.6 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV-cause mortality, nonfatal MI, and all congestive heart failure in the intensive therapy group. There were increased rates of all hypoglycemic events, any nonhypoglycemic serious adverse event, fluid retention, and weight gain > 10 kg, but lower systolic and diastolic blood pressure in the intensive therapy group. There was an increased incidence of elevated ALT (>3 times upper limit) and ACE drug use in the standard therapy group.  
**Conclusions:** Intensive glucose lowering therapy in Type 2 DM does not improve clinic outcomes and actually increases the risk of mortality with more adverse events compared to standard therapy. Additional research is required to discern the cause.

**Effects of Intensive Blood Pressure Control in Type 2 DM: The ACCORD Trial**

*NEJM* 2010;362:1575-1585  
**Study:** RCT, unblinded with 4.7 yr of mean follow-up.  
**Population:** 4,733 patients with type 2 DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (sBP) between 130-180 mmHg.  
**Intervention:** sBP control less than 120 mmHg (intensive) or 140 mmHg (standard).  
**Primary Outcomes:** Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).  
**Results:** Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI, 3.4-3.5) versus 2.1 (95%, 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 1.27%, p=<0.001); especially bradycardia or arrhythmia (0.5% vs. 0.13%, p=0.02) and hyperkalemia (0.4% vs. 0.04%, p=0.01). There was no significant difference in primary outcomes in the two study arms, or all-cause mortality. There was a significant reduction in any stroke (0.32%/yr vs. 0.53%/yr, p=0.01) and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, p=0.03) in the intensive therapy arm.  
**Conclusions:** Intensive BP lowering to less than 120 mmHg versus 140 mmHg in patients with Type 2 DM and CV risk factors does not reduce major CV event risk reduction except for stroke events.

**Effects of Combination Lipid Therapy in Type 2 DM: the ACCORD Trial**

*NEJM* 2010;362:1563-1574  
**Study:** RCT, double-blinded trial with 4.7 yr of mean follow-up.  
**Population:** 5,518 patients with type 2 DM.  
**Intervention:** Statin with or without fibrate therapy.  
**Primary Outcome:** Major cardiovascular (CV) event (composite nonfatal MI, nonfatal stroke, or CV-related death).  
**Results:** No significant differences in primary outcome between the two arms. No difference in all MI, all stroke, or all-cause mortality between study arms.  
**Conclusions:** The addition of fibrate therapy to statin therapy in patients with Type 2 DM does not reduce major CV event risk.

Figure 5. Duration of activity of different insulins

## Insulin Regimens

Table 10. Insulin Regimens for T2DM and T1DM

Regimen	Administration
T2DM Oral hypoglycemic agent + basal insulin	<ul style="list-style-type: none"> <li>Start with 10 units at bedtime of basal insulin</li> <li>Titrate up by 1 unit until FBG &lt;7.0 mmol/L (126 mg/dL)</li> </ul>
T1DM Multiple daily injections (MDI)	<ul style="list-style-type: none"> <li>Estimated total insulin requirement is 0.5-0.7 U/kg</li> <li>40% is given as basal insulin at bedtime</li> <li>20% is given as bolus insulin before breakfast, lunch and dinner</li> <li>Continue metformin but discontinue secretagogue</li> </ul>
Split-mixed	<ul style="list-style-type: none"> <li>Estimated total insulin requirement is 0.5-0.7 U/kg</li> <li>2/3 dose is given as pre-mixed insulin before breakfast</li> <li>1/3 dose is given as pre-mixed insulin before dinner</li> <li>Continue metformin but discontinue secretagogue</li> </ul>

\*Bolus insulin: Aspart, Glulisine, Lispro

\*Basal insulin: Glargine, Detemir, NPH

\*Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, Humalog Mix25, Humalog Mix50

Table 11. Titrating Insulin Doses

Hyperglycemic Reading	Insulin Correction
High AM sugar	Increase bedtime basal insulin
High lunch sugar	Increase AM rapid/regular insulin
High supper sugar	Increase lunch rapid/regular insulin, or Increase AM basal insulin
High bedtime sugar	Increase supper rapid/regular insulin

## Variable Insulin Dose Schedule ("Sliding/Supplemental/Correction Scale")

- for patients on Basal-Bolus MDI regimen: patient takes usual doses of basal insulin but varies doses of bolus insulin based on BG reading at time of dose
- use baseline bolus insulin dose when within BG target range; add or subtract units when above or below target
- when used in hospital (including perioperative management of diabetes) patient should also receive basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia without intervention
- construction of a supplemental sliding scale for a patient on anti-hyperglycemics:
  - Correction Factor (CF) =  $100/\text{Total Daily Dose of insulin (TDD)}$
  - BG <4: call MD and give 15 g carbohydrates
  - BG between 4 to 8: no additional insulin
  - BG between 8 to (8 + CF): give one additional unit
  - BG between (8 + CF) to (8 + 2CF): give two additional units
  - BG between (8 + 2CF) to (8 + 3CF): give three additional units

## Insulin Pump Therapy [continuous subcutaneous insulin infusion (CSII)]

- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected

### DPP-IV Inhibitors

- Newer antihyperglycemic agents (e.g. sitagliptin, saxagliptin) that inhibit the degradation of endogenous incretin hormones like GLP-1
- Stimulate insulin secretion, inhibit glucagon release from the pancreas

### GLP-1 Analogues (Incretins)

- Human glucagon-like peptide-1 analogues: exenatide, liraglutide
- Increase insulin secretion, decreases inappropriate glucagon secretion, increases B-cell growth/replication, slows gastric emptying and decreases food intake
- Associated with weight loss
- Subcutaneous formulation

### Treatment of DKA/HHS

- Fluids
- Insulin
- Potassium
- Search for and treat precipitant

### Conversion Chart for percentage HbA1c to average blood sugar control

Average blood sugar level (mmol/L)	Hemoglobin A1c (% HbA1c)
17	12%
16	11%
14	10%
12	9%
10	8%
8	7%
6	6%

Conversion chart adapted from Nathan DM *et al.* The clinical information value of a glycosylated hemoglobin assay. *NEJM* 1984;310:341-346

### The 8 Is Precipitating DKA:

- Infection
- Ischemia or Infarction
- Iatrogenic (glucocorticoids)
- Intoxication
- Insulin missed
- Initial presentation
- Intra-abdominal process (e.g. pancreatitis, cholecystitis)
- Intraop/periop stress

## Acute Complications

**Table 12. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States**

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic State (HHS)
<b>Pathophysiology</b>	<ul style="list-style-type: none"> <li>Usually occurs in Type 1 DM</li> <li>Insulin deficiency with ↑ counterregulatory hormones (glucagon, cortisol, catecholamines, GH)</li> <li>Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise)</li> <li>Unrestricted hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ Na<sup>+</sup> (water shift to ECF)</li> <li>Fat mobilization → ↑ FFA → ketoacids → metabolic acidosis</li> <li>Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria</li> <li>Total body K<sup>+</sup> depletion but serum K<sup>+</sup> may be normal or elevated 2° to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality</li> <li>Total body PO<sub>4</sub><sup>3-</sup> depletion</li> </ul>	<ul style="list-style-type: none"> <li>Occurs in Type 2 DM</li> <li>Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns</li> <li>Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglucagonemia and hepatic glucose production</li> <li>Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis</li> <li>Characterized by hyperglycemia, hyperosmolality, and dehydration without ketosis</li> <li>More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly</li> <li>Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma</li> </ul>
<b>Clinical Features</b>	<ul style="list-style-type: none"> <li>Polyuria, polydipsia, polyphagia with marked fatigue, nausea, vomiting</li> <li>Dehydration (orthostatic changes)</li> <li>LOC may be ↓ with ketoacidosis or with high serum osmolality (osm &gt; 330 mmol/L)</li> <li>Abdominal pain</li> <li>Fruity smelling breath</li> <li>Kussmaul's respiration</li> </ul>	<ul style="list-style-type: none"> <li>Onset is insidious → preceded by weakness, polyuria, polydipsia</li> <li>History of decreased fluid intake</li> <li>History of ingesting large amounts of glucose containing fluids</li> <li>Dehydration (orthostatic changes)</li> <li>↓ LOC → lethargy, confusion, comatose due to high serum osmolality</li> <li>Kussmaul's respiration is absent unless the underlying precipitant has also caused a metabolic acidosis</li> </ul>
<b>Serum</b>	<ul style="list-style-type: none"> <li>↑ BG (typically 11-55 mmol/L, 198-990 mg/dL), ↓ Na<sup>+</sup> (2° to hyperglycemia → for every ↑ in BG by 10 mmol/L (180 mg/dL) there is a ↓ in Na<sup>+</sup> by 3 mmol/L)</li> <li>Normal or ↑ K<sup>+</sup>, ↓ HCO<sub>3</sub><sup>-</sup>, ↑ BUN, ↑ Cr, ketonemia, ↓ PO<sub>4</sub><sup>3-</sup></li> <li>↑ osmolality</li> </ul>	<ul style="list-style-type: none"> <li>↑ BG (typically 44.4-133.2 mmol/L, 800-2400 mg/dL)</li> <li>In mild dehydration, may have hyponatremia (spurious 2° to hyperglycemia → for every ↑ in BG by 10 mmol/L (180 mg/dL) there is a ↓ in Na<sup>+</sup> by 3 mmol/L) – if dehydration progresses, may get hypernatremia</li> <li>Ketosis usually absent or mild if starvation occurs</li> <li>↑ osmolality</li> </ul>
<b>ABG</b>	<ul style="list-style-type: none"> <li>Metabolic acidosis with ↑ AG, possible 2° respiratory alkalosis</li> <li>If severe vomiting/dehydration there may be a metabolic alkalosis</li> </ul>	<ul style="list-style-type: none"> <li>Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI)</li> </ul>
<b>Urine</b>	<ul style="list-style-type: none"> <li>+ve for glucose and ketones</li> </ul>	<ul style="list-style-type: none"> <li>-ve for ketones unless there is starvation ketosis</li> <li>Glycosuria</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>Immediate resuscitation and emergency measures if patient is stuporous or comatose</li> <li>Monitor degree of ketoacidosis with AG, not BG or serum ketone level</li> <li>Rehydration:               <ul style="list-style-type: none"> <li>1 L/h NS in first 2 h</li> <li>after 1st 2 L, 300-400 mL/h 0.45% NaCl (continue NS if corrected sodium is falling faster than 3 mosm/kg water/h)</li> <li>once BG reaches 13.9 mmol/L (250 mg/dL) then switch to D5W to maintain BG in the range of 13.9–16.6 mmol/L (250-300 mg/dL)</li> </ul> </li> <li>Insulin therapy:               <ul style="list-style-type: none"> <li>critical to resolve acidosis, not hyperglycemia</li> <li>do not use with hypokalemia (see below), until serum K<sup>+</sup> is corrected to &gt; 3.3 mmol/L</li> <li>use only regular insulin (R)</li> <li>maintain on 0.1 U/kg/h insulin R infusion</li> <li>check serum glucose hourly</li> </ul> </li> <li>K<sup>+</sup> replacement:               <ul style="list-style-type: none"> <li>with insulin administration, hypokalemia may develop</li> <li>if serum K<sup>+</sup> &lt; 3.3 mmol/L, hold insulin and give 40 mEq/L K<sup>+</sup> replacement</li> <li>when K<sup>+</sup> 3.5-5.0 mmol/L add KCl 20-40 mEq/L IV fluid to keep K<sup>+</sup> in the range of 3.5-5 mEq/L</li> </ul> </li> <li>HCO<sub>3</sub><sup>-</sup>:               <ul style="list-style-type: none"> <li>if pH &lt; 7.0 or if hypotension, arrhythmia or coma is present with a pH of &lt; 7.1 give HCO<sub>3</sub><sup>-</sup> in 0.45% NaCl</li> <li>do not give if pH &gt; 7.1 (risk of metabolic alkalosis!)</li> <li>can give in case of life-threatening hyperkalemia</li> </ul> </li> <li>± mannitol (for cerebral edema)</li> </ul>	<ul style="list-style-type: none"> <li>Same resuscitation and emergency measures as DKA</li> <li>Rehydration:               <ul style="list-style-type: none"> <li>IV fluids: 1 L/h NS initially</li> <li>evaluate corrected serum Na<sup>+</sup></li> <li>if corrected serum Na<sup>+</sup> high or normal, switch to 0.45% NaCl (4-14 mL/kg/h)</li> <li>if corrected serum Na<sup>+</sup> low, maintain NS (4-14 mL/kg/h)</li> <li>when serum BG reaches 13.9 mmol/L (250 mg/dL) switch to D5W</li> </ul> </li> <li>K<sup>+</sup> replacement:               <ul style="list-style-type: none"> <li>less severe K<sup>+</sup> depletion compared to DKA</li> <li>if serum K<sup>+</sup> &lt; 3.3 mmol/L, hold insulin and give 40 mEq/L K<sup>+</sup> replacement</li> <li>if K<sup>+</sup> is 3.3-5.0, give KCl 20-30 mEq/L IV fluid</li> <li>if serum K<sup>+</sup> ≥ 5.5 mmol/L, check K<sup>+</sup> every 2 h</li> </ul> </li> <li>Search for precipitating event</li> <li>Insulin therapy:               <ul style="list-style-type: none"> <li>use only regular insulin (R)</li> <li>initially load 0.1 U/kg body weight insulin R bolus</li> <li>maintenance 0.1 U/kg/h insulin R infusion or IM</li> <li>check serum glucose hourly</li> <li>in general lower insulin requirement compared to DKA</li> </ul> </li> </ul>
<b>Prognosis</b>	<ul style="list-style-type: none"> <li>2-5% mortality in developed countries</li> <li>Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children)</li> </ul>	<ul style="list-style-type: none"> <li>Overall mortality approaches 50% primarily because of the older patient population and underlying etiology/precipitant</li> </ul>

## Macrovascular Complications

- increased risk of coronary artery disease (CAD), ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- coronary artery disease (see [Cardiology, C22](#))
  - risk of MI is 3-5x higher in those with diabetes compared to age-matched controls
  - CAD is the leading cause of death in Type 2 DM
  - most patients with DM are considered “high risk” under the risk stratification for CAD (see *Dyslipidemias, E2*)
- ischemic stroke (see [Neurology, N43](#))
  - risk of stroke is approximately 2.5x higher in those with diabetes
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see [Cardiology, C44](#))
  - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with diabetes compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with diabetes
- treatment
  - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight low density lipoprotein (LDL) cholesterol control [LDL <2.0 mmol/L (77 mg/dL)]
  - ACE inhibitor or angiotensin receptor blocker in high-risk patients
  - smoking cessation

### All Ketonemia is not DKA:

Consider starvation or alcohol ketosis.

Average fluid loss runs at 3-6 L in DKA, and 8-10 L in HHS.

### Laboratory Testing: Ketones

The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect  $\beta$ -hydroxybutyrate (BHB), the ketone most frequently in excess. This has two clinical consequences:

- Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB.
- As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving.

## Microvascular Complications

### DIABETIC RETINOPATHY (see [Ophthalmology, OP35](#))

#### Epidemiology

- Type 1 DM: 25% affected at 5 yr, 100% at 20 yr
- Type 2 DM: 25% affected at diagnosis, 60% at 20 yr
- leading cause of blindness in North America between the ages of 20-74
- most important factor is disease duration

#### Clinical Features

- nonproliferative
  - asymptomatic but if macular involvement occurs vision may be impaired
  - microaneurysms, hard exudates, dot-blot and flame hemorrhages
- preproliferative
  - macular edema, cotton wool spots, venous shunts and beading, intra-retinal microvascular abnormalities (IRMA)
- proliferative
  - with neovascularization and fibrous scarring; great risk for loss of vision secondary to vitreous hemorrhage (floaters) and/or retinal detachment

#### Treatment and Prevention

- tight glycemic control (delays onset, decreases progression), tight lipid control, manage hypertension, smoking cessation
- pan-retinal laser photocoagulation for treatment of neovascularization
- vitrectomy
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of Type 2 DM; 5 yr after diagnosis of Type 1 DM)
- interval for follow-up should be tailored to severity of retinopathy

### Effect of a Multifactorial Intervention on Mortality in Type 2 DM: The Steno-2 Study

NEJM 2008;358:580-591

**Study:** Single centre RCT.

**Patients:** Patients (n=160) with Type 2 DM and persistent microalbuminuria.

**Intervention:** Random assignment to receive either conventional multifactorial treatment or intensified, target-driven therapy involving a combination of medications and focused behaviour modification. Targets included an HbA1c level of <6.5%, a fasting serum total cholesterol level of <4.5 mmol/L, a fasting serum triglyceride level of <1.7 mmol/L, a sBP of <130 mmHg, and a dBP of <80 mmHg. Patients were treated with blockers of the renin-angiotensin system because of their microalbuminuria, regardless of blood pressure, and received low-dose Aspirin® as primary prevention.

**Outcomes:** The primary end point was the time to death from any cause. Other endpoints examined were death from CV causes and various CV events along with diabetic neuropathy, nephropathy, and retinopathy.

**Results:** Twenty-four patients in the intensive-therapy group died, as compared with 40 in the conventional-therapy group (hazard ratio, 0.54; 95% confidence interval [CI], 0.32 to 0.89; p=0.02). Intensive therapy was associated with a lower risk of death from CV causes (hazard ratio, 0.43; 95% CI, 0.19 to 0.94; p=0.04) and of CV events (hazard ratio, 0.41; 95% CI, 0.25 to 0.67; p<0.001). One patient in the intensive-therapy group had progression to end-stage renal disease, as compared with six patients in the conventional-therapy group (p=0.04). Fewer patients in the intensive-therapy group required retinal photocoagulation (relative risk, 0.45; 95% CI, 0.23 to 0.86; p=0.02).

**Conclusions:** In at-risk patients with Type 2 DM, intensive intervention with multiple drug combinations and behaviour modification had sustained beneficial effects with respect to vascular complications and on rates of death from any cause and from CV causes.

**DIABETIC NEPHROPATHY** (see [Nephrology](#), NP28)**Epidemiology**

- diabetes-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with Type 1 DM (after 5-10 yr) and 4-20% with Type 2 DM have progressive nephropathy

**Pathophysiology**

- thickening of capillary basement membrane and glomerular mesangium resulting in glomerulosclerosis and renal insufficiency
- diffuse glomerulosclerosis is more common than nodular intercapillary glomerulosclerosis (Kimmelstiel-Wilson lesions)

**Screening**

- serum creatinine
- random urine test for albumin to creatinine ratio (ACR) plus urine dipstick test for all Type 2 DM patients at diagnosis, then annually, and for postpubertal Type 1 DM patients with  $\geq 5$  yr duration of DM

**Clinical Features**

- initial changes include microalbuminuria, increased GFR (up to 140%) from hyperfiltration, enlarged kidneys
- microalbuminuria: ACR of  $>2.0$  mg/mmol (men) or  $>2.8$  mg/mmol (women)
- macroalbuminuria: ACR of  $>20.0$  mg/mmol (men) or  $>28.0$  mg/mmol (women)
- progression over 15 yr to cause hypertension, persistent proteinuria (macroalbuminuria), nephrotic syndrome, and renal failure
- elevated HbA1c is an independent risk factor for progression to microalbuminuria

**Treatment and Prevention**

- tight glycemic control
- tight blood pressure control ( $<130/80$  mmHg): can use either ACEI or ARB (often used first line for their CVD protection)
- even in the absence of glycemic control ACEIs or ARBs reduce the level of albuminuria and the rate of progression of renal disease in normotensive and hypertensive patients with Type 1 or Type 2 DM
- Type 1 DM  $\rightarrow$  CKD with either hypertension or albuminuria  $\rightarrow$  ACEIs 1st line; ARBs 2nd line
- Type 2 DM  $\rightarrow$  CKD with hypertension and albuminuria  $\rightarrow$  ACEIs or ARBs (dose adjust if creatinine clearance (CrCl)  $<60$  mL/min)
- consider use of non-dihydropyridine calcium channel blocker (e.g. diltiazem) in those unable to tolerate both ACEIs and ARBs
- limit use of nephrotoxic drugs and dyes
- renal failure may necessitate hemodialysis and renal transplant

**DIABETIC NEUROPATHY** (see [Neurology](#), N37)**Epidemiology**

- approximately 50% of patients within 10 yr of onset of Type 1 DM and Type 2 DM

**Pathophysiology**

- can have peripheral sensory neuropathy, motor neuropathy or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
- the more common motor and sensory neuropathies are thought to be related to metabolic or osmotic toxicity secondary to increased sorbitol and/or decreased myoinositol (possible mechanisms include accumulation of advanced glycation endproducts [AGE], oxidative stress, protein kinase C, nerve growth factor deficiency)

**Screening**

- 128 Hz tuning fork or 10 g monofilament at diagnosis and annually in people with Type 2 DM and after 5 yr duration of Type 1 DM

**Management of Diabetic Retinopathy: A Systematic Review**

JAMA 2007;298:902-916

**Purpose:** To review the best evidence for primary and secondary interventions in the management of diabetic retinopathy (DR), including diabetic macular edema.

**Study Selection:** English-language RCTs with more than 12 mo of follow-up and meta-analyses were included.

**Results:** Forty-four studies (including 3 meta-analyses) met the inclusion criteria. Tight glycemic and blood pressure control reduces the incidence and progression of DR. Pan-retinal laser photocoagulation reduces the risk of moderate and severe visual loss by 50% in patients with severe nonproliferative and proliferative retinopathy. Focal laser photocoagulation reduces the risk of moderate visual loss by 50 to 70% in eyes with macular edema. Early vitrectomy improves visual recovery in patients with proliferative retinopathy and severe vitreous hemorrhage. Intravitreal injections of steroids may be considered in eyes with persistent loss of vision when conventional treatment has failed.

**Conclusions:** Tight glycemic and blood pressure control remains the cornerstone in the primary prevention of DR. Pan-retinal and focal retinal laser photocoagulation reduces the risk of visual loss in patients with severe DR and macular edema, respectively. There is currently insufficient evidence to recommend routine use of other treatments.

## Clinical Features

**Table 13. Clinical Presentation of Diabetic Neuropathies**

Peripheral Sensory Neuropathy	Motor Neuropathy	Autonomic Neuropathy
Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation	Less common than sensory neuropathy	Postural hypotension, tachycardia, decreased cardiovascular response to Valsalva maneuver
Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands	Delayed motor nerve conduction and muscle weakness/atrophy	Gastroparesis and alternating diarrhea and constipation
Decreased ankle reflex	May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)	Urinary retention and erectile dysfunction
Symptoms may first occur in entrapment syndromes e.g. carpal tunnel	Some of the motor neuropathies spontaneously resolve after 6-8 wk	
May result in neuropathic ulceration of foot	Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell's palsy)	
	Diabetic amyotrophy: refers to pain, weakness, and wasting of hip flexors or extensors	

## Treatment and Management

- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
- medical, mechanical and surgical treatment for erectile dysfunction (see [Urology](#), U30)

### Effects of Treatments for Symptoms of Painful Diabetic Neuropathy: Systematic Review

BMJ 2007;335:87

**Purpose:** To evaluate the effects of treatments for the symptoms of painful diabetic neuropathy.

**Study Selection:** RCTs comparing topically applied and orally administered drugs with a placebo in adults with painful diabetic neuropathy.

**Results:** 25 included reports compared anticonvulsants (n=1270), antidepressants (94), opioids (329), ion channel blockers (173), NMDA antagonist (14), duloxetine (805), capsaicin (277), and isosorbide dinitrate spray (22) with placebo. The odds ratios in terms of 50% pain relief were 5.33 (95% confidence interval 1.77 to 16.02) for traditional anticonvulsants, 3.25 (2.27 to 4.66) for newer generation anticonvulsants, and 22.24 (5.83 to 84.75) for tricyclic antidepressants. The odds ratios in terms of withdrawals related to adverse events were 1.51 (0.33 to 6.96) for traditional anticonvulsants, 2.98 (1.75 to 5.07) for newer generation anticonvulsants, and 2.32 (0.59 to 9.69) for tricyclic antidepressants.

**Conclusion:** Anticonvulsants and antidepressants are still the most commonly used options to manage diabetic neuropathy. Tricyclic antidepressants and traditional anticonvulsants are better for short term pain relief than newer anticonvulsants. Evidence of the long term effects of antidepressants and anticonvulsants is lacking. Further studies are needed on opioids, NMDA antagonists, and ion channel blockers.

## Other Complications

### Dermatologic

- diabetic dermopathy: atrophic brown spots commonly in pretibial region known as “shin spots”, secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabetorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

### Bone and Joint Disease

- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren's contracture
- bone demineralization: bone density 10-20% below normal
- frozen shoulder

### Cataracts

- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

### Infections

- see [Infectious Diseases](#), ID16

## Hypoglycemia

### Etiology and Pathophysiology

- hypoglycemia occurs most frequently in people with diabetes receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without diabetes, care must be taken to distinguish fasting from post-prandial hypoglycemia as each invokes separate differential diagnoses

### Other Players in Glucose Homeostasis

These hormones act to increase blood glucose levels

- Glucagon
- Epinephrine
- Cortisol
- Growth hormone

### C-Peptide

A short peptide released into the circulation when proinsulin is cleaved to insulin.

**Table 14. Common Causes of Hypoglycemia**

Fasting		Post-Prandial (Nonfasting, Reactive)
Hyperinsulinism	Without Hyperinsulinism	
<ul style="list-style-type: none"> <li>Exogenous insulin</li> <li>Sulfonylurea or meglitinide reaction</li> <li>Autoimmune hypoglycemia (autoantibodies to insulin or insulin receptor)</li> <li>Pentamidine</li> <li>Pancreatic <math>\beta</math> cell tumour – insulinoma</li> </ul>	<ul style="list-style-type: none"> <li>Severe hepatic dysfunction</li> <li>Chronic renal insufficiency</li> <li>Hypocortisolism</li> <li>Alcohol use</li> <li>Non-pancreatic tumours</li> <li>Inborn error of carbohydrate metabolism, glycogen storage disease, gluconeogenic enzyme deficiency</li> </ul>	<ul style="list-style-type: none"> <li>Alimentary</li> <li>Functional</li> <li>Noninsulinoma pancreatogenous hypoglycemic syndrome</li> <li>Occult diabetes</li> <li>Leucine sensitivity</li> <li>Hereditary fructose intolerance</li> <li>Galactosemia</li> <li>Newborn infant of diabetic mother</li> </ul>

**Clinical Features**

- Whipple's triad
  - serum glucose  $<2.5$  mmol/L (45 mg/dL) in males and  $<2.2$  mmol/L (40 mg/dL) in females
  - neuroglycopenic symptoms
  - rapid relief provided by administration of glucose
- adrenergic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia
- neuroglycopenic symptoms (caused by decreased activity of CNS)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

**Investigations**

- electrolytes, creatinine, LFTs, drugs/toxins, cortisol
- if concerned about possible insulinoma:
  - bloodwork to be drawn when patient is hypoglycemic (e.g. during hospitalized 72-h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

**Treatment**

- for fasting hypoglycemia, must treat underlying cause
- for post-prandial (reactive) hypoglycemia, frequent small feeds
- see [Emergency Medicine](#), ER36
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV or 1 mg glucagon SC (if no IV available)
  - may need ongoing glucose infusion once BG  $>5$  mmol/L (90 mg/dL)

**Use C-peptide Levels to Distinguish between Exogenous and Endogenous Source of Hyperinsulinemia**  
 Increased = endogenous  
 Decreased or normal = exogenous

**Treatment of Acute Hypoglycemic Episode (Blood Glucose  $<4.0$  mmol/L) in the Awake Patient (e.g. able to self-treat)**

- 1) Eat 15 g of carbohydrates (CHO) (e.g. 3 packets sugar dissolved in water; 3/4 cup of juice)
- 2) Wait 15 min
- 3) Retest Blood Glucose (BG)
- 4) Repeat steps 1-3 until BG  $>5$  mmol/L
- 5) Eat next scheduled meal. If next meal is  $>1$  h away, eat snack including 15 g of CHO and protein.

**Hypoglycemia Unawareness: (Type 1 DM  $>>>$  Type 2 DM)**

Patient remains asymptomatic until severely hypoglycemic levels are reached

**Causes:**

- Decreased glucagon/epinephrine response
- History of repeated hypoglycemia or low HbA1c
- Autonomic neuropathy
- Not safe to drive

Suggest that patient obtain a Medic-Alert bracelet if at risk for hypoglycemia, especially with hypoglycemia unawareness.

**Features of Metabolic Syndrome**

Risk Factor	IDF (2005): to make diagnosis requires abdominal obesity + $\geq 2$ additional risk factors	ATP III (2005): requires $\geq 3$ risk factors
-------------	---	--

<b>Abdominal Obesity</b>		
Men	WC $\geq 94$ cm (37 inches)	WC $\geq 102$ cm (40 inches)
Women	WC $\geq 80$ cm (31.5 inches)	WC $\geq 88$ cm (35 inches)
<b>Triglyceride Level</b>		
	$\geq 1.7$ mmol/L (150 mg/dL)	$\geq 1.7$ mmol/L (150 mg/dL)
<b>HDL-C Level</b>		
Men	$<1.0$ mmol/L ( $<40$ mg/dL)	$<1.0$ mmol/L ( $<40$ mg/dL)
Women	$<1.3$ mmol/L ( $<50$ mg/dL)	$<1.3$ mmol/L ( $<50$ mg/dL)
<b>Blood Pressure</b>		
	$\geq 130/85$ mmHg	$\geq 130/85$ mmHg
<b>Fasting Glucose Level</b>		
	$\geq 5.6$ mmol/L ( $>100$ mg/dL)	$\geq 5.6$ mmol/L ( $>100$ mg/dL)

WC = Waist circumference

## Metabolic Syndrome

- several definitions, most widely used are National Cholesterol Education Program (NCEP/ATP III, updated by American Heart Association) and International Diabetes Federation (IDF) definitions (see sidebar)
- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, hypertension, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include diabetes, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

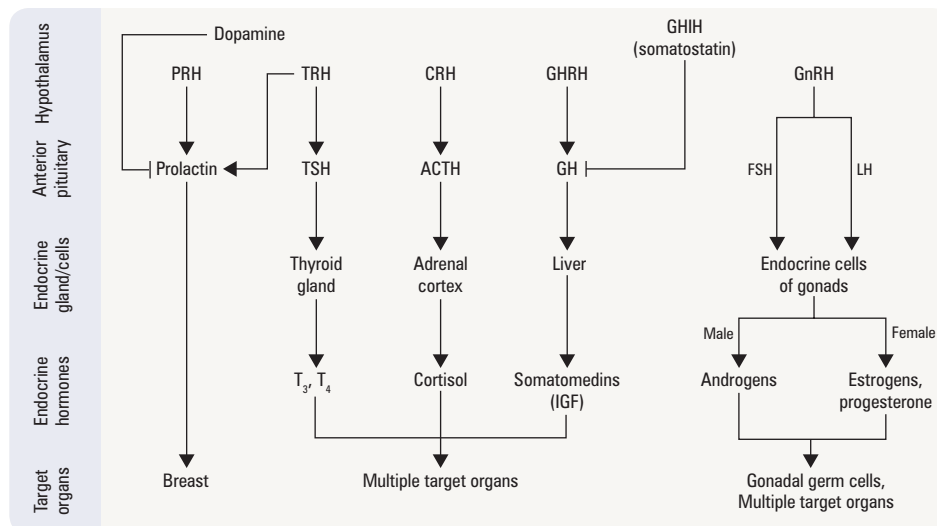

## Obesity

- see [Family Medicine](#), FM7

# Pituitary Gland

## Pituitary Hormones

**Figure 6. Hypothalamic-pituitary hormonal axes**

CRH = corticotropin-releasing hormone; GnRH = gonadotropin-releasing hormone; GHIH = growth hormone-inhibiting hormone; GHRH = growth hormone-releasing hormone; PRH = prolactin-releasing hormone; TRH = thyrotropin-releasing hormone

### Hypothalamic Control of Pituitary

- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except prolactin which is primarily under inhibitory control by dopamine, as well as GH and TSH which are inhibited by SS (somatostatin)
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones

### Anterior Pituitary Hormones

- growth hormone (GH), luteinizing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), adrenocorticotrophic hormone (ACTH), and prolactin (PRL)

### Posterior Pituitary (Hypothalamic) Hormones

- antidiuretic hormone (ADH) and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus these hormones are stored and released from the posterior pituitary

**Table 15. The Physiology and Action of Pituitary Hormones**

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
<b>ACTH</b>	<ul style="list-style-type: none"> <li>• Stimulates growth of adrenal cortex and secretion of its hormones</li> </ul>	<ul style="list-style-type: none"> <li>• Polypeptide</li> <li>• Pulsatile and diurnal variation (highest in AM, lowest at midnight)</li> </ul>	<ul style="list-style-type: none"> <li>• Dexamethasone</li> <li>• Cortisol</li> </ul>	<ul style="list-style-type: none"> <li>• CRH</li> <li>• Metyrapone</li> <li>• Insulin-induced hypoglycemia</li> <li>• Vasopressin</li> <li>• Fever, pain, stress</li> </ul>

## Growth Hormone (GH)

### GH DEFICIENCY

- cause of short stature in children (see [Pediatrics](#), P27)
- controversial significance in adults; often not clinically apparent, may present as fatigue

### GH EXCESS

- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly

#### Signs and Symptoms of Acromegaly:

##### ABCDEF

- Arthralgia/Arthritis
- Blood pressure raised
- Carpal tunnel syndrome
- Diabetes
- Enlarged organs
- Field defect (visual)

### Etiology

- GH secreting pituitary adenoma, carcinoid or pancreatic islet tumours secreting ectopic GHRH resulting in excess GH

### Pathophysiology

- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in growth hormone excess states secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

### Clinical Features

- enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, thickening of skin, increased sebum production, sweating, acne, sebaceous cysts, fibromata mollusca, acanthosis nigricans, arthralgia, carpal tunnel syndrome, degenerative osteoarthritis, thyromegaly, renal calculi, hypertension, cardiomyopathy, obstructive sleep apnea, colonic polyps and DM

**Investigations**

- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- elevated serum insulin-like growth factor-1 (IGF-1) is usually first line diagnostic test

**Treatment**

- surgery, octreotide (somatostatin analogue), dopamine agonist (bromocriptine/cabergoline), growth hormone receptor antagonist (pegvisomant), radiation

## Prolactin (PRL)

**HYPERPROLACTINEMIA****Etiology**

- pregnancy and breastfeeding
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumours may be induced by estrogens and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, antihypertensives, anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H<sub>2</sub>-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big big prolactin)

**Clinical Features**

- galactorrhea (secretion of breast milk in women and, rarely, men), infertility, hypogonadism, amenorrhea, erectile dysfunction

**Investigations**

- serum PRL, TSH, liver enzyme tests, creatinine
- MRI

**Treatment**

- long-acting dopamine agonist: bromocriptine, cabergoline or quinagolide (Norprolac®)
- surgery ± radiation (rare)
- prolactin-secreting tumours are very slow-growing and sometimes require no treatment
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

**Approach to Nipple Discharge**

- Differentiate between galactorrhea (fat droplets present) versus breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation, stress) versus pathologic
- If abnormal breast discharge, must rule out a breast malignancy

## Thyroid Stimulating Hormone (TSH)

- see *Thyroid*, E20

## Adrenocorticotrophic Hormone (ACTH)

- see *Adrenal Cortex*, E29

## Luteinizing Hormone (LH) and Follicle Stimulating Hormone (FSH)

- see *Gynecology*, GY4

**HYPOGONADOTROPIC HYPOGONADISM****Clinical Features**

- hypogonadism, amenorrhea, erectile dysfunction (see *Urology*, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development

**Treatment**

- Pergonal® (combined FSH/LH hormone therapy), hCG, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

**HYPERGONADOTROPIC HYPOGONADISM**

- 2° hypersecretion in gonadal failure (e.g. in menopause)

**Antidiuretic Hormone (ADH)****DIABETES INSIPIDUS (DI)****Definition**

- disorder resulting from deficient ADH action causing passage of large volumes of dilute urine

**Etiology and Pathophysiology**

- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, stalk lesion, hydrocephalus, histiocytosis X, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

**Clinical Features**

- passage of large volumes of dilute urine, polydipsia, dehydration; hypernatremia can develop with lack of access to water or impaired thirst mechanism

**Diagnostic Criteria**

- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
- response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

**Treatment**

- DDAVP/vasopressin for central DI
- chlorpropamide, clofibrate, thiazides, NSAIDs or carbamazepine as second line or for partial DI
- nephrogenic DI treated with solute restriction NSAIDs and thiazide diuretics; DDAVP (if partial)

**Diagnosing Subtypes of DI with DDAVP Response**

Concentrated urine = Central  
No effect = Nephrogenic

**SYNDROME OF INAPPROPRIATE ADH SECRETION (SIADH)****Diagnostic Criteria**

- hyponatremia with corresponding plasma hypo-osmolality, urine sodium concentration above 40 mEq/L, urine less than maximally diluted (>100 mOsm/kg), euvolemia (edema absent), and absence of adrenal, renal or thyroid insufficiency

**Etiology and Pathophysiology**

- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (TB, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

**Treatment**

- treat underlying cause, fluid restriction (800-1000 mL/day), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), and demeclocycline (antibiotic with anti-ADH properties, rarely-used) fludrocortisone, furosemide

**SIADH vs. Cerebral Salt Wasting (CSW)**

CSW can occur in cases of subarachnoid hemorrhage. Na<sup>+</sup> is excreted by malfunctioning renal tubules, mimicking findings of SIADH. Hallmark is hypovolemia

**Presentations of Pituitary Lesions:**

- Mass effect (visual field deficits, diplopia, ptosis, headaches, CSF leak)
- Hyperfunction
- Hypofunction

**Important Deficiencies to Recognize are:**

- Adrenal insufficiency
- Hypothyroidism

Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis.

**Pituitary Pathology****PITUITARY ADENOMA** (see [Neurosurgery](#), NS14)**Clinical Features**

- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies), headaches; increased ICP is rare
- hypofunction
  - hypopituitarism (see sidebar)
- hyperfunction
  - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumour)
  - tumours secreting LH, FSH and TSH are rare

### Investigations

- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing
- hypothalamic-pituitary hormonal function

### HYPOPITUITARISM

#### Etiology (the eight Is)

- Invasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid or dermoid), metastases
- Infarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache and altered level of consciousness; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
  - syphilis, TB, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
  - severe head trauma
- Immunologic
  - autoimmune destruction
- Iatrogenic
  - following surgery or radiation
- Idiopathic
  - familial forms, congenital midline defects

#### Investigations

- triple bolus test
  - stimulates release of all anterior pituitary hormones in normal individuals
  - rapid sequence of IV infusion of insulin, GnRH and TRH
  - insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and ACTH
  - GnRH (100 µg IV push) → increased LH and FSH
  - TRH (200 µg IV push over 60 s) → increased TSH and PRL (no longer available)

#### The Pituitary Hormones

Order they are usually lost with compression by a mass:

"Go Look For The Adenoma Please"

GH, LH, FSH, TSH, ACTH, PRL +

posterior pituitary hormones: ADH and oxytocin

## Thyroid

### Thyroid Hormones

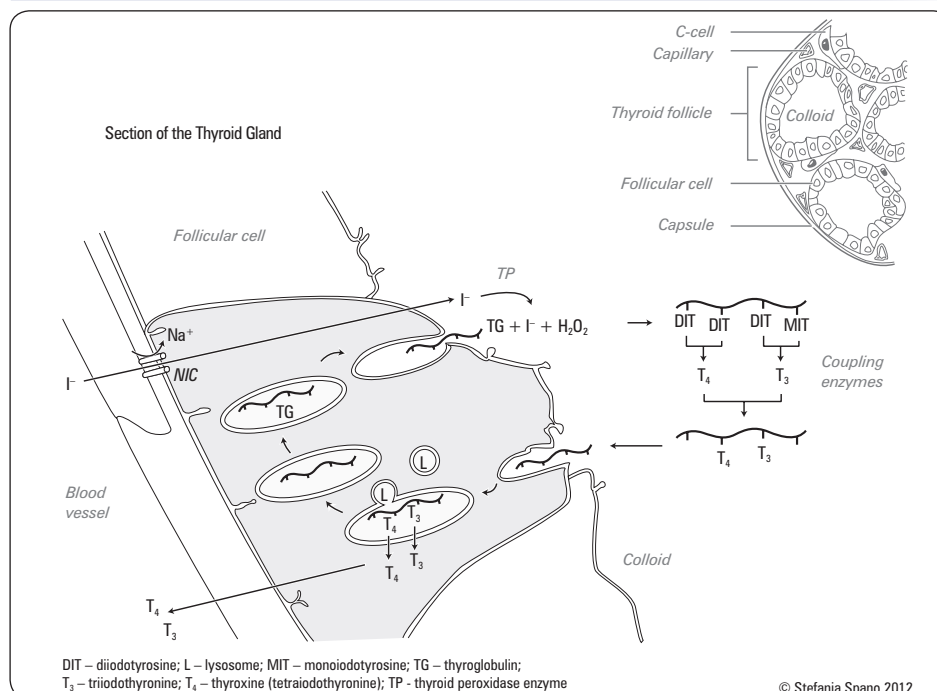

Figure 7. Thyroid hormone synthesis

### Synthetic Function of Thyroid Gland

- the synthesis of thyroid hormones  $T_4$  (thyroxine) and  $T_3$  (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, and release of  $T_3$  and  $T_4$
- free  $T_4$  (0.03%) and free  $T_3$  (0.3%) represent the hormonally active fraction of thyroid hormones
  - the remaining fraction is bound to thyroxine binding globulin (TBG) and albumin and is biologically inactive
- $T_3$  is more biologically active (3-8x more potent), but  $T_4$  has a longer half-life
- 85% of  $T_4$  is converted to  $T_3$  or reverse  $T_3$  (RT3) in the periphery by deiodinases
- RT3 is metabolically inactive but produced in times of stress to decrease metabolic activity
- most of the plasma  $T_3$  pool is derived from the peripheral conversion of  $T_4$
- calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells
  - it functions by inhibiting osteoclast activity and increasing renal calcium excretion

### Role of Thyroid Hormones

- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, effecting nearly every organ system
- they produce an increase in basal metabolic rate, including: increased  $Na^+/K^+$ ATPase activity, increase  $O_2$  consumption, increased respiration, heat generation, and increased cardiovascular activity
- also play crucial role during fetal life in both neurological and somatic development

### Regulation of Thyroid Function

- extrathyroid
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators)
  - $T_3$  negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- intrathyroid (autoregulation)
  - increasing iodide supply inhibits iodide organification, thus decreasing  $T_3$  and  $T_4$  synthesis (Wolff-Chaikoff effect)
  - there is varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of  $T_3$  to  $T_4$  in iodide deficiency
  - increased activity of peripheral 5' deiodinase in hypothyroidism increases  $T_3$  production despite low  $T_4$  levels

#### Thyroid Assessment

- Serum thyroid hormones (TSH,  $T_3$ ,  $T_4$ )
- Antibodies
- Thyroglobulin
- Thyroid ultrasound
- Nuclear uptake and scan
- Biopsy (FNA)

#### Patterns of Hormone Levels

	TSH	$T_3$ , $T_4$
1° Hyper	↓	↑
2° Hyper	↑	↑
1° Hypo	↑	↓
2° Hypo	↓	↓

#### Does this Patient have a Goitre?

##### From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3480618>

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of a goitre.

**Results:** Clinical diagnosis was based on degree of lateral prominence, visibility, and palpability of the thyroid gland. No evidence exists to support the superiority of any one method.

The combined results of 4 studies detail the predictive utility of assessing grades of thyroid gland weight:

Weight	Reference	LR+	95% CI
0-20 g	normal	0.15	(0.10-0.21)
20-40 g	1-2x	1.9	(1.1-3.0)
>40 g	>2x	25.0	(2.6-175)

Alternatively, defining a goiter as mass larger than the distal phalanx of the thumb has been shown to have an LR+ of 3.0 (95% CI, 2.5-3.5) and LR- of 0.30 (95% CI, 0.24-0.37) in children, and an LR+ of 4.7 (95% CI, 3.6-6.0) and LR- of 0.08 (95% CI, 0.02-0.27) for the presence of a goitre.

**Conclusions:** Use of weight of thyroid tissue is an appropriate method of diagnosing a goitre, while comparing the size of thyroid mass to the distal phalanx of the thumb may be a useful alternative.

## Tests of Thyroid Function and Structure

### TSH

- sensitive TSH (sTSH) is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating  $T_3$  and  $T_4$
  - secondary: increased TSH results in increased  $T_3$  and  $T_4$
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from  $T_3$  and  $T_4$
  - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

### Free $T_3$ and Free $T_4$

- indications: if secondary or tertiary (hypothalamic) hyper/hypothyroidism is suspected, or if normal TSH levels despite symptoms of hyper/hypothyroidism
- standard assessment of thyroid function measures TSH and if necessary free  $T_4$ . Free  $T_3$  should be measured if TSH is suppressed and free  $T_4$  is normal to rule out  $T_3$  toxicosis

### Thyroid Autoantibodies

- thyroglobulin antibodies (TgAb), thyroid peroxidase antibodies, TSH receptor inhibiting antibodies
  - increased in Hashimoto's disease; normal variant in 10-20% of individuals
- thyroid stimulating immunoglobulin (TSI)
  - increased in Graves' disease

### Plasma Thyroglobulin

- used to monitor residual thyroid activity post-thyroidectomy, e.g. for thyroid cancer recurrence
- normal or elevated levels may suggest persistent, recurrent or metastatic disease, especially on stimulation

### Serum Calcitonin

- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma or family history of MEN IIa or IIb syndromes

### Thyroid Imaging/Scans

- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, solid vs. cystic nodule, facilitate fine needle aspirate biopsy (FNAB)
- radioisotope thyroid scan (Technetium-99)
  - *test of structure*: order if there is a thyroid nodule and patient is hyperthyroid with low TSH
  - differentiates between hot (functioning → excess thyroid hormone production) and cold (non-functioning) nodules
    - ♦ hot nodule → very low chance malignancy; treat hyperthyroidism
    - ♦ cold nodule → ~5% chance malignancy; further work-up required (U/S and FNAB)
- radioactive iodine uptake (RAIU)
  - *test of function*: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland *in vivo*
  - if ↑ uptake (i.e. incorporated) → gland is overactive (hyperthyroid)
  - if ↓ uptake (i.e. not incorporated) → gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)

### Thyroid Biopsy

- fine needle aspiration (FNA) for cytology
  - differentiates between benign and malignant disease
  - best done under ultrasound guidance
  - accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

**Table 16. Summary of Diagnostic Testing in Hyperthyroidism and Hypothyroidism**

	Hyperthyroidism	Hypothyroidism
<b>TSH</b>	<ul style="list-style-type: none"> <li>• Decreased in 1° hyperthyroidism</li> <li>• Increased in 2° hyperthyroidism</li> </ul>	<ul style="list-style-type: none"> <li>• Increased in 1° hypothyroidism</li> <li>• Decreased in 2° hypothyroidism</li> </ul>
<b>Free T<sub>4</sub></b>	<ul style="list-style-type: none"> <li>• Increased in 1° hyperthyroidism</li> <li>• Increased in 2° hyperthyroidism</li> </ul>	<ul style="list-style-type: none"> <li>• Decreased in 1° hypothyroidism</li> <li>• Decreased in 2° hypothyroidism</li> </ul>
<b>Antibodies</b>	Graves': thyroid stimulating Ig (TSI)	Hashimoto's: antithyroid peroxidase (TPO)
<b>RAIU</b>	Increased uptake: <ul style="list-style-type: none"> <li>• Graves'</li> <li>• Toxic Multinodular goitre</li> <li>• Toxic adenoma</li> </ul>	Decreased uptake <ul style="list-style-type: none"> <li>• Subacute thyroiditis</li> <li>• Recent iodine load</li> <li>• Exogenous thyroid hormone</li> </ul>
<b>Radioisotope Thyroid Scan</b>	<ul style="list-style-type: none"> <li>• Graves': homogenous diffuse uptake</li> <li>• Multinodular goitre: heterogenous uptake</li> <li>• Toxic adenoma: single intense area of uptake with suppression elsewhere</li> </ul>	

#### Caution with Amiodarone

**Amiodarone-Induced Hypothyroidism (AIH):** AIH occurs more often in iodine-sufficient areas, and is more common in populations with a higher prevalence of autoimmune thyroid disease, such as women and the elderly. AIH can also occur in patients without pre-existing thyroid dysfunction.

**Amiodarone-Induced Thyrotoxicosis (AIT):** AIT occurs more often in iodine-deficient areas. It may occur in patients with pre-existing thyroid deficiencies, as an iodine load on an already dysfunctional thyroid may result in excessive thyroid hormone synthesis and release. AIT may also occur in patients without thyroid abnormalities through a cytotoxic mechanism that results in leakage of thyroid hormone into the systemic circulation.

#### Common Etiologies

Thyrotoxicosis	Hypothyroidism
Graves' Disease	Hashimoto's
Toxic Nodular Goitre	Congenital
Toxic Nodule	Iatrogenic (thionamides, radioactive iodine or surgery)
Thyroiditis	Hypothyroid phase of thyroiditis

## Thyrotoxicosis

### Definition

- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

### Epidemiology

- 1% of general population have hyperthyroidism
- F:M = 5:1

### Etiology and Pathophysiology

**Table 17. Differential Diagnosis of Thyrotoxicosis**

Disorder	TSH	Free T <sub>4</sub> /T <sub>3</sub>	Thyroid Antibodies	RAIU	Other
<b>HYPERTHYROIDISM</b>					
Graves' Disease	Decreased	Increased	TSI	Increased	
Toxic Nodular Goitre	Decreased	Increased	None	Increased	Heterogeneous uptake on scan
Toxic Nodule	Decreased	Increased	None	Increased	Hot nodule on scan
<b>THYROIDITIS</b>					
Subacute, Silent, Postpartum	Decreased	Increased	Up to 50% of cases	Decreased (becomes increased once entering hypothyroid phase, when TSH rises)	In classical subacute painful thyroiditis, ESR increased
<b>EXTRATHYROIDAL SOURCES OF THYROID HORMONE</b>					
Endogenous (struma ovariae, ovarian teratoma, metastatic follicular carcinoma)	Decreased	Increased	None	Decreased	
Exogenous (drugs)	Decreased	Increased (T <sub>4</sub> would be decreased if taking T <sub>3</sub> )	None	Decreased	

**Table 17. Differential Diagnosis of Thyrotoxicosis (continued)**

Disorder	TSH	Free T <sub>4</sub> /T <sub>3</sub>	Thyroid Antibodies	RAIU	Other
<b>EXCESSIVE THYROID STIMULATION</b>					
Pituitary thyrotrophoma	Increased	Increased	None	Increased	
Pituitary thyroid hormone receptor resistance	Increased	Increased	None	Increased	
Increased hCG (e.g. pregnancy)	Decreased	Increased	None	Increased DO NOT DO THIS TEST IN PREGNANCY	

**Clinical Features****Table 18. Clinical Features of Thyrotoxicosis**

<b>General</b>	Fatigue, heat intolerance, irritability, fine tremor
<b>CVS</b>	Tachycardia, atrial fibrillation, palpitations Elderly patients may have only cardiovascular symptoms, commonly new onset atrial fibrillation
<b>GI</b>	Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation)
<b>Neurology</b>	Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asians)
<b>GU</b>	Oligomenorrhea, amenorrhea, decreased fertility
<b>Dermatology</b>	Fine hair, skin moist and warm, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema Graves' disease: clubbing (acropachy), pretibial myxedema (rare)
<b>MSK</b>	Decreased bone mass, proximal muscle weakness
<b>Hematology</b>	Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally)
<b>Eye</b>	Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjunctival injection

**Treatment**

- thionamides: PTU or MMI; MMI recommended (except in first trimester pregnancy)
- $\beta$ -blockers for symptom control
- radioactive iodine thyroid ablation for Graves' disease
- surgery in the form of hemi, sub-total, or complete thyroidectomy

**Graves' Disease****Definition**

- syndrome characterized by hyperthyroidism with any of: diffuse goitre, ophthalmopathy, dermopathy

**Epidemiology**

- most common cause of thyrotoxicosis
- occurs at any age with peak in 3rd and 4th decade
- F > M = 7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA B8 and DR3
- may be associated with other inherited autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

**Etiology and Pathophysiology**

- autoimmune disorder due to a defect in T-suppressor cells
- B lymphocytes produce TSI that binds the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, lithium therapy, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy a result of increased tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit. This leads to fluid accumulation and displacement of the eye ball forward
- dermopathy may be related to cutaneous glycosaminoglycan deposition

**Clinical Features**

- signs and symptoms of thyrotoxicosis
- diffuse thyroid goitre  $\pm$  thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity if Graves' (plus signs of hyperthyroidism: lid retraction, characteristic stare)

**Signs and Symptoms of HYPERthyroidism**

Tremor  
Heart rate up  
Yawning (fatigued)  
Restlessness  
Oligomenorrhea/amenorrhea  
Intolerance to heat  
Diarrhea  
Irritability  
Sweating  
Muscle wasting/weight loss

**Caution with Thionamides**

These drugs are effective in controlling hyperthyroidism and induce permanent remission in 20-30% of patients with Graves' disease. They inhibit thyroid hormone synthesis. They are most often employed to achieve a euthyroid state before definitive treatment. Adverse effects include teratogenicity, agranulocytosis, hepatotoxicity and ANCA-positive vasculitis.

**Graves' Ophthalmopathy****NO SPECS (in order of changes usually)**

No signs  
Only signs: lid lag, lid retraction  
Soft tissue: periorbital puffiness, conjunctival injection, chemosis  
Proptosis/Exophthalmos  
Extraocular (diplopia)  
Corneal abrasions (since unable to close eyes)  
Sight loss

- dermatopathy (rare): pretibial myxedema (thickening of dermis that manifests as *non-pitting* edema)
- acropachy: clubbing and thickening of distal phalanges

### Investigations

- low TSH
- increased free  $T_4$  (and/or increased  $T_3$ )
- positive for TSI
- increased radioactive iodine uptake
- diffuse high uptake on thyroid scan (only do this test in the presence of nodule)

### Treatment

- thionamides
  - propylthiouracil (PTU) or methimazole (MMI)
  - inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines. PTU also inhibits peripheral deiodination of  $T_4$  to  $T_3$
  - continue treatment until remission occurs (20-40% of patients achieve spontaneous remission at 6-18 mo of treatment)
  - small goitre and recent onset are good indicators for long-term remission with medical therapy
  - major side effects: hepatitis, agranulocytosis and fever/arthritis
  - minor side effects: rash
  - iodinated contrast agents: sodium ipodate and iopanoic acid can inhibit conversion of  $T_4$  to  $T_3$  and are especially effective in combination with MMI
  - MMI preferred vs. PTU due to longer duration of action (once daily for most), more rapid efficacy, and lower incidence of side effects
  - MMI contraindicated in pregnancy (teratogenic), use PTU
- symptomatic treatment with  $\beta$ -blockers
- thyroid ablation with radioactive  $^{131}\text{I}$  if PTU or MMI trial does not produce disease remission
  - high incidence of hypothyroidism after  $^{131}\text{I}$  requiring lifelong thyroid hormone replacement
  - contraindicated in pregnancy
- subtotal or total thyroidectomy (indicated rarely for large goiters, suspicious nodule for CA, if patient is intolerant to thionamides and refusing RAI ablation)
  - risks include hypoparathyroidism and vocal cord palsy
- ophthalmopathy/orbitopathy
  - smoking cessation is most important
  - prevent drying
  - high dose prednisone in severe cases
  - orbital radiation, surgical decompression

### Prognosis

- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- lifetime follow-up needed
- risk of relapse is 37%, 21%, 6% in thionamides, radioiodine ablation, and surgery groups, respectively

#### Radioiodine Therapy for Graves' Disease and the Effect on Ophthalmopathy – A Systematic Review

*Clin Endocrinol* 2008;69:943-950

**Purpose:** To assess whether radioiodine therapy (RAI) for Graves' disease (GD) is associated with increased risk of ophthalmopathy compared with antithyroid drugs (ATDs) or surgery. To assess the efficacy of glucocorticoid prophylaxis in the prevention of occurrence or progression of Graves' ophthalmopathy (GO), when used with RAI.

**Study Selection:** Randomized controlled trials regardless of language or publication status.

**Results:** RAI was associated with an increased risk of GO compared with ATD (Relative Risk (RR) 4.23, 95% confidence interval (CI): 2.04 to 8.77) but compared with thyroidectomy, there was no statistically significant increased risk (RR 1.59, 95% CI 0.89 to 2.81). The risk of severe GO was also increased with RAI compared with ATD (RR 4.35, 95% CI 1.28 to 14.73). Prednisolone prophylaxis for RAI was highly effective in preventing the progression of GO in patients with pre-existing GO (RR 0.03; 95% CI 0.00 to 0.24). The use of adjunctive ATD with RAI was not associated with any significant benefit on the course of GO.

**Conclusions:** RAI therapy for GD is associated with a small but definite increased risk of development or worsening of GO compared with ATDs. Steroid prophylaxis is beneficial for patients with pre-existing GO.

#### Other Medications Used in the Treatment of Graves'

**Glucocorticoids** have been useful in the treatment of severe Graves' hyperthyroidism and thyroid storm, by inhibiting the conversion of peripheral  $T_4$  to  $T_3$ .

**Lithium** is also used to treat Graves' hyperthyroidism. It acts by blocking thyroid hormone release, but its toxicity has limited its use in practice.

## Subacute Thyroiditis (Thyrototoxic Phase)

### Definition

- acute inflammatory disorder of the thyroid gland characterized by an initial thyrotoxic state followed by hypothyroidism eventually followed by euthyroidism in most cases
- two subtypes: painful and painless

### Etiology and Pathophysiology

- acute inflammation of the thyroid gland characterized by giant cells and lymphocytes
- disruption of thyroid follicles by inflammatory process results in the release of stored hormone rather than excessive production of new thyroid hormone
- painful = viral (usually preceded by URTI), De Quervain's (granulomatous thyroiditis)
- painless = postpartum, auto-immune, lymphocytic
  - occurs in 5-10% of postpartum mothers and is symptomatic in 1/3 of patients

### Clinical Features

- thyroid gland enlargement
- two forms
  - painful ("De Quervain's") thyroid, ears, jaw and occiput
  - painless ("Silent")

- fever and malaise may be present, especially in De Quervain's
- postpartum: thyrotoxicosis 2-3 mo postpartum with a subsequent hypothyroid phase at 4-8 mo postpartum
- may be mistakenly diagnosed as postpartum depression

**Laboratory Investigations**

- initial elevated free  $T_4$ ,  $T_3$ , low TSH, RAIU markedly reduced
- marked elevation of ESR in painful variety only
- as disease progresses values consistent with hypothyroidism may appear
- rise in RAIU reflects gland recovery

**Treatment**

- painful – high dose NSAIDs, prednisone may be required for severe pain, fever, or malaise
- iodinated contrast agents (e.g. iopanoic acid, ipodate) to inhibit peripheral conversion of  $T_4$  to  $T_3$
- $\beta$ -adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms in both subtypes
- if symptomatically hypothyroid, may treat short-term with thyroxine

**Prognosis**

- full recovery in most cases, but permanent hypothyroidism in 10% of painless thyroiditis
- postpartum: most resolve spontaneously without need for supplementation, however may recur with subsequent pregnancies

## Toxic Adenoma/Toxic Multinodular Goitre

**Etiology and Pathophysiology**

- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting  $T_3$  and  $T_4$
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre [Plummer's disease])

**Clinical Features**

- goitre with adenomatous changes
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- atrial fibrillation is a common presentation in the elderly
- seen most frequently in elderly people, often with presentation of atrial fibrillation

**Investigations**

- low TSH, high  $T_3$  and  $T_4$
- thyroid scan with increased uptake in nodule(s) and suppression of the remainder of the gland

**Treatment**

- initiate therapy with PTU or MMI to attain euthyroid state in order to avoid radiation thyroiditis
- use high dose radioactive iodine to ablate tissue over weeks
- $\beta$ -blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

## Thyrotoxic Crisis/Thyroid Storm

**Definition**

- acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism – medical emergency!
- rare, but serious with mortality rate between 20-30%

**Etiology and Pathophysiology**

- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

**Differential Diagnosis**

- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

**Clinical Features**

- hyperthyroidism
- extreme hyperthermia, tachycardia, vomiting, diarrhea, vascular collapse, hepatic failure with jaundice, and confusion
- tachyarrhythmia, congestive heart failure, shock
- mental status changes ranging from delirium to coma

### Laboratory Investigations

- increased free  $T_3$  and  $T_4$ , undetectable TSH
- $\pm$  anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

### Treatment

- principles are the same as in hyperthyroidism except use higher doses and frequencies
- initiate prompt therapy; do not wait for confirmation from lab
- supportive: fluid and electrolytes, diuresis, vasopressors, cooling blanket, and acetaminophen for hyperthermia
- propranolol (IV) for tachycardia and to decrease peripheral conversion of  $T_4$  to  $T_3$  (watch for CHF)
- high dose PTU/MMI
- iodide (NaI, KI, Lugol's solution) to inhibit release of thyroid hormone, given after PTU
- iodinated radiocontrast solutions such as iopanoic acid inhibit both peripheral conversion of  $T_4$  to  $T_3$  and release of thyroid hormone
- lithium to inhibit release of thyroid hormone
- dexamethasone to block peripheral conversion, to lower body temperature, and to treat possible underlying autoimmune condition
- if extreme plasmapheresis or dialysis to remove high circulating thyroid hormone
- treat precipitant

### Prognosis

- probably <20% mortality rate if rapidly recognized and treated

## Hypothyroidism

### Definition

- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

### Epidemiology

- 2-3% of general population
- F:M = 10:1
- 10-20% of women over age 50 have subclinical hypothyroidism (normal  $T_4$ , TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

### Etiology and Pathophysiology

- primary hypothyroidism (90%)
  - inadequate thyroid hormone production secondary to intrinsic thyroid defect
  - iatrogenic: post-ablative ( $^{131}\text{I}$  or surgical thyroidectomy)
  - autoimmune: Hashimoto's thyroiditis, chronic thyroiditis, idiopathic, burnt out Graves'
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4000 births)
  - neoplasia
- secondary hypothyroidism: pituitary hypothyroidism
  - insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
  - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

**Table 19. Interpretation of Serum TSH and Free  $T_4$  in Hypothyroidism**

	Serum TSH	Free $T_4$
Overt Primary Hypothyroidism	Increased	Decreased
Subclinical Primary Hypothyroidism	Increased	Normal
Secondary Hypothyroidism	Decreased or not appropriately elevated	Decreased

#### Thyroid Hormone Replacement for Subclinical Hypothyroidism

*Cochrane DB Syst Rev 2007;3:CD003419*

**Purpose:** To assess the effects of thyroid hormone replacement for subclinical hypothyroidism.

**Study Selection:** RCTs comparing thyroid hormone replacement with placebo in adults with subclinical hypothyroidism. Minimum duration of follow-up was one month.

**Results:** No trial assessed (cardiovascular) mortality or morbidity. Seven studies evaluated symptoms, mood and quality of life with no statistically significant improvement. One study showed a statistically significant improvement in cognitive function. Six studies assessed serum lipids, there was a trend for reduction in some parameters following levothyroxine replacement. Some echocardiographic parameters improved after levothyroxine replacement therapy, like myocardial relaxation. Only four studies reported adverse events with no statistically significant differences between groups.

**Conclusions:** In current RCTs, levothyroxine replacement therapy for subclinical hypothyroidism did not result in improved survival or decreased cardiovascular morbidity. Data on health-related quality of life and symptoms did not demonstrate significant differences between intervention groups. Some evidence indicates that levothyroxine replacement improves some parameters of lipid profiles and left ventricular function.

#### Signs and Symptoms of Hypothyroidism

##### HIS FIRM CAP

Hypoventilation  
Intolerance to cold  
Slow HR  
Fatigue  
Impotence  
Renal impairment  
Menorrhagia/amenorrhea  
Constipation  
Anemia  
Paresthesia

## Clinical Features

**Table 20. Clinical Features of Hypothyroidism**

<b>General</b>	Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroglossia
<b>CVS</b>	Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart
<b>Respiratory</b>	Decreased exercise capacity, hypoventilation secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroglossia
<b>GI</b>	Weight gain despite poor appetite, constipation
<b>Neurology</b>	Paresthesia, slow speech, muscle cramps, delay in relaxation phase of deep tendon reflexes ("hung reflexes"), carpal tunnel syndrome, asymptomatic increase in CK, seizures
<b>GU</b>	Menorrhagia, amenorrhea, impotence
<b>Dermatology</b>	Puffiness of face, periorbital edema, cool and pale, dry and rough skin, hair dry and coarse, eyebrows thinned (lateral 1/3), discolouration (carotenemia)
<b>Hematology</b>	Anemia: 10% pernicious due to presence of anti-parietal cell antibodies with Hashimoto's thyroiditis

### Treatment

- L-thyroxine (dose range: 0.05-0.2 mg PO OD ~1.6 µg/kg/d)
- usually require 1.6 times their weight in kg as the dose in µg/d
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism:
  - need to rule out and/or treat adrenal insufficiency first
  - monitor via measurement of free T<sub>4</sub> (TSH is unreliable in this setting)

### CONGENITAL HYPOTHYROIDISM

- see [Pediatrics](#), P30

## Hashimoto's Thyroiditis

- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from the start
  - associated with thyroid lymphoma

### Etiology and Pathophysiology

- defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na<sup>+</sup>/I symporter

### Risk Factors

- female gender
- genetic susceptibility: increased frequency in patients with Down's syndrome, Turner's syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake
- stress and infection

### Investigations

- high TSH, low T<sub>4</sub> (not necessary to measure T<sub>3</sub> as it will be low as well)
- presence of thyroid peroxidase and thyroglobulin antibodies in serum

### Treatment

- if hypothyroid, replace with L-thyroxine (analog of T<sub>4</sub>)

## Myxedema Coma

### Definition

- severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events – medical emergency!
- rare, but serious mortality when it occurs (up to 60%, despite therapy)

### Clinical Features

- hallmark symptoms of decreased mental status and hypothermia; hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized edema often present

### Investigations

- decreased  $T_4$ , increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

### Treatment

- aggressive treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider  $T_3$  therapy
- supportive measures: mechanical ventilation, fluids, vasopressor drugs, passive rewarming, IV dextrose
- monitor for arrhythmia

## Sick Euthyroid Syndrome (SES)

### Definition

- changes in circulating thyroid hormones amongst patients with serious illness, trauma or stress
- not due to intrinsic thyroid or pituitary disease
- initially low free  $T_3$  may be followed by low TSH and if severe illness low free  $T_4$ . With recovery of illness TSH may overshoot and become transiently high

### Pathophysiology

- abnormalities in SES include alterations in
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
  - thyroid function itself

### Labs

- initially decreased free  $T_3$  followed by decreased TSH and finally decreased free  $T_4$

### Treatment

- treat the underlying disease; thyroid hormone replacement worsens outcomes
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

## Non-Toxic Goitre

### Definition

- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

### Pathophysiology

- the appearance of a goitre is more likely during adolescence, pregnancy, and lactation because of increased thyroid hormone requirements
  - early stages: goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

### Etiology

- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

### Treatment

- remove goitrogens
- radioiodine therapy (need very high doses since non-toxic, used as last resort)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary for severe compressive symptoms

### Complications

- compression of neck structures causing stridor, dysphagia, pain and hoarseness
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

## Thyroid Nodules

### Definition

- clearly defined discrete mass, separated from the thyroid parenchyma
- palpable nodules are found in approximately 5% of the population
- M:F = 1:4

### Etiology

- benign tumours (e.g. colloid nodule, follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

### Investigations

- thyroid ultrasound to determine size and characteristics (cystic vs. solid vs. mixed)
- thyroid function tests (TSH)
- thyroid scan only if TSH is low to determine if nodule is hot (i.e. significant  $^{131}\text{I}$  uptake into nodule) which signifies very low malignant potential
- FNA for all nodules >1-1.5 cm, if not a hot nodule

## Thyroid Malignancies

- see [Otolaryngology](#), OT37

## Adrenal Cortex

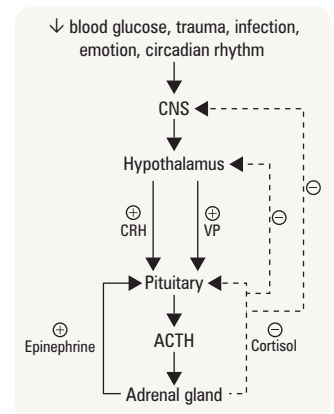

### Adrenocorticotropin Hormone (ACTH)

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400; trough: 1800-2400)
- secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
- stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a limited extent, mineralocorticoids
- some melanocyte stimulating activity

### Adrenocortical Hormones

#### Aldosterone

- a mineralocorticoid which regulates extracellular fluid (ECF) volume through  $\text{Na}^+$  (and  $\text{Cl}^-$ ) retention and  $\text{K}^+$  (and  $\text{H}^+$ ) excretion (stimulates distal tubule  $\text{Na}^+/\text{K}^+$  ATPase)
- regulated by the renin-angiotensin-aldosterone system (Figure 10)
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone  $\rightarrow$  volume expansion) and short loop (angiotensin II  $\rightarrow$  peripheral vasoconstriction)

**Figure 8. Regulation of CRH-ACTH-adrenal gland axis**

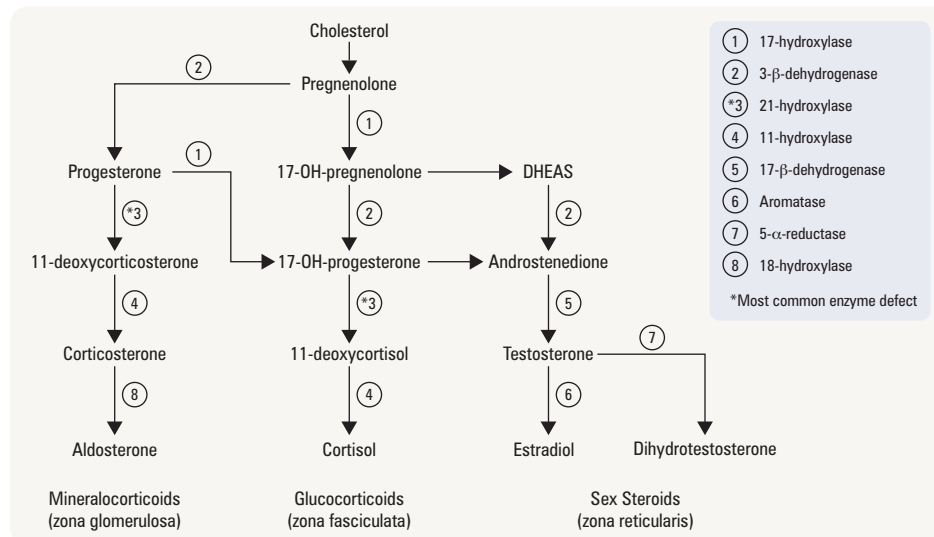

Figure 9. Pathways of major steroid synthesis in the adrenal gland and their enzymes

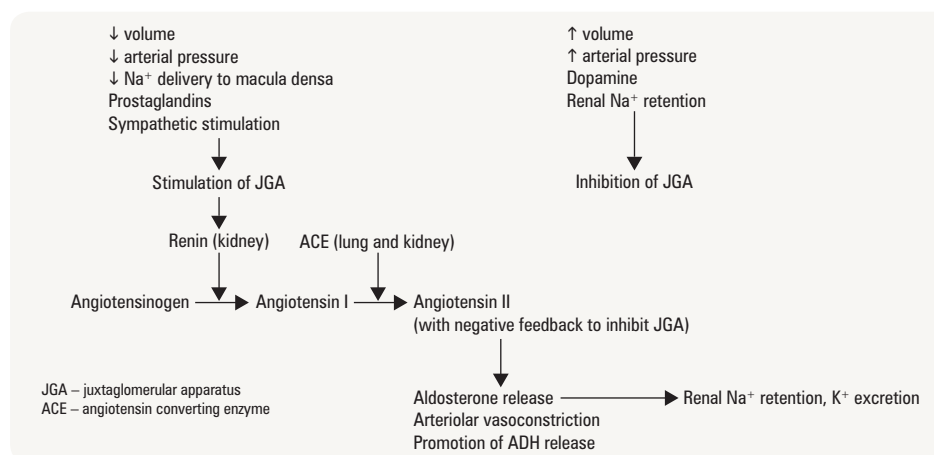

Figure 10. Renin-angiotensin-aldosterone axis (see [Nephrology](#), NP4)

## Cortisol

- a glucocorticoid, regulated by the HPA axis
- involved in regulation of metabolism; counteracts the effects of insulin
- support blood pressure, vasomotor tone
- also involved in regulation of behaviour and immunosuppression

Table 21. Physiological Effects of Glucocorticoids

Stimulatory Effects	Inhibitory Effects
Stimulate hepatic glucose production (gluconeogenesis)	Inhibit bone formation; stimulate bone resorption
Increase insulin resistance in peripheral tissues	Inhibit fibroblasts, causing collagen and connective tissue loss
Increase protein catabolism	Suppress inflammation; impair cell-mediated immunity
Stimulate leukocytosis and lymphopenia	Inhibit growth hormone axis
Increase cardiac output, vascular tone, Na <sup>+</sup> retention	Inhibit reproductive axis
Increase PTH release, urine calcium excretion	Inhibit vitamin D <sub>3</sub> and inhibit calcium uptake

## Androgens

- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are dihydroepiandrosterone (DHEA), androstenedione and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age

## Layers of the Adrenal Cortex

### OUTSIDE

**Zona Glomerulosa** produces mineralocorticoids (aldosterone)

**Zona Fasciculata** produces glucocorticoids (cortisol)

**Zona Reticularis** produces androgens (DHEA, androstenedione)

### INSIDE

## Adrenocortical Functional Work-Up

### STIMULATION TEST

- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

#### 1. Tests of Glucocorticoid Reserve

- Cosyntropin (ACTH analogue) Stimulation Test
  - give 1 µg or 250 µg cosyntropin IV, then measure plasma cortisol levels at time 0, 30, and 60 min
  - physiologic response: stimulated plasma cortisol of >500 nmol/L (>18 µg/dL)
  - inappropriate response: inability to stimulate increased plasma cortisol
- insulin tolerance test used to diagnose secondary or tertiary hypoadrenalism (see *Pituitary Gland*, E16)

#### Principles of Diagnosing Adrenal Disorders:

- Is the suspected hormone ↑ or ↓?
- Can it be suppressed/stimulated?
- Is the stimulating hormone ↑ or ↓? (primary vs. secondary)

### SUPPRESSION TESTS

- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

#### 1. Tests of Pituitary-Adrenal Suppressibility

- Dexamethasone (DXM) Suppression Test
  - principle: DXM suppresses pituitary ACTH → plasma cortisol should be lowered if HPA axis is normal
  - *Screening Test*: Overnight DXM Suppression Test
    - ♦ oral administration of 1 mg DXM at midnight → measure plasma cortisol levels the following day at 8 am
    - ♦ physiologic response: plasma cortisol <50 nmol/L (1.8 µg/dL), with 50-140 nmol/L being a “grey zone” (cannot be certain if normal or not)
    - ♦ inappropriate response: failure to suppress plasma cortisol
    - ♦ <20% false positive results due to obesity, depression, alcohol, other medications
  - *Confirmatory Test*: Other testing is used to confirm the diagnosis, such as:
    - ♦ 24 h urine free cortisol (shows overproduction of cortisol)
    - ♦ midnight salivary cortisol (if available), shows lack of diurnal variation
    - ♦ inappropriate response: remains high (normally will be low at midnight)

#### 2. Tests of Mineralocorticoid Suppressibility

- principle: expansion of extracellular fluid volume (ECFV) → plasma aldosterone should be lowered if HPA axis were normal
- ECFV Expansion with Normal Saline (NS)
  - IV infusion of 500 mL/h of NS for 4 h → then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L (>10 ng/dL) is consistent with primary hyperaldosteronism, <140 pmol/L (<5 ng/dL) is normal
  - inappropriate response: failure to suppress plasma aldosterone

Mineralocorticoid Excess Syndromes

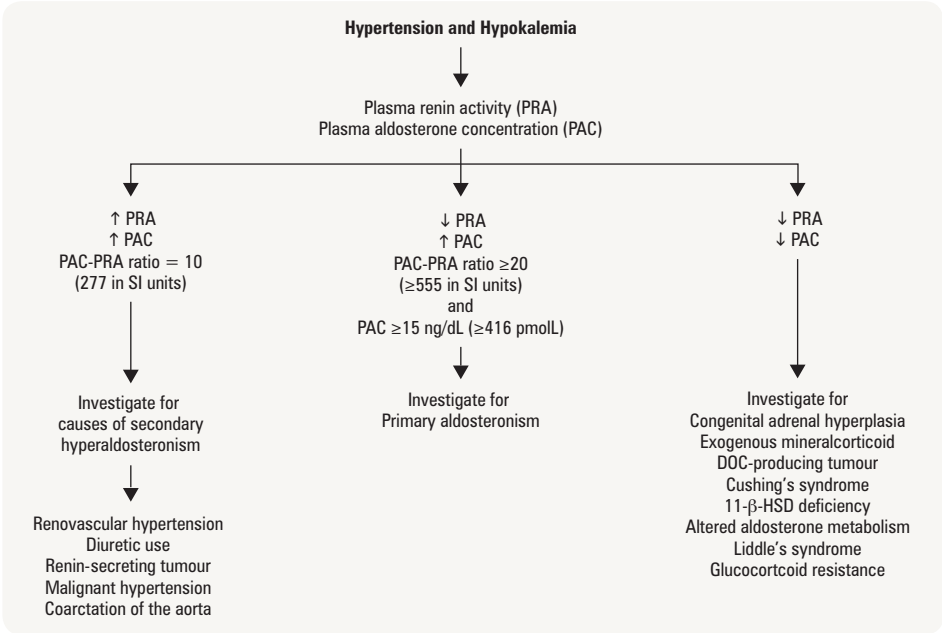

Figure 11. Approach to mineralocorticoid excess syndromes

Definition

- primary hyperaldosteronism (PH): excess aldosterone production (intra-adrenal cause)
- secondary hyperaldosteronism: aldosterone production in response to excess RAAS (extra-adrenal cause)

Etiology

- primary hyperaldosteronism
  - aldosterone-producing adrenal adenoma (Conn's syndrome)
  - bilateral or idiopathic adrenal hyperplasia
  - glucocorticoid-remediable aldosteronism)
  - aldosterone-producing adrenocortical carcinoma
  - unilateral adrenal hyperplasia
- secondary hyperaldosteronism (see Figure 11)

Clinical Features

- hypertension
- hypokalemia (may have mild hypernatremia), metabolic alkalosis
- normal K<sup>+</sup>, low Na<sup>+</sup> in SH (low effective circulating volume leads to ↑ ADH release) → edema
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, MI
- fatigue, weakness, paresthesia, headache; severe cases with tetany, intermittent paralysis

Diagnosis

- investigate plasma aldosterone to renin ratio in patients with hypertension and hypokalemia
- confirmatory testing for PH: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECFV expansion)
- imaging: CT adrenal glands

Table 22. Diagnostic Tests in Hyperaldosteronism

Test	Primary Hyperaldosteronism	Secondary Hyperaldosteronism
Plasma aldosterone to renin ratio (PAC/PRA)	Elevated (↑ aldo, ↓ renin)	Normal (↑ aldo, ↓ renin)
Salt loading test:		Not performed if normal PAC/PRA
A) Oral test:	↑ urine aldosterone	
B) IV saline test:	↑ plasma aldosterone	

Treatment

- inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause

## Cushing's Syndrome

### Definition

- results from chronic glucocorticoid excess (endogenous or exogenous sources)

### Etiology

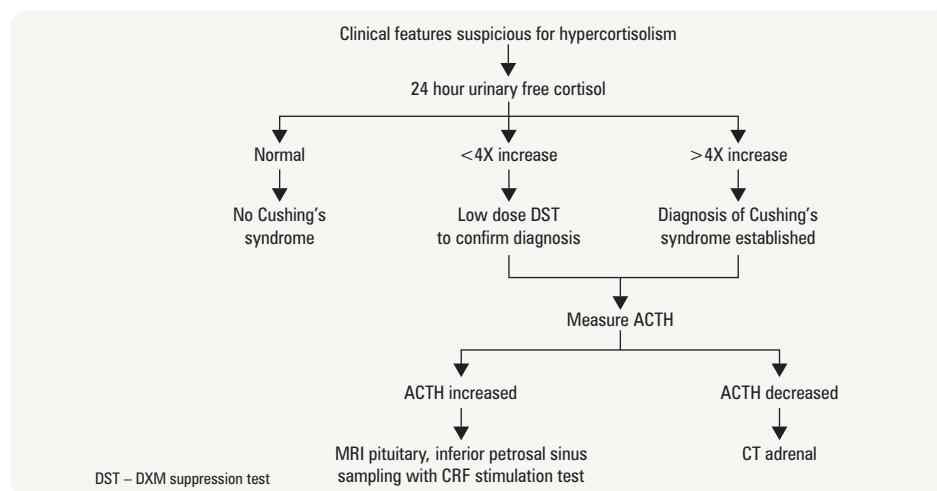

- ACTH-dependent (85%) – bilateral adrenal hyperplasia and hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing's disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma or medullary thyroid tumours)
- ACTH-independent (15%)
  - long-term use of exogenous glucocorticoids
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia

### Clinical Features

- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism and acne (ACTH dependent)
- signs: central obesity, round face, supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, hypertension, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism if ACTH-dependent

**Figure 12. Clinical features of Cushing's syndrome**

**Figure 13. Hypercortisolism: algorithm for diagnosis**

### Treatment

- adrenal
  - adenoma: unilateral adrenalectomy (curative)
  - carcinoma: adjunctive chemotherapy often not useful (frequent metastases, poor prognosis)
  - medical treatment: mitotane, ketoconazole to reduce cortisol
- pituitary
  - trans-sphenoidal resection, with glucocorticoid supplement post-operatively
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis)
  - surgical resection, if possible; chemotherapy/radiation for primary tumour
  - agents blocking adrenal steroid synthesis: metyrapone or ketoconazole

## Congenital Adrenal Hyperplasia

- see [Pediatrics](#), P31

## Hyperandrogenism

### Definition

- state of having excessive secretion of androgens (DHEA, DHEA sulfate, testosterone)

### Etiology and Pathophysiology

**Table 23. Etiology of Hyperandrogenism**

<b>Constitutional/Familial</b>	Family history, predisposing ethnic background Premature adrenarche
<b>Medications Androgen-mediated</b>	Anabolic steroids, ACTH, androgens, progestational agents
<b>Ovarian</b>	PCOS Ovarian hyperthecosis Theca cell tumours Pregnancy: placental sulfatase/aromatase deficiency
<b>Adrenal</b>	Congenital adrenal hyperplasia (CAH, late-onset CAH) Tumours (adenoma, carcinoma)
<b>Pituitary</b>	Cushing's disease – high ACTH Hyperprolactinemia

### Clinical Features

#### Females:

- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism
- virilization
  - masculinization: hirsutism, temporal balding, clitoral enlargement, deepening of voice, acne
  - increase in musculature
- defeminization
  - loss of female secondary sex characteristics (i.e. amenorrhea, ↓ breast size, infertility)

#### Males:

- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production and spermatogenesis

### Investigations

- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose, lipids, 75 g OGTT

### Treatment

- discontinue causative medications
  - antiandrogens, e.g. spironolactone
- oral contraceptives (e.g. cyproterone acetate – blocks androgen receptor; found in Diane 35®)
- surgical resection of tumour
- low dose glucocorticoid ± mineralocorticoid if CAH suspected
- treat specific causative disorders, e.g. tumours, Cushing's, etc.
- cosmetic therapy (laser, electrolysis)

#### Conditions that do NOT Represent True Hirsutism

- Androgen-independent hair (e.g. lanugo hair)
- Drug-induced hypertrichosis (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- Topical steroid use

## Adrenocortical Insufficiency

### Definition

- a state of inadequate cortisol and aldosterone production by the adrenal glands

### Etiology

#### PRIMARY (ADDISON'S DISEASE)

**Table 24. Etiology of Primary Adrenocortical Insufficiency**

<b>Autoimmune (70-90%)</b>	Isolated adrenal insufficiency Polyglandular autoimmune syndrome type I and II Antibodies often directed against adrenal enzymes and 3 cortical zones
<b>Infection</b>	TB (7-20%) (most common in developing world) Fungal: histoplasmosis, paracoccidioidomycosis HIV, CMV Syphilis African trypanosomiasis
<b>Infiltrative</b>	Metastatic cancer (lung>stomach>esophagus>colon>breast); lymphoma Sarcoidosis, amyloidosis, hemochromatosis
<b>Vascular</b>	Bilateral adrenal hemorrhage Sepsis (meningococcal, <i>Pseudomonas</i> ) Coagulopathy in adults or Waterhouse-Friderichsen syndrome in children Thrombosis, embolism, adrenal infarction
<b>Drugs</b>	Inhibit cortisol: ketoconazole, megestrol acetate Increase cortisol metabolism: rifampin, phenytoin, barbiturates, heparin, coumadin
<b>Others</b>	Adrenoleukodystrophy Congenital adrenal hypoplasia (impaired steroidogenesis) Familial glucocorticoid deficiency or resistance

#### SECONDARY ADRENOCORTICAL INSUFFICIENCY

- inadequate pituitary ACTH secretion
- multiple etiologies (see *Hypopituitarism*, E20), including withdrawal of exogenous steroids

### Clinical Features

**Table 25. Clinical Features of Primary and Secondary Adrenal Insufficiency (AI)**

	<b>Primary AI (Addison's or Acute AI)</b>	<b>Secondary AI</b>
<b>Skin and mucosa</b>	Dark (palmar crease, extensor surface)	Pale
<b>Potassium</b>	High	Normal
<b>Sodium</b>	Low	Normal or Low
<b>Metabolic acidosis</b>	Present	Absent
<b>Associated diseases</b>	Primary hypothyroidism, Type 1 DM, vitiligo, neurological deficits	Central hypogonadism or hypothyroidism, growth hormone deficiency, diabetes insipidus, headaches, visual abnormalities
<b>Associated symptoms</b>	Weakness, fatigue, weight loss, hypotension, salt craving, postural dizziness, myalgia, arthralgia GI: nausea, vomiting, abdominal pain, diarrhea	Same except: NO salt craving GI less common
<b>Diagnostic test</b>	Cosyntropin Stimulation Test High morning plasma ACTH	Insulin tolerance test Cosyntropin Stimulation Test Low morning plasma ACTH

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

### Treatment

- acute condition – can be life-threatening
  - IV NS in large volumes (2-3 L); add D5W if hypoglycemic from adrenal insufficiency
  - hydrocortisone 50-100 mg IV q6-8h for 24h, then gradual tapering
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-20 mg total daily dose, in 2-3 divided doses, highest dose in the AM
  - Florinef® (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
  - major stress (e.g. surgery, trauma) requires 150-300 hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

## Adrenal Medulla

### Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

#### ABC of Adrenaline

Adrenaline activates  $\beta$ -receptors, increasing Cyclic AMP

### Pheochromocytoma

#### Definition

- rare catecholamine secreting tumour derived from chromaffin cells of the sympathetic system

#### Epidemiology

- most commonly a single tumour of adrenal medulla
- rare cause of hypertension (<0.2% of all hypertensives)

#### Etiology and Pathophysiology

- most cases sporadic (80%)
- familial: associated with multiple endocrine neoplasia II (MEN IIA and IIB) (50% penetrance; i.e. 50% of people with the mutation get pheochromocytoma), von Hippel-Lindau (10-20% penetrance), paraganglioma (20% penetrance), or neurofibromatosis type 1 (0.1-5.7% penetrance)
- tumours, via unknown mechanism, able to synthesize and release excessive catecholamines

#### Clinical Features

- 50% suffer from paroxysmal HTN; the rest have sustained HTN
- classic triad: episodic "pounding" headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, nausea/vomiting, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods)

#### Investigations

- urine catecholamines
  - increased catecholamine metabolites (metanephrines) and free catecholamines
  - plasma metanephrines if available (most sensitive)
    - cut-off values will depend on assay used
- CT abdomen
  - if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

#### Treatment

- surgical removal of tumour (curative) with careful pre- and post-operative ICU monitoring
- adequate pre-operative preparation
  - $\alpha$ -blockade for BP control: phenoxybenzamine (10-21 d pre-operative), IV phentolamine (peri-operative, if required)
  - $\beta$ -blockade for HR control once  $\alpha$  blocked for a few days
  - metyrosine (catecholamine synthesis inhibitor) + phenoxybenzamine or prazosin
  - volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo post-operatively
- screen urine in first degree relatives; genetic testing in patients <50 yr old

#### Pheochromocytomas 'Rule of 10s'

10% extra-adrenal  
10% bilateral  
10% malignant  
10% familial

#### Classic Triad of PHEochromocytoma

Palpitations  
Headache  
Episodic sweating

## Disorders of Multiple Endocrine Glands

### Multiple Endocrine Neoplasm (MEN)

- neoplastic syndromes involving multiple endocrine glands
- tumours of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance
- genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN II
  - early cure and prevention of medullary thyroid cancer

**Table 26. MEN Classification**

Type	Tissues Involved	Clinical Manifestations
<b>MEN I (chromosome 11)</b>		
<b>Wermer's Syndrome</b>	Pituitary Ant. pituitary adenoma	Headache, visual field defects. Often non-secreting but may secrete GH (acromegaly) and PRL (galactorrhea, erectile dysfunction, decreased libido, amenorrhea)
	Parathyroid Primary hyperparathyroidism from hyperplasia	Nephrolithiasis, bone abnormalities, MSK complaints, symptoms of hypercalcemia
	Entero-pancreatic endocrine Pancreatic islet cell tumours	Epigastric pain (peptic ulcers and esophagitis)
	Gastrinoma	Hypoglycemia
	Insulinomas	Secretory diarrhea
	Vasoactive intestinal peptide (VIP)-omas	
	Glucagonoma	Rash, anorexia, anemia, diarrhea, glossitis
	Carcinoid syndrome	Flushing, diarrhea, bronchospasm
<b>MEN II (chromosome 10)</b>		
<b>1. IIa Sipple's Syndrome</b>	Thyroid (>90%) Medullary thyroid cancer (MTC)	Physical signs are variable and often subtle
	Adrenal medulla (40-50%) Pheochromocytoma	Neck mass or thyroid nodule; non-tender, anterior lymph nodes HTN, palpitations, headache, sweating
	Parathyroid (10-20%) 1° parathyroid hyperplasia	Symptoms of hypercalcemia
	Skin Cutaneous lichen amyloidosis	Scaly skin rash
<b>2. Familial Medullary Thyroid Ca (a variant of IIa)</b>	Thyroid MTC	MTC without other clinical manifestations of MEN IIa or IIb
<b>3. IIb</b>	Thyroid MTC	MTC: most common component, more aggressive and earlier onset than MEN IIa
	Adrenal medulla Pheochromocytoma	HTN, palpitations, headache, sweating
	Neurons Mucosal neuroma, intestinal ganglioneuromas	Chronic constipation; megacolon
	MSK	Marfanoid habitus (no aortic abnormalities)

**MEN I – Wermer's Syndrome Affects the 3 Ps**

Pituitary  
Parathyroid  
Pancreas

## Investigations

- MEN I
  - laboratory
    - ♦ may consider genetic screening for MEN-1 mutation in index patients
      - if a mutation is identified, screen family members who are at risk
    - ♦ gastrinoma: elevated serum gastrin level (>200 ng/mL) after IV injection of secretin
    - ♦ insulinoma: reduced fasting blood glucose (hypoglycemia) with elevated insulin and C-peptide levels
    - ♦ glucagonoma: elevated blood glucose and glucagon levels
    - ♦ pituitary tumours: assess GH, IGF-1 and prolactin levels (for over-production), TSH, free T<sub>4</sub>, 8 AM cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
    - ♦ hyperparathyroidism: serum Ca<sup>2+</sup> and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - ♦ MRI for pituitary tumours, gastrinoma, insulinoma
- MEN II
  - laboratory
    - ♦ genetic screening for RET mutations in all index patients
      - if a mutation is identified screen family members who are at risk
    - ♦ calcitonin levels (MTC); urine catecholamines and metanephrines (pheochromocytoma); serum Ca<sup>2+</sup>, albumin and PTH levels (hyperparathyroidism)
    - ♦ pentagastrin ± calcium stimulation test if calcitonin level is within reference range
    - ♦ FNA for thyroid nodules → cytology
  - imaging
    - ♦ CT or MRI of adrenal glands, metaiodobenzylguanidine (MIBG) scan for pheochromocytoma
    - ♦ octreoscan and/or radionuclide scanning for determining the extent of metastasis

## Treatment

- MEN I
  - medical
    - ♦ proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
    - ♦ cabergoline or other dopamine agonists to suppress prolactin secretion
    - ♦ somatostatin for symptomatic carcinoid tumours

- surgery for hyperparathyroidism, insulinoma, glucagonoma, pituitary tumours (if medical treatment fails for the latter)
  - ♦ trans-sphenoidal approach with prn external radiation
- MEN II
  - surgery for MEN IIa with pre-operative medical therapy:
    - ♦ prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
    - ♦  $\alpha$ -blocker for at least 10-21 d for pheochromocytoma pre-op
    - ♦ hydration, calcitonin, IV bisphosphonates for hypercalcemia

## Calcium Homeostasis

- normal total serum  $\text{Ca}^{2+}$ : 2.2-2.6 mmol/L (8.5-10.5 mg/dL)
- ionic/free  $\text{Ca}^{2+}$  levels: 1.15-1.31 mmol/L (4.6-5.25 mg/dL)
- serum  $\text{Ca}^{2+}$  is about 50% protein bound (mostly albumin)
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D
- actions mainly on three organs: GI tract, bone, and kidney

**Table 27. Major Regulators in Calcium Homeostasis**

Major Regulators	Source	Regulation	Net Effect
PTH	Parathyroid glands	Stimulated by low serum $\text{Ca}^{2+}$ and high serum $\text{PO}_4^{3-}$ ; inhibited by chronic low serum $\text{Mg}^{2+}$ , high serum $\text{Ca}^{2+}$ , and calcitriol	$\uparrow \text{Ca}^{2+}$ $\uparrow \text{Calcitriol}$ $\downarrow \text{PO}_4^{3-}$
Calcitriol (1,25-(OH) $_2\text{D}_3$ )	Dietary intake Synthesized from cholesterol: UV on skin makes cholecalciferol (VitD $_3$ ) $\rightarrow$ liver makes calcidiol (25-(OH)D $_3$ ) $\rightarrow$ kidneys make calcitriol	Renal calcitriol production is stimulated by low serum $\text{PO}_4^{3-}$ and PTH; inhibited by high serum $\text{PO}_4^{3-}$ and calcitriol in negative feedback	$\uparrow \text{Ca}^{2+}$ $\uparrow \text{PO}_4^{3-}$
Calcitonin	Thyroid C cells	Stimulated by pentagastrin (GI hormone) and high serum $\text{Ca}^{2+}$ ; inhibited by low serum $\text{Ca}^{2+}$	$\downarrow \text{Ca}^{2+}$ (in pharmacologic doses) $\downarrow \text{PO}_4^{3-}$
$\text{Mg}^{2+}$	Major intracellular divalent cation	See section on <i>Magnesium</i> (E42)	Cofactor for PTH secretion
$\text{PO}_4^{3-}$	Intracellular anion found in all tissues	See section on <i>Phosphate</i> (E41)	$\downarrow \text{Ca}^{2+}$

**Pseudohypercalcemia:** increased protein binding leading to an elevation in serum total  $\text{Ca}^{2+}$  without a rise in the ionized/free form, e.g. hyperalbuminemia from severe dehydration.

**Primary Hyperparathyroidism:** Increased PTH secretion commonly due to parathyroid adenoma, lithium therapy; less often parathyroid carcinoma or parathyroid hyperplasia

**Secondary Hyperparathyroidism:** Partial resistance to PTH action leads to parathyroid gland hyperplasia and increased PTH secretion, often in patients with renal failure and osteomalacia. Due to low or low normal serum calcium levels

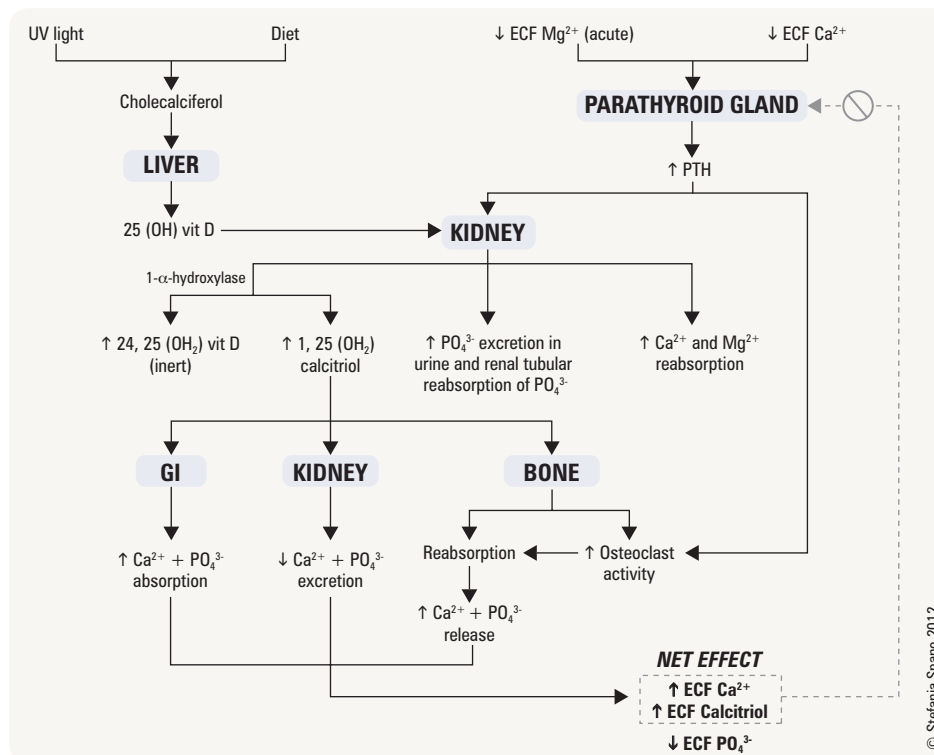

**Tertiary Hyperparathyroidism:** Irreversible clonal outgrowth of parathyroid glands, usually in long-standing inadequately treated chronic renal failure on dialysis

**Primary Hyperparathyroidism** is the most common cause of hypercalcemia in healthy outpatients. Most commonly related to a solitary adenoma or less commonly multiple gland hyperplasia. Surgical excision acts as a definitive treatment and is recommended for patients who are symptomatic. For mild asymptomatic disease medial surveillance may be appropriate with annual serum calcium, creatinine, and BMD.

**For asymptomatic patients surgery is recommended for those who meet  $\geq 1$  of the following criteria:**

- Serum calcium concentration more than 0.25 mmol/L (1.0 mg/dL) above the upper limit of normal
- Creatinine clearance  $< 60$  mL/min
- BMD T-score  $< -2.5$  at hip, spine, or distal radius, and/or previous fragility fracture
- Age  $< 50$  yr

© Stefania Spano 2012

**Figure 14. Parathyroid hormone (PTH) regulation**

## Hypercalcemia

### Definition

- total corrected serum  $\text{Ca}^{2+} > 2.6 \text{ mmol/L}$  (10.5 mg/dL) OR ionized  $\text{Ca}^{2+} > 1.35 \text{ mmol/L}$  (5.4 mg/dL)

### Approach to Hypercalcemia (Figure 15)

1. Is the patient hypercalcemic? (correct for albumin – see sidebar)
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low? If phosphate is high/normal is the level of vitamin D metabolites high or low?

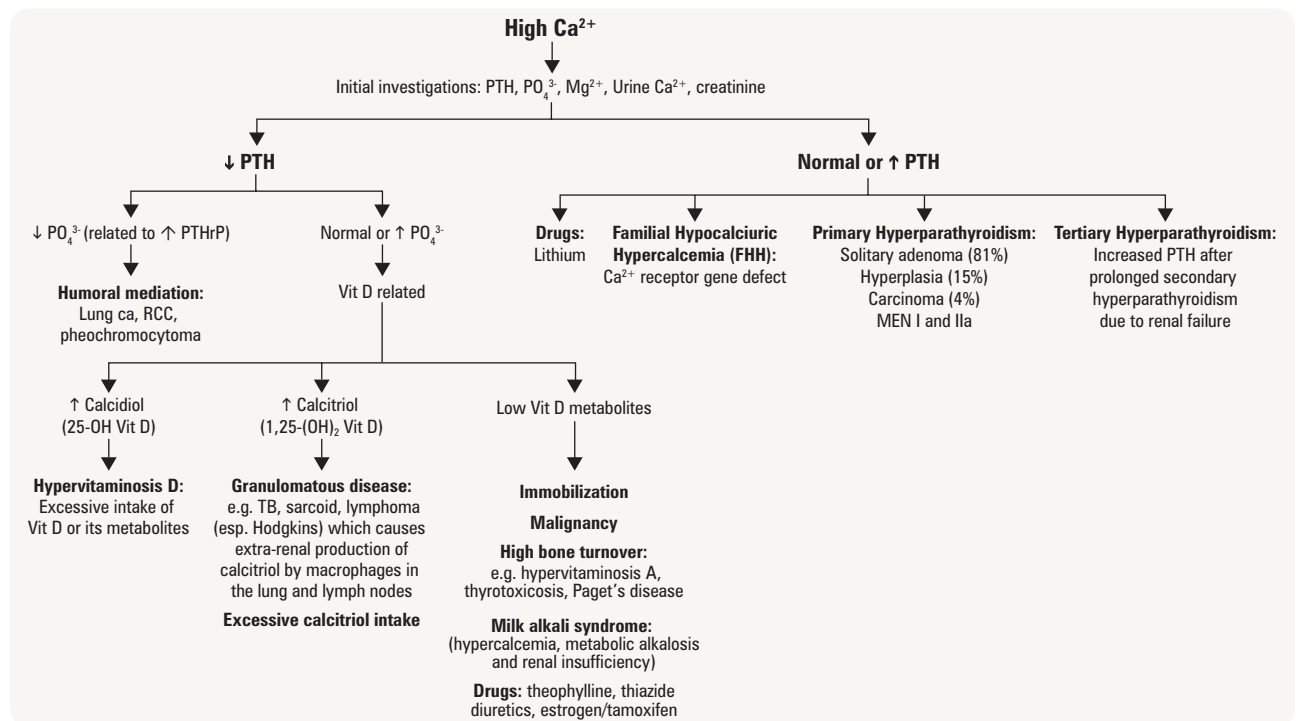

Figure 15. Differential diagnosis of hypercalcemia

### Clinical Features

- symptoms depend on the absolute  $\text{Ca}^{2+}$  value and the rate of its rise (may be asymptomatic)

Table 28. Symptoms of Hypercalcemia

Cardiovascular	GI	Renal	Rheumatological	MSK	Psychiatric	Neurologic
Hypertension Arrhythmia Short QT Deposition of $\text{Ca}^{2+}$ on valves, coronary arteries, myocardial fibres	Constipation Anorexia Nausea Vomiting (groans) PUD pancreatitis	Polyuria (Nephrogenic DI) Polydipsia Nephrolithiasis (stones) Renal failure (irreversible)	Gout Pseudogout Chondrocalcinosis	Weakness Bone pain (bones)	$> 3 \text{ mmol/L}$ (12 mg/dL) Increased alertness Anxiety Depression Cognitive dysfunction Organic brain syndromes $> 4 \text{ mmol/L}$ (16 mg/dL) Psychosis (moans)	Hypotonia Hyporeflexia Myopathy Paresis

**\*\* Hypercalcemic crisis (usually  $> 4 \text{ mmol/L}$  or  $16 \text{ mg/dL}$ ):** primary symptoms include oliguria/anuria and mental status changes (including somnolence and eventually coma) → this is a medical emergency and should be treated immediately!

### Treatment

- treatment depends on the  $\text{Ca}^{2+}$  level and the symptoms
- treat acute, symptomatic hypercalcemia aggressively

Corrected  $\text{Ca}^{2+}$  (mmol/L) = measured  $\text{Ca}^{2+} + 0.02 (40 - \text{albumin})$

For every decrease in albumin by 10, increase in  $\text{Ca}^{2+}$  by 0.2

Benign (less likely malignant):  
 $\text{Ca}^{2+} < 2.75 \text{ mmol/L}$  (11 mg/dL)

Pathologic (more likely malignant):  
 $\text{Ca}^{2+} > 3.25 \text{ mmol/L}$  (13 mg/dL)

The symptoms and signs of hypercalcemia include:  
"Bones, stones, groans and psychic overtones"

The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia

- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian and squamous tumours, as well as lymphoma and multiple myeloma

#### Mechanisms:

- Secretion of parathyroid hormone-related protein (PTHrP) which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma (1-hydroxylates 25, OH-vitamin D)
- Osteolytic bone metastases direct effect
- Excess PTH in Parathyroid CA

**Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis**

<b>Increase Urinary <math>\text{Ca}^{2+}</math> Excretion</b>	Isotonic saline (4-5 L) over 24 h $\pm$ loop diuretic (e.g. furosemide) but only if hypervolemic Calcitonin: <ul style="list-style-type: none"> <li>• 4 IU/kg IM/SC q12h</li> <li>• 8 IU/kg IM/SC q6h</li> <li>• Only works for 48 h</li> <li>• Rapid onset within 4-6 h</li> </ul>
<b>Diminish Bone Resorption</b>	Bisphosphonates (Tx of choice) <ul style="list-style-type: none"> <li>• Inhibits osteoclastic bone resorption and promotes renal excretion of calcium</li> <li>• Acts rapidly but often transient response (decreased by 0.3-0.5 mmol/L (1.2-2.0 mg/dL) beginning within 4-6 h) max effect usually in 7 d</li> <li>• Combination of calcitonin and steroids may prolong reduction in calcium</li> <li>• Tachyphylaxis may occur</li> <li>• Indicated in malignancy-related hypercalcemia (IV pamidronate is most commonly used, zoledronic acid also now used in CA patient)</li> </ul> Mithramycin (rarely used) – effective when patient cannot tolerate large fluid load <ul style="list-style-type: none"> <li>• Dangerous – hematotoxic and hepatotoxic</li> </ul>
<b>Decrease GI <math>\text{Ca}^{2+}</math> Absorption</b>	Corticosteroids in hypervitaminosis D and hematologic malignancies <ul style="list-style-type: none"> <li>• Anti-tumour effects <math>\rightarrow</math> decreased calcitriol production by the activated mononuclear cells in lung and lymph node</li> <li>• Slow to act (5-10 d); need high dose</li> </ul>
<b>Dialysis</b>	Treatment of last resort <ul style="list-style-type: none"> <li>• Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure</li> </ul>

**Differential Diagnosis of Hypercalcemia**

- **Primary hyperparathyroidism**
- **Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)**
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk-alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, TB, Hodgkin's lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

**Watch Out For:**

- Volume depletion via diuresis
- Arrhythmias

**Acute Management of Hypercalcemia/Hypercalcemic Crisis**

- Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
- Calcitonin: transient, partial response
- Bisphosphonate: treatment of choice
- Corticosteroid: most useful in Vit D toxicity, granulomatous disease, some malignancies
- Saline diuresis + loop diuretic (for volume overload): temporary measure

Hypomagnesemia can impair PTH secretion and action.

**Differential Diagnosis of Tetany**

- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

**Signs and Symptoms of Acute Hypocalcemia**

- **Paresthesias:** perioral, hands and feet
- **Chvostek's sign:** percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
- **Trousseau's sign:** inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

## Hypocalcemia

**Definition**

- total corrected serum  $\text{Ca}^{2+}$  <2.2 mmol/L (8.5 mg/dL)

**Table 30. Clinical Features of Hypocalcemia**

Acute Hypocalcemia	Chronic Hypocalcemia
Paresthesia	CNS: lethargy, seizures, psychosis, basal ganglia calcification, Parkinson's, dystonia, hemiballismus, papilledema, pseudotumour cerebri
Laryngospasm (with stridor)	CVS: prolonged QT interval $\rightarrow$ Torsades de pointes (ventricular tachycardia)
Hyperreflexia	GI: steatorrhea
Tetany	ENDO: impaired insulin release
Chvostek's sign (tap CN VII)	SKIN: dry, scaling, alopecia, brittle and transversely fissured nails, candidiasis, abnormal dentition
Trousseau's sign (carpal spasm)	OCULAR: cataracts
ECG changes	MSK: generalized muscle weakness and wasting
Delirium	
Psychiatric Sx: emotional instability, anxiety and depression	

**Approach to Hypocalcemia (Figure 16)**

1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the  $\text{Mg}^{2+}$  level low?

**Approach to Treatment**

- correct underlying disorder
- mild/asymptomatic (ionized  $\text{Ca}^{2+}$  >0.8 mmol/L, 3.2 mg/dL)
  - treat by increasing dietary  $\text{Ca}^{2+}$  by 1000 mg/d
  - calcitriol 0.25  $\mu\text{g}/\text{d}$
- acute/symptomatic hypocalcemia (ionized  $\text{Ca}^{2+}$  <0.7 mmol/L, 2.8 mg/dL)
  - immediate treatment required
  - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion if necessary
  - goal is to raise  $\text{Ca}^{2+}$  to low normal range (2.0-2.1 mmol/L, 8.0-8.4 mg/dL) to prevent symptoms but allow maximum stimulation of PTH secretion
- if PTH recovery not expected, requires long-term therapy with calcitriol and calcium
- **do not correct hypocalcemia if asymptomatic and suspected to be transient**

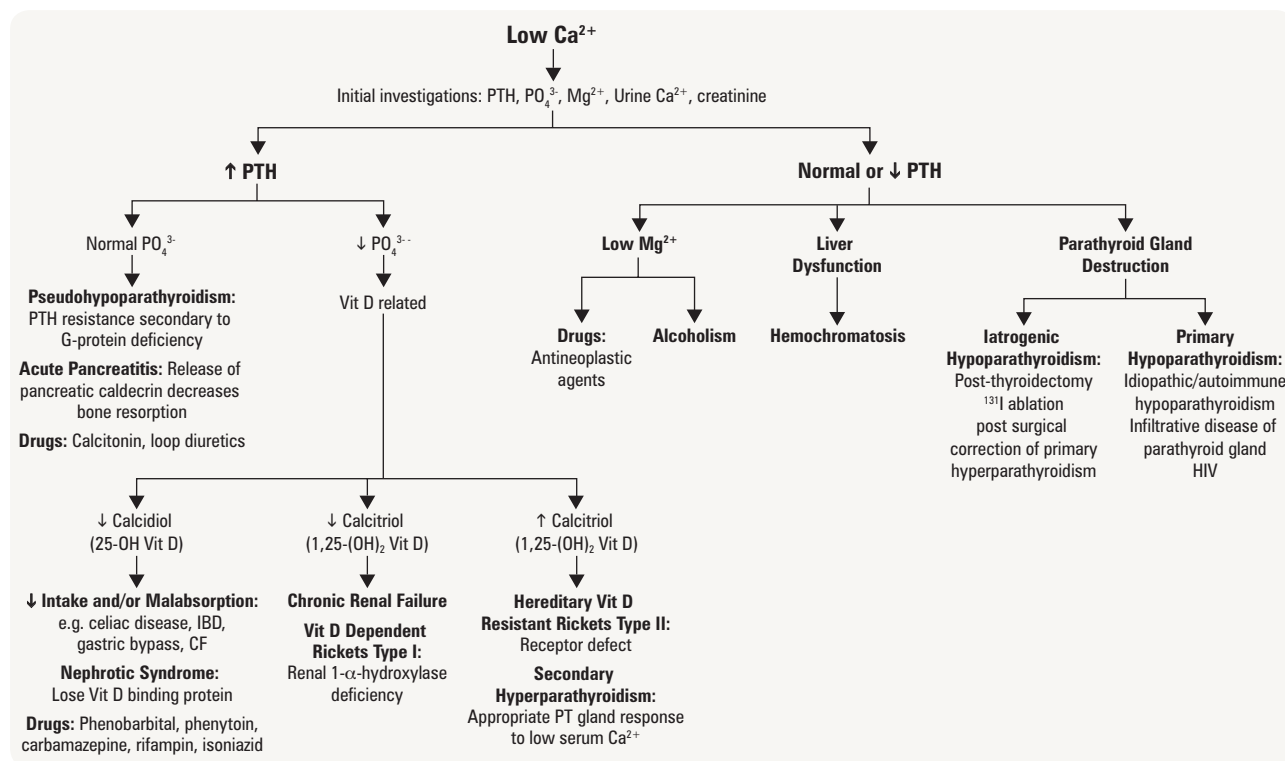

Figure 16. Etiology and clinical approach to hypocalcemia

## Hyperphosphatemia

### Definition

- serum phosphate  $>1.45$  mmol/L (4.1 mg/dL)

Table 31. Etiology of Hyperphosphatemia

Increased Phosphate Load	Reduced Renal Clearance	Pseudohyperphosphatemia
GI intake (rectal enema, GI bleeding) IV phosphate load (K-Phos®, blood transfusion) Endogenous phosphate (tumour lysis syndrome, rhabdomyolysis, hemolysis, lactic and ketoacidosis)	Acute/chronic renal failure Hypoparathyroidism Acromegaly Tumour calcinosis (ability of kidney to specifically clear phosphate is defective)	Hyperglobulinemia Hyperlipidemia Hyperbilirubinemia

### Clinical Features

- non-specific, include ectopic calcification, renal osteodystrophy

### Treatment

- acute: hemodialysis if symptomatic
- chronic: low  $\text{PO}_4^{3-}$  diet, phosphate binders (e.g.  $\text{CaCO}_3$ )

## Hypophosphatemia

### Definition

- serum phosphate  $<0.85$  mmol/L (2.4 mg/dL)

Table 32. Etiology of Hypophosphatemia

Inadequate Intake	Renal Losses	Excessive Skeletal Mineralization	Shift into ICF
Starvation Malabsorption (diarrhea, steatorrhea) Antacid use Alcoholism	Hyperparathyroidism Diuretics X-linked or AD hypophosphatemic rickets Fanconi syndrome Multiple myeloma	Osteoblastic metastases Post parathyroidectomy (referred to as 'hungry bone syndrome')	Recovery from metabolic acidosis Respiratory alkalosis Starvation refeeding (stimulated by insulin)

Symptoms usually present when phosphate  $<0.32$  mmol/L (1.0 mg/dL)  
Treat asymptomatic patients if phosphate  $<0.64$  mmol/L (2.0 mg/dL)

**Clinical Features**

- non-specific (CHF, coma, hypotension, weakness, defective clotting)

**Treatment**

- treat underlying cause
  - Oral  $\text{PO}_4^{3-}$ : 2-4 g/d divided bid-qid (start at 1 g/d to minimize diarrhea)
  - IV  $\text{PO}_4^{3-}$ : only for severely symptomatic patients or inability to tolerate oral therapy

**Hypermagnesemia****Definition**

- serum magnesium  $>0.85$  mmol/L (2.1 mg/dL)

**Etiology**

- AKI/CRF
- $\text{Mg}^{2+}$ -containing antacids or enemas
- IV administration of large doses of  $\text{MgSO}_4$  (e.g. for preeclampsia; see [Obstetrics](#), OB16)

**Clinical Features**

- drowsiness, hyporeflexia, respiratory depression, heart block, cardiac arrest

**Treatment**

- discontinue  $\text{Mg}^{2+}$ -containing products
- IV calcium ( $\text{Mg}^{2+}$ -antagonist) for acute reversal of magnesium toxicity
- dialysis if renal failure

**Hypomagnesemia****Definition**

- serum magnesium  $<0.70$  mmol/L (1.7 mg/dL)

**Etiology**

- GI losses
  - starvation/malabsorption
  - vomiting/diarrhea
  - alcoholism
  - acute pancreatitis
- excess renal loss
  - $2^\circ$  hyperaldosteronism due to cirrhosis and CHF
  - hyperglycemia
  - hypokalemia
  - hypercalcemia
  - loop and thiazide-type diuretics
  - nephrotoxic medications
  - proton-pump inhibitors

**Clinical Features**

- seizures, paresis, Chvostek and Trousseau signs, ECG changes (widened QRS, prolonged PR, T-wave abnormalities) and arrhythmias including Torsades de pointes

**Treatment**

- treat underlying cause
- $\text{Mg}^{2+}$  IM/IV; cellular uptake of  $\text{Mg}^{2+}$  is slow, therefore repletion requires sustained correction
- discontinue diuretics
  - in patients requiring diuretics, use a  $\text{K}^+$ -sparing diuretic to minimize magnesuria

You will be unable to correct hypokalemia or hypocalcemia without first supplementing magnesium if patient hypomagnesemic.

**Metabolic Bone Disease****Osteoporosis****Definition**

- a condition characterized by decreased bone mass and microarchitectural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility to fracture
- bone mineral density (BMD)  $\geq 2.5$  standard deviations below the peak bone mass for young adults (i.e. T-score  $\leq -2.5$ )
- osteopenia: BMD with T-score between -1.0 and -2.5

**ETIOLOGY AND PATHOPHYSIOLOGY****Primary Osteoporosis**

- primary type 1: most common in post-menopausal women, due to decline in estrogen, worsens with age
- primary type 2: occurs after age 75, seen in females and males at 2:1 ratio, possibly due to zinc deficiency

## Secondary Osteoporosis

- gastrointestinal diseases
  - gastrectomy
  - malabsorption (e.g. celiac disease)
  - chronic liver disease
- bone marrow disorders
  - multiple myeloma
  - lymphoma
  - leukemia
- endocrinopathies
  - Cushing's syndrome
  - hyperparathyroidism
  - hyperthyroidism
  - premature menopause
  - diabetes
- malignancy
  - secondary to chemotherapy
  - myeloma
- drugs
  - corticosteroid therapy
  - phenytoin
  - chronic heparin therapy
  - androgen deprivation therapy
  - aromatase inhibitors
- other
  - rheumatologic disorders
    - ♦ rheumatoid arthritis
    - ♦ SLE
    - ♦ ankylosing spondylitis
  - renal disease
  - poor nutrition
  - immobilization

## Clinical Features

- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus and wrist
  - fragility fractures: fracture with fall from standing height
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
  - x-ray: vertebral compression and crush fractures, wedge fractures, "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

## Approach to Osteoporosis

1. Assess risk factors for osteoporosis on history and physical
2. Decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women  $\geq 65$  yr or younger if presence of risk factors (Table 33)
3. Initial investigations:
  - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
  - also consider serum and urine protein electrophoresis, celiac workup and 24 h urinary  $\text{Ca}^{2+}$  excretion to rule out additional secondary causes
  - **25-OH-Vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level  $\geq 75$  nmol/L is achieved**
  - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture
4. Assess 10-yr fracture risk by combining BMD result and risk factors (only if  $\geq 50$  yr)
  - 1) WHO Fracture Risk Assessment Tool (FRAX);
  - 2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
    - ♦ approach to management guided by 10-yr risk stratification into low, medium, high risk
5. For all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 35)

**Table 33. Osteoporosis Risk Stratification**

<b>Low Risk</b> 10-yr fracture risk <10%	Unlikely to benefit from pharmacotherapy; encourage lifestyle changes Reassess risk in 5 yr
<b>Medium Risk</b> 10-yr fracture risk 10-20%	Discuss patient preference for management and consider additional risk factors Factors that warrant consideration for pharmacological therapy: <ul style="list-style-type: none"> <li>• Additional vertebral fracture(s) identified on vertebral fracture assessment (VFA) or lateral spine x-ray</li> <li>• Previous wrist fracture in individuals <math>\geq 65</math> or with T-score <math>\leq -2.5</math></li> <li>• Lumbar spine T-score much lower than femoral neck T-score</li> <li>• Rapid bone loss</li> <li>• Men receiving androgen-deprivation therapy for prostate cancer</li> <li>• Women receiving aromatase-inhibitor therapy for breast cancer</li> <li>• Long-term or repeated systemic glucocorticoid use (oral or parenteral) that does not meet the conventional criteria for recent prolonged systemic glucocorticoid use</li> <li>• Recurrent falls (defined as falling 2 or more times in the past 12 mo)</li> <li>• Other disorders strongly associated with osteoporosis</li> </ul> Repeat BMD and reassess risk every 1-3 yr initially
<b>High Risk</b> 10-yr fracture risk >20%; OR Prior fragility fracture of hip or spine; OR More than one fragility fracture	Start pharmacotherapy

**Corticosteroid Therapy is a Common Cause of Secondary Osteoporosis**  
 Individuals receiving  $\geq 7.5$  mg of prednisone daily for over 3 mo should be assessed for bone-sparing therapy  
 Mechanism: increased resorption + decreased formation

**Use of Calcium or Calcium in Combination with Vitamin D Supplementation to Prevent Fractures and Bone Loss in People Aged 50 Years and Older: A Meta-Analysis**

*Lancet* 2007;370:657-666

**Purpose:** To determine whether supplementation with calcium or calcium in combination with vitamin D reduces fractures of all types and percentage change of bone-mineral density from baseline.

**Study Selection:** RCTs that recruited people aged 50 yr or older.

**Results:** In trials that reported fracture as an outcome (17 trials,  $n=52,625$ ), treatment was associated with a 12% risk reduction in fractures of all types (risk ratio 0.88, 95% CI 0.83-0.95;  $p=0.0004$ ). In trials that reported bone-mineral density as an outcome (23 trials,  $n=41,419$ ), the treatment was associated with a reduced rate of bone loss of 0.54% (0.35-0.73;  $p<0.0001$ ) at the hip and 1.19% (0.76-1.61%;  $p<0.0001$ ) in the spine. The fracture risk reduction was significantly greater (24%) in trials in which the compliance rate was high ( $p<0.0001$ ). The treatment effect was better with calcium doses of 1200 mg or more (0.80 vs. 0.94;  $p=0.006$ ), and with vitamin D doses of 800 IU or more (0.84 vs. 0.87;  $p=0.03$ ).

**Conclusion:** Evidence supports the use of calcium, or calcium in combination with vitamin D supplementation, in the preventive treatment of osteoporosis in people aged 50 yr or older. For best therapeutic effect, use doses of 1200 mg of calcium, and 800 IU of vitamin D.

Table 34. Indications for BMD Testing

Older Adults (age $\geq 50$ yr)	Younger Adults (age $< 50$ yr)
<p>All women and men age <math>\geq 65</math> yr</p> <p>Menopausal women, and men aged 50-64 yr with clinical risk factors for fracture:</p> <ul style="list-style-type: none"> <li>• Fragility fracture after age 40</li> <li>• Prolonged glucocorticoid use</li> <li>• Other high-risk medication use (aromatase inhibitors, androgen deprivation therapy)</li> <li>• Parental hip fracture</li> <li>• Vertebral fracture or osteopenia identified on x-ray</li> <li>• Current smoking</li> <li>• High alcohol intake</li> <li>• Low body weight (<math>&lt; 60</math> kg) or major weight loss (<math>&gt; 10\%</math> of weight at age 25 yr)</li> <li>• Rheumatoid arthritis</li> <li>• Other disorders strongly associated with osteoporosis: primary hyperparathyroidism, Type 1 diabetes, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<math>&lt; 45</math> yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD and chronic inflammatory conditions (e.g. inflammatory bowel disease)</li> </ul>	<p>Fragility fracture</p> <ul style="list-style-type: none"> <li>• Prolonged use of glucocorticoids</li> <li>• Use of other high-risk medications (aromatase inhibitors, androgen deprivation therapy)</li> <li>• Hypogonadism or premature menopause</li> <li>• Malabsorption syndrome</li> <li>• Primary hyperparathyroidism</li> <li>• Other disorders strongly associated with rapid bone loss and/or fracture</li> </ul>

## Treatment of Osteoporosis

Table 35. Treatment of Osteoporosis in Women and Men

Treatment for both men and women	
<b>Lifestyle</b>	<p>Diet: Elemental calcium 1000-1200 mg/d; Vit D 1000 IU/d</p> <p>Exercise: 3x30 min weight-bearing exercises/wk</p> <p>Cessation of smoking, reduce caffeine intake</p> <p>Stop/avoid osteoporosis-inducing medications</p>
<b>Drug Therapy</b>	
<b>Bisphosphonate:</b> Inhibitors of osteoclast binding	<p>1st line in prevention of hip, nonvertebral and vertebral # (Grade A): alendronate, risedronate, zoledronic acid</p> <p>2nd line (Grade B): etidronate</p>
<b>RANKL inhibitors</b>	Denosumab: 1st line in prevention of hip, nonvertebral, vertebral # (Grade A)
<b>Parathyroid Hormone</b>	YES fragility #: 18-24 mo duration
<b>Calcitonin (2nd line):</b> osteoclast receptor binding	YES fragility #: Calcitonin 200 IU nasally OD with Calcitriol 0.25 $\mu$ g bid
Treatment specific to post-menopausal women	
<b>SERM (selective estrogen-receptor modulator):</b> agonistic effect on bone but antagonistic effect on uterus and breast	<p>Raloxifene: 1st line in prevention of vertebral # (Grade A)</p> <ul style="list-style-type: none"> <li>• +ve: prevents osteoporotic # (Grade A to B evidence), improves lipid profile, decreased breast ca risk</li> <li>• -ve: increased risk of DVT/PE, stroke mortality, hot flashes, leg cramps</li> </ul>
<b>HRT:</b> combined estrogen + progesterone (see <a href="#">Gynecology</a> , GY33)	<p>1st line in prevention of hip, nonvertebral and vertebral # (Grade A)</p> <p>For most women, risks <math>&gt;</math> benefits</p> <ul style="list-style-type: none"> <li>• Combined estrogen/progestin prevents hip, vertebral, total #</li> <li>• Increased risks of breast ca, cardiovascular events and DVT/PE</li> </ul>

### Clinical Signs of Fractures or Osteoporosis

- Height loss  $> 3$  cm (Sn 92%)
- Weight  $< 51$  kg
- Kyphosis (Sp 92%)
- Tooth count  $< 20$  (Sp 92%)
- Grip strength
- Armspan-height difference  $> 5$  cm (Sp 76%)
- Wall-occiput distance  $> 0$  cm (Sp 87%)
- Rib-pelvis distance  $\leq 2$  finger breadth (Sn 88%)

### Alendronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women

Cochrane DB Syst Rev 2008;1:CD001155

### Etidronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women

Cochrane Database Syst Rev. 2008;(1):CD003376

### Risedronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women

Cochrane Database Syst Rev. 2008;(1):CD004523

**Purpose:** To assess the efficacy of three bisphosphonates in the primary and secondary prevention of osteoporotic fractures in postmenopausal women.

**Study Selection:** Women receiving at least one yr of bisphosphonates for postmenopausal osteoporosis were compared to those receiving placebo or concurrent calcium/vitamin D or both. The outcome was fracture incidence.

**Results:** Levels of evidence: <http://www.cochranemsk.org/review/writing/>  
%RRR and %ARR for 5 yr fracture incidence reduction.

## Osteomalacia and Rickets

- **rickets:** osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue *prior* to epiphyseal closure (in childhood)
- **osteomalacia:** osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue *after* epiphyseal closure (in adulthood)

### Etiology and Pathophysiology

#### Vitamin D Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency
- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy
- loss of vitamin D binding protein
  - nephrotic syndrome
- defective 1- $\alpha$ -25 hydroxylation
  - hypoparathyroidism
  - renal failure
- pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

#### Mineralization Defect

- abnormal matrix
  - osteogenesis imperfecta
  - fibrogenesis imperfecta
  - axial osteomalacia
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - bisphosphonates, aluminum, high dose fluoride, anticonvulsants

#### Factors Necessary for Mineralization

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

**Table 36. Clinical Presentations of Rickets and Osteomalacia**

Rickets	Osteomalacia
<ul style="list-style-type: none"> <li>• Skeletal pain and deformities, bow legged</li> <li>• Fracture susceptibility</li> <li>• Weakness and hypotonia</li> <li>• Disturbed growth</li> <li>• Ricketic rosary (prominent costochondral junctions)</li> <li>• Harrison's groove (indentation of lower ribs)</li> <li>• Hypocalcemia</li> </ul>	<ul style="list-style-type: none"> <li>• Not as dramatic</li> <li>• Diffuse skeletal pain</li> <li>• Bone tenderness</li> <li>• Fractures</li> <li>• Gait disturbances (waddling)</li> <li>• Proximal muscle weakness</li> <li>• Hypotonia</li> </ul>

### Investigations

**Table 37. Laboratory Findings in Osteomalacia and Rickets**

Disorder	Serum Phosphate	Serum Calcium	Serum ALP	Other Features
Vitamin D deficiency	Decreased	Decreased to normal	Increased	Decreased calcitriol
Hypophosphatemia	Decreased	Normal	Decreased to normal	
Proximal RTA	Decreased	Normal	Normal	Associated with hyperchloremic metabolic acidosis
Conditions associated with abnormal matrix formation	Normal	Normal	Normal	

- radiologic findings
  - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profundus hip deformity
- bone biopsy: usually not necessary but considered the gold standard for diagnosis

### Treatment

- definitive treatment depends on the underlying cause
- vitamin D supplementation
- $\text{PO}_4^{3-}$  supplements if low serum  $\text{PO}_4^{3-}$ ,  $\text{Ca}^{2+}$  supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

## Renal Osteodystrophy

- changes to mineral metabolism and bone structure secondary to chronic kidney disease
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoid
- metastatic calcification secondary to hyperphosphatemia may occur

### Pathophysiology

- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits 1,25(OH)<sub>2</sub>-Vit. D synthesis) and loss of renal mass (reduced 1- $\alpha$ -hydroxylase)

### Clinical Features

- soft tissue calcifications → necrotic skin lesions if vessels involved
- osteodystrophy → generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

### Investigations

- serum Ca<sup>2+</sup> corrected for albumin, PO<sub>4</sub><sup>3-</sup>, PTH, ALP,  $\pm$  imaging (x-ray, BMD),  $\pm$  bone biopsy

### Treatment

- prevention
  - maintenance of normal serum Ca<sup>2+</sup> and PO<sub>4</sub><sup>3-</sup> by restricting PO<sub>4</sub><sup>3-</sup> intake to 1 g OD
  - Ca<sup>2+</sup> supplements; PO<sub>4</sub><sup>3-</sup> binding agents (calcium carbonate, aluminum hydroxide)
  - vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification

## Paget's Disease of Bone

### Definition

- a metabolic disease characterized by excessive bone destruction and repair

### Epidemiology

- a common disease: 5% of the population, 10% of population >80 yr old

### Etiology and Pathophysiology

- postulated to be related to a slow progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

### Differential Diagnosis

- primary bone lesions
  - osteogenic sarcoma
  - multiple myeloma
  - fibrous dysplasia
- secondary bone lesions
  - osteitis fibrosa cystica
  - metastases

### Clinical Features

- usually asymptomatic (routine x-ray finding or elevated ALP)
- severe bone pain (e.g. pelvis, femur, tibia) is often the presenting complaint
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- skull involvement: headaches, increased hat size, deafness
- increased warmth over involved bones due to increased vascularity
- high output congestive heart failure
- hypercalcemia with immobilization
- osteosarcoma

#### Comparison of a Single Infusion of Zoledronic Acid with Risedronate for Paget's Disease *NEJM* 2005;353:898-908

**Study:** Two identical, randomized, double-blind, actively controlled trials (combined for analysis).  
**Patients:** 357 men and women who were older than 30 yr of age and had radiologically confirmed Paget's disease. All but 4 patients had alkaline phosphatase levels that were more than twice the upper limit of normal.

**Intervention:** One 15-min infusion of 5 mg of zoledronic acid compared with 60 d of oral risedronate (30 mg/d) with follow up at 6 mo.

**Primary Outcome:** Rate of therapeutic response at 6 mo, defined as a normalization of alkaline phosphatase levels or a reduction of at least 75% in the total alkaline phosphatase excess.

**Results:** At 6 mo, 96% of patients receiving zoledronic acid had a therapeutic response (169 of 176), as compared with 74.3% of patients receiving risedronate (127 of 171,  $P < 0.001$ ). Alkaline phosphatase levels normalized in 88.6% of patients in the zoledronic acid group and 57.9% of patients in the risedronate group ( $P < 0.001$ ). Zoledronic acid was associated with a shorter median time to a first therapeutic response (64 vs. 89 d,  $P < 0.001$ ). Quality of life increased significantly from baseline at both 3 and 6 mo in the zoledronic acid group and differed significantly from those in the risedronate group at 3 mo. Pain scores improved in both groups. During post-trial follow-up (median, 190 d), 21 of 82 patients in the risedronate group had a loss of therapeutic response, as compared with 1 of 113 patients in the zoledronic acid group ( $P < 0.001$ ).

**Conclusions:** A single infusion of zoledronic acid produces more rapid, more complete, and more sustained responses in Paget's disease than does daily treatment with risedronate.

### Investigations

- laboratory
  - ↑↑ serum ALP (unless burnt out),  $\text{Ca}^{2+}$  normal or ↑,  $\text{PO}_4^{3-}$  normal
  - urinary hydroxyproline ↑ (indicates resorption)
- imaging
  - bone scan to evaluate the extent of disease
  - skeletal survey: involved bones are denser and expanded with cortical thickening
    - initial lesion may be destructive and radiolucent
    - multiple fissure fractures in long bones

### Complications

- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
    - indicated by marked bone pain, new lytic lesions and sudden increased ALP
- systemic
  - hypercalcemia and nephrolithiasis
  - high output congestive heart failure due to increased vascularity

### Treatment

- symptomatic therapy (pain management)
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if ALP >3x normal
  - bisphosphonates, e.g. alendronate 40 mg PO OD x 6 mo OR risedronate 30 mg PO OD x 3 mo OR zoledronic acid 5 mg IV per year
  - calcitonin 50-100 U/d SC
- surgery for fractures, deformity, degenerative changes

## Male Reproductive Endocrinology

### Androgen Regulation

- negative feedback may occur by androgens directly or after conversion to estrogen
- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

### Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm)
- LH, FSH, total and/or bioavailable testosterone
- human chorionic gonadotropin (hCG) stimulation test
  - assesses ability of Leydig cell to respond to gonadotropin
- semen analysis
  - semen volume, sperm count, morphology and motility
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

### Hypogonadism and Infertility

- see [Urology](#), U34
- deficiency in gametogenesis or testosterone production

### Etiology

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure) and idiopathic
- primary hypogonadism is more common than secondary

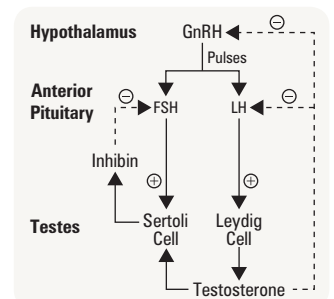

Figure 18. Hypothalmo-pituitary-gonadal axis

**Table 38. Classification and Features of Hypogonadism**

	<b>Hypergonadotropic Hypogonadism (Primary Hypogonadism)</b>	<b>Hypogonadotropic Hypogonadism (Secondary Hypogonadism)</b>
<b>Definition</b>	Primary testicular failure ↑ LH and FSH, ↑ FSH:LH ratio ↓ testosterone and sperm count	Hypothalamic-pituitary axis failure ↓ LH + FSH ↓ testosterone and sperm count
<b>Etiology</b>	Congenital: <ul style="list-style-type: none"> <li>Chromosomal defects (Klinefelter's, Noonan)</li> <li>Cryptorchidism</li> <li>Male pseudohermaphroditism</li> <li>Bilateral anorchia (vanishing testicle syndrome)</li> <li>Myotonic dystrophy</li> <li>Mutation of FSH or LH receptor gene</li> <li>Disorders of androgen synthesis</li> </ul> Germ cell defects <ul style="list-style-type: none"> <li>Sertoli cell only syndrome</li> <li>Leydig cell aplasia/failure</li> </ul> Infection/Inflammation <ul style="list-style-type: none"> <li>Orchitis – TB, lymphoma, mumps, leprosy</li> <li>Genital tract infection</li> </ul> Physical factors <ul style="list-style-type: none"> <li>Trauma, heat, irradiation, testicular torsion, varicocele</li> </ul> Drugs <ul style="list-style-type: none"> <li>Marijuana, alcohol, chemotherapy, ketoconazole, glucocorticoid, spironolactone</li> </ul> Autoimmune (antisperm antibodies)           Chronic systemic diseases (AIDS)           Idiopathic	Congenital <ul style="list-style-type: none"> <li>Kallman's syndrome</li> <li>Prader-Willi syndrome</li> <li>Abnormal subunit of LH or FSH</li> </ul> Infection <ul style="list-style-type: none"> <li>Tuberculosis, meningitis</li> </ul> Endocrine <ul style="list-style-type: none"> <li>Adrenal androgen excess</li> <li>Cushing's syndrome</li> <li>Hypo or hyperthyroidism</li> <li>Hypothalamic-pituitary disease (tumour, hyperprolactinemia, hypopituitarism)</li> </ul> Drugs <ul style="list-style-type: none"> <li>Alcohol, marijuana, spironolactone, ketoconazole, GnRH agonists, androgen/estrogen/progestin use, chronic narcotic use</li> </ul> Chronic illness <ul style="list-style-type: none"> <li>Cirrhosis, chronic renal failure, AIDS</li> <li>Sarcoidosis, Langerhan's cell histiocytosis, hemochromatosis</li> </ul> Critical illness <ul style="list-style-type: none"> <li>Surgery, MI, head trauma</li> </ul> Obesity           Idiopathic
<b>Diagnosis</b>	<b>Testicular size and consistency (soft/firm)</b> Sperm count LH, FSH, total and/or bioavailable testosterone hCG stimulation Karyotype	<b>Testicular size and consistency (soft/firm)</b> Sperm count LH, FSH, total and/or bioavailable testosterone Prolactin levels MRI of hypothalamic-pituitary region

**Treatment**

- testosterone replacement (improve libido, muscle mass, strength, hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy
  - contraindicated if history of prostate cancer
- GnRH agonist to restore fertility, if hypothalamic dysfunction with intact pituitary
  - administered SC in pulsatile fashion using an external pump
- hCG ± human menopausal gonadotropin (hMG) (to supply FSH) can be used to restore fertility in cases of either hypothalamic or pituitary lesions
- surgery – only if testicular tissues are not functioning

**Other Causes of Male Infertility**

- hereditary disorders: Kartagener syndrome, cystic fibrosis
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: TURP, radical prostatectomy, orchiectomy

**DEFECTS IN ANDROGEN ACTION****Etiology**

- complete androgen insensitivity (testicular feminization)
- incomplete androgen insensitivity
  - 5- $\alpha$ -reductase deficiency
  - mixed gonadal dysgenesis
  - defects in testosterone synthesis
- infertile male syndrome
- undervirilized fertile male syndrome

**Clinical Features**

- depends on age of onset

**Two Distinct Features of Primary Hypogonadism**

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

**Two Features of Secondary Hypogonadism**

- Associated with an equivalent decrease in sperm count and serum testosterone
- Less likely to be associated with gynecomastia

**Approach to Male Infertility**

**Infertility:** failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women <35 yr of age; and after 6 mo of regular intercourse without use of contraception in women ≥35 yr.

**History**

- Partner status re: infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Prev Surg, Med Hx, STI Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking

**P/E**

- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

**Investigations**

Should be considered for couples unable to conceive after 12 mo of unprotected and frequent intercourse. Consider earlier evaluation if suggestive medical hx and physical, and in women ≥35 yr of age

- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Bloodwork: LH, FSH, testosterone, prolactin, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see **Gynecology**, GY22)

**Treatment**

- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, IVF, therapeutic donor insemination, testicular aspiration of sperm, adoption

**Table 39. Effects of Testosterone Deficiency**

<b>First trimester in utero</b>	Incomplete virilization of external genitalia (ambiguous genitalia) Incomplete development of Wolffian ducts to form male internal genitalia (male pseudohermaphroditism)
<b>Third trimester in utero</b>	Micropenis Cryptorchidism (failure of normal testicular descent)
<b>Prepuberty</b>	Incomplete pubertal maturation (high pitch voice, sparse pubic + axillary hair, absence of facial hair) Eunuchoidal body habitus (greater growth of extremity long bones relative to axial bones) Poor muscle development, reduced peak bone mass
<b>Postpuberty</b>	Decrease in energy, mood, and libido Fine wrinkles in corners of mouth and eyes Decrease in pubic/axillary hair, hematocrit, muscle mass, strength and BMD

Adapted from UpToDate, 2010 + Cecil's Essentials of Medicine

**Treatment**

- appropriate gender assignment in the newborn
- hormone replacement or supplementation
- psychological support
- gonadectomy for cryptorchidism (due to increased risk for testicular cancer)
- reduction mammoplasty for gynecomastia

**Erectile Dysfunction**

- see [Urology](#), U30

**Gynecomastia****Definition**

- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals and does not warrant further evaluation

**Etiology****Physiologic**

- puberty
- elderly (involutional)
- neonatal (maternal hormone)

**Pathologic**

- endocrinopathies: primary or secondary hypogonadism, hyperthyroidism, extreme hyperprolactinemia, adrenal disease
- tumours: pituitary, adrenal, testicular, breast, ectopic production of hCG
- chronic diseases: cirrhosis, renal, malnutrition (with refeeding)
- drugs: estrogens and estrogen agonists, spironolactone, ketoconazole, cimetidine, digoxin, chemotherapy, marijuana, alcohol
- congenital/genetic: Klinefelter's syndrome, androgen insensitivity
- other: idiopathic, familial

**Pathophysiology**

- decreased androgen production + increased estrogen production
- increased availability of estrogen precursors for peripheral conversion to estrogen
- androgen receptor blockage + binding of androgen to sex hormone binding globulin (SHBG)

**History**

- recent change in breast characteristics
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

**Occurrence of Gynecomastia**

3 peaks	% affected
Infancy	60-90
Puberty	4-69
Ages 50-80	24-65

**Causes of Gynecomastia****DOC TECH**

Drugs  
Other  
Congenital  
Tumour  
Endocrine  
CHronic disease

**Physical Exam**

- signs of feminization
- breast
  - must differentiate from breast cancer (unilateral, eccentric, hard/firm mass, fixed to underlying tissue) with possible skin changes (dimpling, retraction) or nipple changes (discharge, crusting)
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue, and no discrete mass is palpable
- genito-urinary exam
- stigmata of liver or thyroid disease

**Investigations**

- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated need to locate the primary tumour)
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S to rule out testicular mass
- MRI of hypothalamic-pituitary region if pituitary adenoma suspected

**Treatment**

- initial observation for most men with gynecomastia
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen, clomiphene
- surgical
  - usually required for macromastia; gynecomastia present for >1 yr (fibrosis is unresponsive to medication); or failed medical treatment and for cosmetic purposes

## Female Reproductive Endocrinology

- see [Gynecology](#), GY4

## Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

**Table 40. Clinical Presentation**

Syndrome Class	Symptoms/Syndrome	Associated Malignancies	Mechanism
<b>Endocrine</b>	Cushing's syndrome	Small-cell lung cancer Pancreatic carcinoma Neural tumours Thymoma	Ectopic ACTH and ACTH-like substance secretion
	SIADH	Small-cell lung cancer CNS malignancies	Antidiuretic hormone secretion
	Hypercalcemia	Lung cancer Breast carcinoma Renal cell carcinoma Multiple myeloma Ovarian carcinoma	PTH-related protein, TGF- $\alpha$ , TNF secretion
	Hypoglycemia	Hepatocellular carcinoma Fibrosarcoma	Insulin or insulin-like substance secretion
	Carcinoid	Pancreatic carcinoma Gastric carcinoma	Serotonin, bradykinin secretion
<b>Neurologic</b>	Lambert-Eaton myasthenic syndrome (LEMS) • muscle weakness in limbs	Small-cell lung cancer	Ab interferes with ACh release
	Myasthenia gravis • fluctuating muscle weakness and fatiguability	Thymoma	Ab interferes with ACh release
	Paraneoplastic limbic encephalitis • depression, seizures, short-term memory loss	Small-cell lung cancer	Unknown
<b>Renal</b>	Hypokalemic nephropathy	Small-cell lung cancer	Ectopic ACTH and ACTH-like substance secretion
	Nephrotic syndrome	Lymphoma Melanomas	Immunocomplex sedimentation in nephrons
<b>GI</b>	Watery diarrhea	Medullary thyroid carcinomas	Prostaglandin secretion
<b>Hematologic</b>	Erythrocytosis	Renal cell carcinoma Hepatocellular carcinoma	EPO production
<b>Rheumatologic</b>	SLE	Lymphomas Lung cancer Breast carcinoma Gonadal carcinoma	Anti-nuclear Ab production
	Scleroderma	Breast carcinoma Lung cancer Uterine cancer	Anti-nuclear Ab production

### Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, ESR, C-reactive protein, serum/urine electrophoresis,
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, PET scan
- $\pm$  endoscopy

### Treatment

- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: IVIG, steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

## Common Medications

## Diabetes Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments
Biguanide	<ul style="list-style-type: none"> <li>Sensitizes peripheral tissues to insulin → increases glucose uptake</li> <li>Decreases hepatic glucose production by stimulation of hepatic AMP-activated protein kinase (AMPK)</li> </ul>	metformin	Glucophage® Glumetza®		500 mg OD titrated to 2000 mg/d maximum	<ul style="list-style-type: none"> <li>Useful in obese Type 2 DM</li> <li>Improves both fasting and postprandial hyperglycemia</li> <li>Also ↓ TG</li> </ul>	<b>ABSOLUTE:</b> <ul style="list-style-type: none"> <li>Moderate to severe liver dysfunction</li> <li>Moderate renal dysfunction GFR &lt;30 mL/min</li> <li>Cardiac dysfunction</li> </ul>	<ul style="list-style-type: none"> <li>GI upset (abdo discomfort, bloating, diarrhea)</li> <li>Lactic acidosis</li> <li>Anorexia</li> </ul>	↓ HbA1c 1.0-2.0%
Insulin secretagogue	<ul style="list-style-type: none"> <li>Stimulates insulin release from β cells by causing K<sup>+</sup> channel closure → depolarization → Ca<sup>2+</sup> mediated insulin release</li> <li>Use in nonobese Type 2 DM</li> </ul>	sulfonylureas: glyburide	Diabeta® Euglucon®	Micronase® Glynase PreTab®	2.5-5.0 mg/d titrated to >5 mg bid Max: 20 mg/d		<b>ABSOLUTE:</b> <ul style="list-style-type: none"> <li>Moderate to severe liver dysfunction</li> </ul> <b>RELATIVE (glyburide and glimepiride):</b> <ul style="list-style-type: none"> <li>Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction</li> <li>Avoid glyburide in the elderly</li> </ul> <b>INTERACTIONS:</b> <ul style="list-style-type: none"> <li>Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin</li> </ul>	<ul style="list-style-type: none"> <li>Hypoglycemia</li> <li>Weight gain</li> </ul>	↓ HbA1c 1.0-2.0%
		gliazide	Diamicon® Diamicon® MR		40-160 mg bid 30-120 mg OD				
		glimepiride	Amaryl®		1-8 mg OD				
		non-sulfonylureas: repaglinide	GlucNorm®		0.5-4 mg tid	<ul style="list-style-type: none"> <li>Short t<sub>1/2</sub> of 1 h causes brief but rapid ↑ in insulin, therefore effective for post-prandial control</li> </ul>	<b>ABSOLUTE:</b> <ul style="list-style-type: none"> <li>Severe liver dysfunction</li> </ul> <b>INTERACTIONS:</b> <ul style="list-style-type: none"> <li>Do not combine with a non-sulfonylurea or pre-prandial insulin</li> </ul>	<ul style="list-style-type: none"> <li>Hypoglycemia</li> <li>Weight gain</li> </ul>	↓ HbA1c 1.0-1.5% for repaglinide and 0.5-1.0% for nateglinide
Insulin sensitizers (thiazolidinedione)	<ul style="list-style-type: none"> <li>Sensitizes peripheral tissues to insulin → increases glucose uptake</li> <li>Decreases FFA release from adipose</li> <li>Binds to nuclear receptor PPAR-γ</li> </ul>	rosiglitazone	Avandia®		2-8 mg OD	<ul style="list-style-type: none"> <li>Rosiglitazone – indicated only in patients with type 2 diabetes mellitus for whom all other oral antidiabetic agents, in monotherapy or in combination, do not result in adequate glycemic control or are inappropriate due to contraindications or intolerance</li> </ul>	<b>ABSOLUTE:</b> <ul style="list-style-type: none"> <li>NYHA &gt; class II CHF</li> </ul> <b>INTERACTIONS:</b> <ul style="list-style-type: none"> <li>Do not combine with insulin</li> </ul>	<ul style="list-style-type: none"> <li>Peripheral edema</li> <li>CHF</li> <li>Anemia</li> <li>Fluid retention and congestive heart failure</li> <li>Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing)</li> <li>Increased risk of bladder cancer with pioglitazone</li> <li>Fractures</li> </ul>	↓ HbA1c 1.0-1.5%
		pioglitazone	Actos®		15-45 mg OD

Glucagon-like peptide (GLP)-1 analogue	<ul style="list-style-type: none"> <li>Binds to GLP-1 receptor to promote insulin release</li> <li>Insulinotropic effect suppressed as plasma glucose &lt;4 mmol/L</li> <li>Slows gastric emptying, suppress inappropriately elevated glucagon levels</li> <li>Causes β-cell regeneration and differentiation in vitro</li> </ul>	Exenatide		Byetta®	5-10 µg SC bid 1 h before meals		<b>ABSOLUTE:</b> <ul style="list-style-type: none"> <li>Type 1 DM</li> <li>DKA</li> <li>Acute pancreatitis hx</li> </ul> <b>RELATIVE:</b> <ul style="list-style-type: none"> <li>Gastroparesis</li> <li>ESRD</li> <li>Personal or family history of medullary thyroid cancer (MTC)</li> </ul>	<ul style="list-style-type: none"> <li>Nausea, vomiting, diarrhea</li> <li>Dizziness, headache</li> <li>Muscle weakness</li> <li>Anti-exentide antibodies</li> <li>Pancreatitis</li> </ul>	↓ HbA1c 1.0-1.5%
		Liraglutide		Victoza®	0.6-1.8 mg OD SC				

For insulin formulations, please refer to E9

## Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
HMG CoA reductase inhibitor	• Inhibits cholesterol biosynthesis, ↓ LDL synthesis, ↑ LDL clearance, modest ↑ HDL, limited ↓ VLDL	atorvastatin fluvastatin lovastatin pravastatin rosuvastatin simvastatin	Lipitor® Lescol® Mevacor® Pravachol® Crestor® Zocor®		10-80 mg/d 20-80 mg/d 20-80 mg/d 10-40 mg/d 5-40 mg/d 10-80 mg/d	• 1 <sup>st</sup> line monotherapy • Used for ↑ LDL, ↑ TG	• Active liver disease • Persistent ↑ in AST, ALT unexplained	• GI symptoms • Rash, pruritus • ↑ liver enzymes • Myositis (↑ risk if combined with fibrates) • Rhabdomyolysis
Fibrates	• Upregulate lipoprotein lipase + apo A1, ↓ VLDL, ↓ TG, modest ↓ LDL, modest ↑ HDL	bezafibrate fenofibrate gemfibrozil	Bezalip® Lipidil® Lopid®		400 mg/d 48-200 mg/d 600-1200 mg/d	• Used for ↑ TG, hyperchylomicronemia	• Hepatic disease • Renal disease	• GI upset • Skin rashes • ↑ risk of gallstone formation • ↑ risk of rhabdomyolysis when combined with statins
Niacin	• Inhibits secretion of hepatic VLDL via lipoprotein lipase (LPL) pathway → decreased VLDL and LDL; decreased clearance of HDL	nicotinic acid	Niaspan® generic niacin	Niacor®	0.5-2 g/d 1-3 g/d	• Used for ↑ LDL, ↑ VLDL	• Hypersensitivity • Hepatic dysfunction • Active PUD • Hyperuricemia	• Generalized flushing • Abnormal liver enzymes • Pruritus • IGT • Watch glucose control with overt DM
Bile acid sequestrants	• Resins that bind bile acids in intestinal lumen and prevent absorption thereby ↓ LDL	cholestyramine  colestipol	Questran®  Colestid®		2-24 g/d  5-30 g/d	• Used for ↑ LDL • Use as adjunct with statins or fibrates	• Complete biliary obstruction • Pregnancy, lactation • TG > 3.5 mmol/L • GI motility disorder	• Constipation • Nausea • Flatulence • Bloating • Rise in TG
Cholesterol absorption inhibitors	• Inhibits cholesterol absorption at the small intestine brush border	ezetimibe	Ezetrol®	Zetia®	10 mg/d	• Used for ↑ LDL, apo B	• Hypersensitivity • Hepatic dysfunction • Don't combine with fibrates or bile acid resins	• Fatigue • Pharyngitis • Sinusitis • Abdominal pain • Diarrhea • Arthralgia

## Thyroid Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Antithyroid Agent (thionamides)	• Decreases thyroid hormone production by inhibiting iodine and peroxidase from interacting with thyroglobulin to form T <sub>4</sub> and T <sub>3</sub> • PTU also interferes with conversion of T <sub>4</sub> to T <sub>3</sub>	propylthiouracil (PTU)  methimazole (MMI)	Propyl-Thyracil®  Tapazole®		Start 100 mg PO tid, then adjust accordingly Thyroid storm: start 200-300 PO qid, then adjust accordingly  Start 5-20 mg PO OD, then adjust accordingly Up to 60 mg OD may be required	• Hyperthyroidism	• Hypersensitivity • Relative: renal failure, liver disease • PTU recommended in 1st trimester, MMI during 2nd and 3rd trimester. • Lactation: safe with PTU <300 mg/day and MMI <20-30 mg/d	• Nausea, vomiting • Rash • Drug-induced hepatitis • Agranulocytosis • Hepatitis with PTU • Cholestasis with MMI
Thyroid hormone	• Synthetic form of thyroxine (T <sub>4</sub> )	levothyroxine l-thyroxine	Synthroid® Eltroxin®	Levoxy®	0.05-2.0 mg/d, usually 1.6 times weight in kg is dose in micrograms In elderly patients start at 0.025 mg/d	• Hypothyroidism	• Recent MI, thyrotoxicosis	• If wrong dosing: symptoms of hypothyroidism or hyperthyroidism • Skin rash from dye in pill
Antithyroid Agent Radiopharmaceutical	• Radioactive isotope of iodine that is incorporated into the thyroid gland irradiating the area and destroying local glandular tissue	sodium iodide I-131	Iodotope®		Dose corrected for 24 h radioactive iodine uptake. Hyperthyroidism 4-12 mCi Thyroid Ca 50-150 mCi	• Hyperthyroidism • Thyroid Malignancy	• Hypersensitivity • Concurrent antithyroid medication • Pregnancy, lactation	• Nausea, vomiting • Bone marrow suppression • Sialadenitis • Thyroiditis

## Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Bisphosphonates	• Inhibits osteoclast-mediated bone resorption	alendronate	Fosamax®		Osteoporosis: 5-10 mg OD 70 mg once weekly Paget's: 40 mg OD for 6 mo	<ul style="list-style-type: none"> <li>Prevention of postmenopausal osteoporosis</li> <li>Treatment of osteoporosis</li> <li>Glucocorticoid-induced osteoporosis</li> <li>Paget's disease</li> </ul>	<ul style="list-style-type: none"> <li>Esophageal stricture or achalasia (oral)</li> <li>Unable to stand or sit upright for &gt;30 min (oral)</li> <li>Hypersensitivity</li> <li>Hypocalcemia</li> <li>Renal insufficiency</li> </ul>	<ul style="list-style-type: none"> <li>GI</li> <li>MSK pain</li> <li>Headache</li> <li>Osteonecrosis of the jaw</li> </ul>
		risedronate	Actonel®		Osteoporosis: 5 mg OD 35 mg once weekly 150 mg once monthly Paget's: 30 mg OD for 2 mo	<ul style="list-style-type: none"> <li>Treatment and prevention of postmenopausal osteoporosis</li> <li>Treatment and prevention of glucocorticoid-induced osteoporosis</li> <li>Paget's disease</li> </ul>		
		etidronate	Didronel®		Paget's: 5-10 mg /kg OD x 6 mo	<ul style="list-style-type: none"> <li>Symptomatic Paget's disease</li> <li>Prevention and treatment of heterotopic ossification after total hip replacement or spinal cord injury</li> </ul>		
		ibandronate	Boniva®		2.5 mg OD or 150 mg once monthly	<ul style="list-style-type: none"> <li>Treatment and prevention of postmenopausal osteoporosis (US only)</li> </ul>		
		pamidronate	Aredia®		Hypercalcemia of malignancy 60-90 mg IV over 2-24 h Wait at least 7 d before considering retreatment	<ul style="list-style-type: none"> <li>Hypercalcemia of malignancy</li> <li>Paget's disease</li> <li>Osteolytic bone metastases of breast cancer</li> <li>Osteolytic lesions of multiple myeloma</li> </ul>		
		zoledronate	Zometa® Aclasta®		5 mg IV once yearly IV	<ul style="list-style-type: none"> <li>Treatment of osteoporosis</li> <li>Hypercalcemia of malignancy</li> <li>Treatment and prevention of skeletal complications related to cancer</li> </ul>		
Selective Estrogen Receptor Modulators	• Decreases resorption of bone through binding to estrogen receptors	raloxifene	Evista®		60 mg OD	<ul style="list-style-type: none"> <li>Treatment and prevention of postmenopausal osteoporosis (2nd line)</li> </ul>	<ul style="list-style-type: none"> <li>Lactation</li> <li>Pregnancy</li> <li>Active or past history of DVT, PE or retinal vein thrombosis</li> </ul>	<ul style="list-style-type: none"> <li>Hot flashes</li> <li>Leg cramps</li> <li>Increased risk of fatal stroke, venous thromboembolism</li> </ul>
Calcitonin	• Inhibits osteoclast-mediated bone resorption	calcitonin	Miacalcin®		One spray (200 IU) per day, alternating nostrils	<ul style="list-style-type: none"> <li>Treatment of postmenopausal osteoporosis, greater than 5 yr postmenopause</li> </ul>	<ul style="list-style-type: none"> <li>Clinical allergy to salmon-calcitonin</li> </ul>	<ul style="list-style-type: none"> <li>Rhinitis</li> <li>Epistaxis</li> <li>Sinusitis</li> <li>Nasal dryness</li> </ul>
Anti-RANKL monoclonal Ab	• Inhibits RANKL (osteoclast differentiating factor) → inhibit osteoclast formation and decrease bone resorption	denosumab	Prolia™	Xgeva™	60 mg SC q6mo	<ul style="list-style-type: none"> <li>Treatment of postmenopausal women at high risk of fracture</li> <li>Prevent skeletal-related events in patients with bone metastasis from solid tumours</li> </ul>	<ul style="list-style-type: none"> <li>Hypocalcemia</li> </ul>	<ul style="list-style-type: none"> <li>Fatigue/headache</li> <li>Dermatitis/rash</li> <li>Hypophosphatemia/Hypocalcemia</li> <li>Hypercholesterolemia</li> <li>GI discomfort</li> </ul>
PTH	• Stimulates new bone formation by preferential stimulation of osteoblastic activity over osteoclastic activity	teriparatide	Forteo®		20 µg SC OD X 18-24 mo	<ul style="list-style-type: none"> <li>Treatment of postmenopausal women with osteoporosis who are at high risk for fracture</li> <li>Treatment of men with primary or hypogonadal osteoporosis who are at high risk for fracture</li> </ul>	<ul style="list-style-type: none"> <li>Paget's disease</li> <li>Prior external beam or implant radiation therapy involving the skeleton</li> <li>Bone metastases</li> <li>Metabolic bone diseases other than osteoporosis</li> </ul>	<ul style="list-style-type: none"> <li>Orthostatic hypotension</li> <li>Hypercalcemia</li> <li>Dizziness</li> <li>Leg cramps</li> </ul>

## Metabolic Bone Disease Medications (continued)

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Calcium	• Inhibits PTH secretion				1200 mg/d (including diet) Divided in 3 doses	<ul style="list-style-type: none"> <li>• Osteopenia</li> <li>• Osteoporosis</li> <li>• Prevention of metabolic bone disease</li> </ul>	<ul style="list-style-type: none"> <li>• Caution with renal stones</li> </ul>	<ul style="list-style-type: none"> <li>• Vomiting</li> <li>• Constipation</li> <li>• Dry mouth</li> </ul>
Vitamin D	• Regulation of calcium and phosphate homeostasis	cholecalciferol (vitamin D3)			800 -2000 IU/d	<ul style="list-style-type: none"> <li>• Osteopenia</li> <li>• Osteoporosis</li> <li>• Prevention of metabolic bone disease</li> </ul>	<ul style="list-style-type: none"> <li>• Caution in patients on digoxin (risk of hypercalcemia which may precipitate arrhythmia)</li> </ul>	<ul style="list-style-type: none"> <li>• Hypercalcemia</li> <li>• Headache</li> <li>• Nausea, vomiting</li> <li>• Constipation</li> </ul>
		ergocalciferol (vitamin D2)	Drisdol® Erdol®		50,000 IU/wk	<ul style="list-style-type: none"> <li>• Osteoporosis in patients with liver dysfunction, refractory rickets, hypoparathyroidism</li> </ul>	<ul style="list-style-type: none"> <li>• Hypercalcemia</li> <li>• Malabsorption syndrome</li> <li>• Decreased renal function</li> </ul>	
		calcitriol (1,25(OH) <sub>2</sub> -D)	Rocaltrol® Calcijex®		Start 0.25 µg/d Titrate up by 0.25 µg/d at 4-8 wk intervals to 0.5-1 µg/d  Start 0.25 µg/d Titrate up by 0.25 µg/d at 2-4 wk intervals to 0.5-2 µg/d	<ul style="list-style-type: none"> <li>• Hypocalcemia and osteodystrophy in patients with chronic renal failure on dialysis</li> <li>• Hypoparathyroidism</li> </ul>	<ul style="list-style-type: none"> <li>• Hypercalcemia</li> <li>• Vitamin D toxicity</li> </ul>	

## Adrenal Medications

Drug Class	Mineralocorticoid Activity	Generic Drug Name	Potency (relative to Cortisol)	Equivalent Dose (mg)	Duration of Action (t <sub>1/2</sub> in h)	Dosing	Comments
Hydrocortisone	Yes	Cortef Solu-Cortef	1.0	20	8	<u>Adrenal Crisis:</u> 50-100 mg IV bolus, then 50-100 mg q8h (continuous infusion x 24-48 h) PO once stable (50 mg q8h x 48 h, then taper over 14 d) <u>Chronic AI:</u> 15-20 mg PO OD (2/3 AM, 1/3 PM)	<ul style="list-style-type: none"> <li>• In high doses, mineralocorticoid side effects may emerge (salt + water retention, ECF volume expansion, HTN, low K<sup>+</sup> metabolic alkalosis)</li> </ul>
Cortisone acetate	Yes	Cortisone Acetate	0.8	25	oral = 8 IM = 18+	<u>Adrenal Crisis:</u> 75-300 mg/d PO/IM divided q12-24h <u>Chronic AI:</u> 25 mg/d	<ul style="list-style-type: none"> <li>• Pro-drug which is converted to active form as hydrocortisone</li> <li>• High doses can result in mineralocorticoid side effects (see above)</li> </ul>
Prednisone	No	Prednisone	4	5	16-36	<u>Adrenal Crisis:</u> 15-60 mg/d PO qd or divided bid/qid <u>Chronic AI:</u> 5 mg daily	<ul style="list-style-type: none"> <li>• Pro-drug which is converted to active form as prednisolone</li> </ul>
Dexamethasone	No	Dexamethasone	30	0.7	36-54	<u>Adrenal Crisis:</u> 4 mg IV; repeat q2-6h if necessary	<ul style="list-style-type: none"> <li>• Used for undiagnosed adrenal insufficiency (won't interfere with measurement of serum cortisol levels)</li> </ul>

## Landmark Endocrinology Trials

Trial	Reference	Results
<b>DIABETES</b>		
ACCORD	<i>NEJM</i> 2008; 358:2560-72	Compared with standard therapy the use of intensive therapy to target normal HbA1c levels (<6%) for 3.5 yr increased mortality and did not significantly reduce major cardiovascular events
ADVANCE	<i>NEJM</i> 2008; 358:2545-59	Intensive glucose control that lowered the HbA1c value to 6.5% reduced the incidence of nephropathy but did not significantly reduce major macrovascular events, death from cardiovascular events or death from any cause. Hypoglycemia was more common in the intensive control group
BARI-2D	<i>NEJM</i> 2009; 360:2503-15	In patients with both Type 2 DM and coronary artery disease no significant difference was found in the rates of death and major cardiovascular events in patients undergoing prompt revascularization and those undergoing medical therapy or between strategies of insulin sensitization and insulin
DCCT	<i>NEJM</i> 1993; 329:977-86	Intensive blood glucose control delayed the onset and reduced the progression of microvascular complications (retinopathy, nephropathy and neuropathy) in Type 1 DM
EDIC	<i>NEJM</i> 2005; 353:2644-53	Compared with conventional therapy intensive diabetes therapy early on without macrovascular disease (goal HbA1c <6.05%) has long-term beneficial effects on the risk of cardiovascular disease in patients with Type 1 DM
NAVIGATOR	<i>NEJM</i> 2010; 362:1463-90	In patients with impaired glucose tolerance, nateglinide did not reduce progression to diabetes or risk of cardiovascular events while valsartan only reduced progression to diabetes
Steno-2	<i>NEJM</i> 2008; 358:580-91	In at-risk patients with Type 2 DM intensive intervention with multiple drug combinations and behaviour modification had sustained significant beneficial effects with respect to vascular complications and mortality. Multifactorial intervention is critical in the management of Type 2 DM
UKPDS	<i>Lancet</i> 1998; 352:837-53	Intensive blood glucose control reduces microvascular but not macrovascular complications in Type 2 DM
UKPDS extension	<i>NEJM</i> 2008; 359:1577-89	Continued risk reduction in microvascular risk and emergent risk reductions for myocardial infarction and death from any cause 10 yr post UKPDS trial follow up in Type 2 DM
VADT	<i>NEJM</i> 2009; 360:1-11	In patients with longstanding poorly controlled Type 2 DM intensive glucose control had no significant effect on the rates of major cardiovascular events, death or microvascular complications. Adverse events, predominantly hypoglycemia, were more common in the intensive control group
<b>LIPIDS</b>		
4S	<i>Lancet</i> 1994; 344:1383-89	In patients with angina or previous MI and high total cholesterol simvastatin reduced: all-cause mortality, fatal and nonfatal coronary events, and need for coronary artery bypass surgery or angioplasty
FIELD	<i>Lancet</i> 2005; 366:1849-61	In patients with Type 2 DM not previously on statin therapy fenofibrate did not significantly reduce the risk of the primary outcome of coronary events. It did reduce non-fatal myocardial infarctions and revascularizations
HPS	<i>Lancet</i> 2002; 360:7-22	In high-risk patients with various cholesterol values simvastatin reduced all-cause mortality, coronary deaths and major vascular events
Jupiter	<i>NEJM</i> 2008; 359:2195-207	Rosuvastatin significantly reduced the incidence of major cardiovascular events in patients with elevated high-sensitivity C-reactive protein levels and no hyperlipidemia
TNT	<i>NEJM</i> 2005; 352:1425-35	Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d

FRS	Framingham Risk Score					WSIB	Workplace Safety and Insurance Board

# Four Principles of Family Medicine

## College of Family Physicians of Canada Guidelines

### 1. The family physician is a skilled clinician

- in diagnosing and managing diseases common to the population served
- recognizes importance of early diagnosis of serious life-threatening illnesses

### 2. Family medicine is a community-based discipline

- provides information and access to community services
- responds/adapts to changing needs and circumstances of the community

### 3. The family physician is a resource to a defined practice population

- serves as a health resource
- advocates for public policy to promote health

### 4. The patient-physician relationship is central to the role of the family physician

- committed to the person, not just the disease
- promotes continuity of patient care

#### Patient-Centred Clinical Method

- Explore/define patient problems and decide on management together
- Consider both agendas and find common ground

#### Agendas in Family Medicine

##### Doctor's Agenda

History, physical, investigations, diagnosis, plan

##### Patient's Agenda

##### FIFE

**Feelings:** related to the illness, fears (how do you feel about what is happening?)

**Ideas:** and explanations of the cause (what do you think is going on?)

**Function:** the illness' impact on daily life (how is it affecting your work or life?)

**Expectations:** of the doctor and the illness (what were you expecting at the visit?)

#### Adult Periodic Health Exam

Male and female evidence-based preventative care checklist forms are available online at <http://www.cfpc.ca>.

#### When Ordering Fasting Bloodwork

- Routinely ordered as  $\geq 12$  h of fasting
- Remember, "fasting" means no food, no drinks (except small quantities of water), no gum, no smoking
- Prescription medications are okay unless otherwise specified
- Special care should be taken when ordering fasting bloodwork in elderly or other medically fragile patients

#### A Note About PSA:

- Routine PSA screening is currently not recommended
- PSA testing is used in ongoing surveillance and management of men with prostate cancer (see [Urology](#), U25)

#### Classification of Recommendations

- A Good** evidence to recommend the clinical preventative action.
- B Fair** evidence to recommend the clinical preventative action.
- C** Existing evidence is **conflicting** and no recommendation is made for or against use of the clinical preventative action; however, other factors may influence decision-making.
- D Fair** evidence to recommend **against** the clinical preventative action.
- E Good** evidence to recommend **against** the clinical preventative action.
- I Insufficient** evidence (in quantity or quality) to make a recommendation; however, other factors may influence decision-making.

# Periodic Health Examination (PHE)

- Canadian Task Force on Preventive Health Care established in 1976, first published in 1979, last updated in 2005
- mandate: to develop and disseminate clinical practice guidelines for primary and preventive care
- recommendations are based on systematic analysis of scientific evidence
  - most notable recommendation is the abolition of the annual physical exam; replaced by the PHE

## Purpose of the PHE

- **primary prevention:** identify risk factors for common diseases; counsel patients to promote healthy behaviour
- **secondary prevention:** presymptomatic detection of disease to allow early treatment and to prevent disease progression
- update clinical data
- enhance patient-physician relationship

Table 1. Periodic Health Exam

Reference: Canadian Task Force on Preventative Health Care, 2005

**Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review**

*Int J Gynecol Cancer* 2009;19:1166-1176  
**Study:** Systematic review of 6 randomized placebo-controlled double-blind trials.

**Patients:** 47,236 women between ages 9-26.  
**Intervention:** Vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form vs. placebo.

**Main Outcome:** Prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma in situ of the cervix, or cancer of the cervix associated with HPV infection).

**Results:** Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% and 62%, respectively.

**Prostate-Cancer Mortality at 11 Years of Follow-up**

*NEJM* 2012;366:981-990

**Study:** Updated "ERSPC" study – multicentre randomized trial of screening for prostate cancer using PSA.

**Patients:** 162,388 men, ages 55-69 from 8 different European countries.

**Intervention:** PSA-based screening.

**Main Outcome:** mortality from prostate cancer.

**Results:** After median follow up of 11 yr, the RRR of death from prostate cancer was 21%. The ARR was 1.07 deaths/1000 men. NNT=1055 – therefore to prevent one death from prostate cancer at 11 yr follow up, 1055 men would need to be screened.

**Folic Acid Supplementation in Pregnancy (Joint SOGC-Motherisk clinical guideline)**

- To prevent neural tube defects in all women capable of becoming pregnant
- Low risk women (no personal health risks, planned pregnancy): 0.4-1.0 mg daily folic acid supplementation for at least 2-3 mo before conception and throughout pregnancy and postpartum period

- High risk women (health risks including epilepsy, insulin dependent diabetes, BMI >35, family history of NTD, high risk ethnic group): at least 3 mo prior to conception until 10-12 wk post conception: daily supplementation with multivitamins with 5 mg folic acid
- From wk 12 post-conception until postpartum period: 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no birth control, additional teratogenic substances): higher folic acid dose of 5 mg

**Appropriate Use of Screening and Diagnostic Tests to Foster High-Value, Cost-Conscious Care**

*Ann Intern Med* 2012;156:147-149  
**Suggested principles for providing high-value, cost-conscious care (see article Table 1 for specific examples):**

- Diagnostic tests should not be performed if the results will not change management.
- When the pretest probability of disease is low, the likelihood of a false-positive test result is higher than the likelihood of a true-positive result. False-positive results often lead to further testing, which may be expensive and potentially harmful (e.g. anxiety for patient, inappropriate treatment).
- The true cost of a test includes not only the cost of the test itself but also the downstream costs incurred because the test was performed. These include the costs of subsequent testing, treatment, or follow-up.

## Breast Cancer Screening Guidelines

### 2011 Recommendations on screening for breast cancer in average-risk women (The Canadian Task Force on Preventative Health Care)(Weak recommendations with low-moderate quality evidence)

- average-risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the *BRCA1/BRCA2* genes or previous exposures of the chest wall to radiation

#### Mammography

- age 40-49: no routine screening
- age 50-69: routine screening q2-3yr
- age 70-74: routine screening q2-3yr

#### Magnetic Resonance Imaging (MRI)

- no routine screening with MRI scans

#### Clinical Breast Examination (CBE)

- no routine CBE alone or in conjunction with mammography to screen for breast cancer

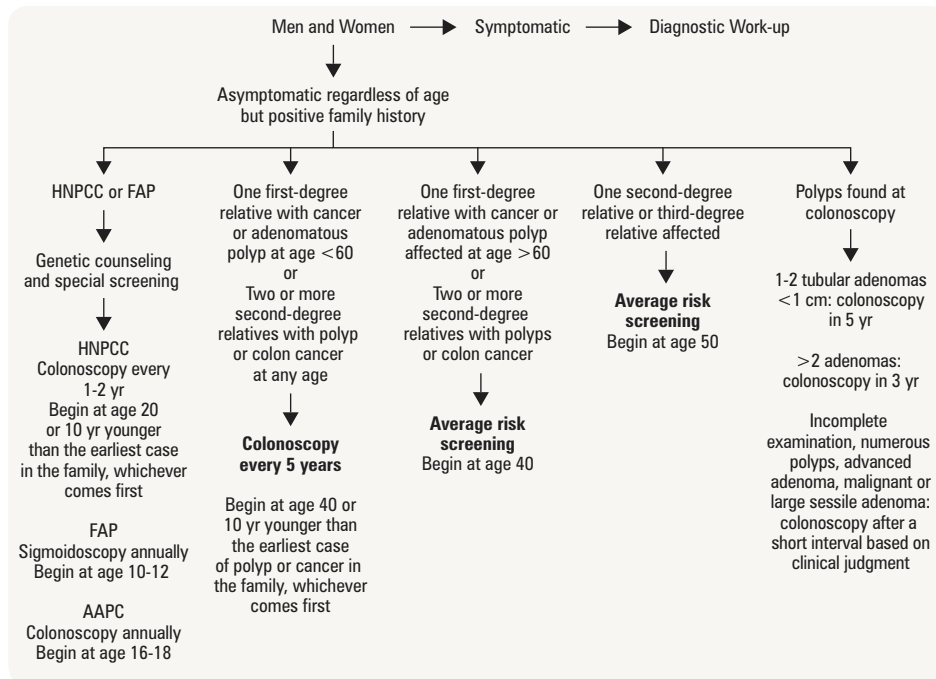

#### Breast self-examination

- recommend not advising women to routinely practice breast self-examination

## Colorectal Cancer Screening Guidelines

- recommendations for average risk individuals (asymptomatic, no history of UC, polyps, or CRC):
  - Canadian Association of Gastroenterology (2010):
    - FOBT q1-2yr
    - flexible sigmoidoscopy q10yr
    - flexible sigmoidoscopy + FOBT q5yr
    - for UC patients, colonoscopy q1-2yr after 8 yr of disease

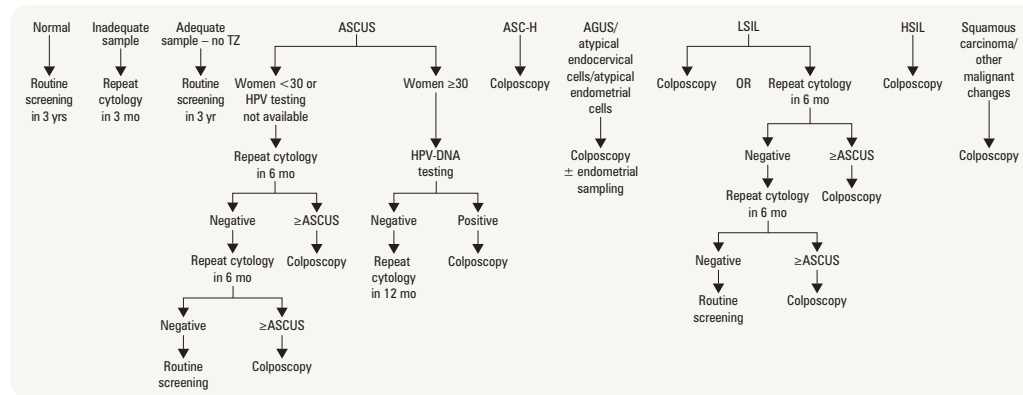

**Figure 1. Approach to higher risk screening**

AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins

Printed with permission from Can J Gastroenterol 2004;18:93-99

## Cervical Cancer Screening

- either conventional Papanicolaou (Pap) smear or liquid based cytology testing
- endocervical and exocervical cell sampling (aim is to sample the transitional zone)
- best identifies squamous cell abnormalities, less reliable for glandular abnormalities
  - false positives 5-10%, false negatives 10-40% (for single test)
  - false negative rate 50% for existing cervical cancer
- cervical cancer screening guidelines differ by Canadian jurisdiction (see The Society of Obstetricians and Gynaecologists of Canada updated guidelines)
- Canadian guidelines:**
  - screen all women age  $\geq 25$  q3yr
  - women age  $\geq 70$ : if 3 normal tests in a row and no abnormal tests in last 10 yr, can discontinue screening
- Ontario guidelines:**
  - screen all women age  $\geq 21$  who are or have ever been sexually active (includes intercourse or digital/oral activity with partner of either gender)
  - if cytology is normal, can screen every 3 yr
  - women age  $\geq 70$ : if 3 successive negative Pap tests in last 10 yr, can discontinue screening
- pregnant women and women who have sex with women should follow the routine cervical screening regimen
- women who have had a hysterectomy:
  - total: discontinue screening if hysterectomy was for benign disease and no history of cervical dysplasia or HPV infection
  - subtotal: continue screening according to guidelines
- exceptions to guidelines:
  - immunocompromised (transplant, steroids, diethylstilbestrol exposure, HIV)
  - adolescent women
  - previously unscreened patients

**Figure 2. Decision making chart for cervical cancer screening (not applicable for adolescents)**

TZ = transitional zone; ASCUS = abnormal squamous cells of unknown significance; LSIL = low grade squamous intraepithelial lesion; HSIL = high grade squamous intraepithelial lesion; ASC-H = abnormal squamous cells cannot rule out HSIL; AGUS = atypical glandular cells of unknown significance  
Adapted from Ontario Cervical Screening Cytology Guidelines. May 2012

## Health Promotion and Counselling

- health promotion is the most effective preventative strategy
- 40-70% of productive life lost annually is preventable
- there are several effective ways to promote healthy behavioural change, such as discussions appropriate to a patient's present stage of change

## Motivational Strategies for Behavioural Change

**Table 2. Motivational Strategies for Behavioural Change**

Patient's Stage of Change	Physician's Aim	Physician's Plan
<b>Pre-contemplation</b>	Encourage patient to consider the possibility of change Assess readiness for change Increase patient's awareness of the problem and its risks	Raise issue in a sensitive manner Offer (not impose) a neutral exchange of information to avoid resistance
<b>Contemplation</b>	Understand patient's ambivalence and encourage change Build confidence and gain commitment to change	Offer opportunity to discuss pros and cons of change using reflective listening
<b>Preparation</b>	Explore options and choose course most appropriate to patient Identify high-risk situations and develop strategies to prevent relapse Continue to strengthen confidence and commitment	Offer realistic options for change and opportunity to discuss inevitable difficulties
<b>Action</b>	Help patients design rewards for success Develop strategies to prevent relapse Support and reinforce convictions towards long-term change	Offer positive reinforcement and explore ways of coping with obstacles Encourage self-rewards to positively reinforce change
<b>Maintenance</b>	Help patient maintain motivation Review identified high-risk situations and strategies for preventing relapse	Discuss progress and signs of impending relapse
<b>Relapse</b>	Help patient view relapse as a learning experience Provide support appropriate to present level of readiness post-relapse	Offer a non-judgmental discussion about circumstances surrounding relapse and how to avoid relapse in the future Reassess patient's readiness to change

Adapted from Hunt P. Motivating Change. Nursing Standard 2001;16:45-52, 54-55

## Nutrition

### General Population

- Canada's Food Guide is appropriate for individuals age ≥2
- counsel on variety, portion size, and plate layout (see Figure 3)

**Table 3. Canada's Food Guide 2007 Recommendations for Adults**

Food Group	Servings/day	Choose More Often
Grain products	6-8	Whole grain and enriched grain products
Vegetables and fruit	7-10	Dark green vegetables, orange vegetables and fruit
Milk products	2-3 Children age 2-8: 2 Youth age 9-18: 3-4 Pregnant/breastfeeding: 3-4	Lower-fat dairy products
Meat and alternatives	2-3	Lean meat, poultry, fish, peas, beans, lentils

**Figure 3. Plate layout**

## Cardiovascular Disease Prevention

**Table 4. Dietary Guidelines for Reducing Risk of Cardiovascular Disease in General Population**

Food Item	Recommendations	Effects
<b>Fat</b>	Fat intake <30% of total energy Saturated fat <7% of total energy Trans fat <1% of total energy Cholesterol <300 mg/d	Lower LDL
<b>Omega-3 fatty acid rich foods</b>	≥2 servings/wk of fish (esp. oily fish like salmon)	Decreased sudden death, death from CAD Lower TG
<b>Salt</b>	≤2300 g/d	Lower BP
<b>Alcohol</b>	≤2 drinks/d for men ≤1 drink/d for women	Decreased risk of hypertriglyceridemia, HTN

References: Canada's Food Guide to Healthy Eating. Health Canada. Last updated 2007. <http://www.hc-sc.gc.ca/fn-an/food-guide-aliment/>  
Lichtenstein AH, et al. Diet and lifestyle recommendations revision 2006: A scientific statement from the American Heart Association Nutrition Committee. Circulation 2006;114:82-96

**Table 5. Introduction to Vitamins and Minerals**

Vitamin/Mineral	Dietary Source	Signs of Deficiency	Signs of Toxicity
<b>Folate (vit B<sub>9</sub>)</b>	Green leafy vegetables, organ meats, dried yeast, dried beans, legumes, citrus, fortified grains	Macrocytic anemia, diarrhea, glossitis, lethargy, stomatitis <b>Very rare in Canada due to fortification of bread</b>	None known from foods, seizures
<b>Cyanocobalamin (vit B<sub>12</sub>)</b>	Organ meats, beef, pork, milk, cheese, fish	Megaloblastic anemia, glossitis, leukopenia, weakness, peripheral neuropathy (esp. foot drop)	None known from foods
<b>Ascorbic acid (vit C)</b>	Citrus fruits, tomatoes, potatoes, red berries, peppers	Scurvy, keratosis of hair follicles, impaired wound healing, anemia, depression, lethargy, bleeding	Osmotic diarrhea, N/V, oxalate kidney stones, interference with anticoagulation therapy
<b>Vitamin A</b>	Fish liver oils, egg yolk, dairy products, green leafy or orange/yellow vegetables and fruit	Dermatitis, night blindness, keratomalacia, xerophthalmia	N/V, headache, dizziness, deep bone pain, peeling skin, gingivitis, alopecia, hepatotoxicity
<b>Vitamin D</b>	Fish, fish liver oils, fortified milk, egg yolk, sunlight	Osteoporosis, osteomalacia, muscle weakness, bone pain, hypophosphatemia, hypocalcemia	Excess bone and soft tissue calcification, kidney stones, hypercalcemia, anorexia, renal failure
<b>Vitamin E</b>	Polyunsaturated vegetable oils, nuts, eggs, wheat germ, whole grains	Rare hemolysis, anemia, neuronal axonopathy, myopathy	Prolonged clotting time, impaired neutrophil function
<b>Vitamin K</b>	Green leafy vegetables, liver, vegetable oils, intestinal flora	Bleeding, purpura, bruising, prolonged clotting time	Jaundice
<b>Calcium</b>	Dairy products, dark, green and leafy vegetables, fortified soy, fortified orange juice	Tetany, arrhythmias, congestive heart failure, altered nerve conduction, osteomalacia	Metastatic calcification, weakness, renal failure, psychosis
<b>Magnesium</b>	Soy, clams, wheat germ, almonds, dairy products, green leaves, nuts, cereal grains, seafood	Weakness, convulsions, neuromuscular irritability and dysfunction, failure to thrive	Hypotension, cardiac disturbances, respiratory failure
<b>Potassium</b>	Meat, milk, bananas, prunes, raisins, oranges, grapefruits, potatoes, legumes	Polyuria, impaired muscle contraction, ECG changes (prolonged QT interval, prominent U-waves), peritoneal distention, dyspnea, paralysis, cardiac disturbances	Mental confusion, hypotension, weakness, ECG changes (flattened P-waves, wide QRS, peaked T-waves), paralysis, cardiac disturbances
<b>Iron</b>	Meat, fish, poultry, organ meats, eggs, prunes, peas, beans, lentils, soy, raisins, fortified grain products	Glossitis, fatigue, tachycardia, microcytic hypochromic anemia, koilonychia, enteropathy	Nutritional hemosiderosis, organ damage

Adapted from Mosby's Family Practice Sourcebook: An Evidence-Based Approach to Care, 4th edition, edited by Dr. Michael Evans (pp. 343-345). Copyright © 2006 Elsevier Canada, a division of Reed Elsevier Canada, Ltd. All rights reserved. Reprinted by permission of Elsevier Canada, 2009

### Handy Serving Size Comparisons

- 3 oz meat, fish, poultry → palm of hand
- 1 cup dairy (milk/yogurt) → size of fist
- Bread/grains → one slice, palm of hand
- ½ cup rice/pasta → one hand cupped
- 1 cup of fruit/vegetables → two cupped hands
- 1 oz cheese → full length of thumb
- 1 tsp oil/butter → tip of thumb
- Nuts/chips/snacks → palm covered

### Energy Content of Food

- Carbohydrates 4 kcal/g
- Protein 4 kcal/g
- Fat 9 kcal/g
- Ethanol 7 kcal/g

### Calculating Total Daily Energy Expenditure (TDEE)

- Roughly 35 kcal/kg/d
- Varies by age, weight, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

### Canadian Cancer Society (CCS) Recommendations for Vitamin D Use

- Based on CCS research on Vitamin D and the prevention of colorectal, breast and prostate cancer
- In consultation with their healthcare provider, the Society is recommending that:
  - Adults living in Canada should consider taking Vitamin D supplementation of 1,000 international units (IU) a day during the fall and winter
  - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1,000 IU/d all year round. This includes people: who are older, with dark skin, who don't go outside often, and who wear clothing that covers most of their skin

### Osteoporosis Canada Recommendations for Calcium and Vitamin D Daily Requirements:

- Vitamin D: 400-800 IU for individuals age <50, 800-2000 IU for individuals age ≥50
- Calcium: 1200 mg daily from all sources for individuals age ≥50

**Table 6. Macronutrient Distribution Ranges**

Age (yr)	Macronutrient as % of Daily Calories		
	Protein	Fat	Carbohydrate
1 to 3	5-20	30-40	45-65
4 to 18	10-30	25-35	45-65
19 and older	10-35	20-35	45-65

Adapted from Dietary Reference Intakes Tables, Health Canada. [http://www.hc-sc.gc.ca/fn-an/nutrition/reference/table/index\\_e.html](http://www.hc-sc.gc.ca/fn-an/nutrition/reference/table/index_e.html)

**Burning Fat**

3500 kcal of energy are used for every pound of human fat burned during activity.

**Losing Weight**

- Aim for caloric intake 500-1000 kcal/d less than total daily energy expenditure (TDEE)
- Results in 1-2 lb (0.5-1 kg) weight loss per wk
- Achieved by combination of increased activity and/or decreased caloric intake

**Low BMI is associated with:**

- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

**Adverse Medical Consequences of Obesity**

- Type 2 DM
- CAD
- Stroke
- HTN
- Gallbladder disease
- Non-alcoholic steatohepatitis
- Complications of pregnancy
- Dyslipidemia
- Osteoarthritis
- Sleep apnea
- Certain cancers
- CHF
- Low back pain
- Increased total mortality

## Obesity

- body mass index (BMI) = weight (kg)/height (m)<sup>2</sup> = weight (lbs)/height (inch)<sup>2</sup> x 703; BMI is a poor predictor of obesity
- waist circumference (WC)
  - should be measured in all adults to assess obesity-related health risks
  - specific cutoff points exist for different ethnic backgrounds (as recommended by the 2006 Canadian Clinical Practice Guidelines on obesity)
  - measurement of waist-hip ratio has no advantage over waist circumference alone

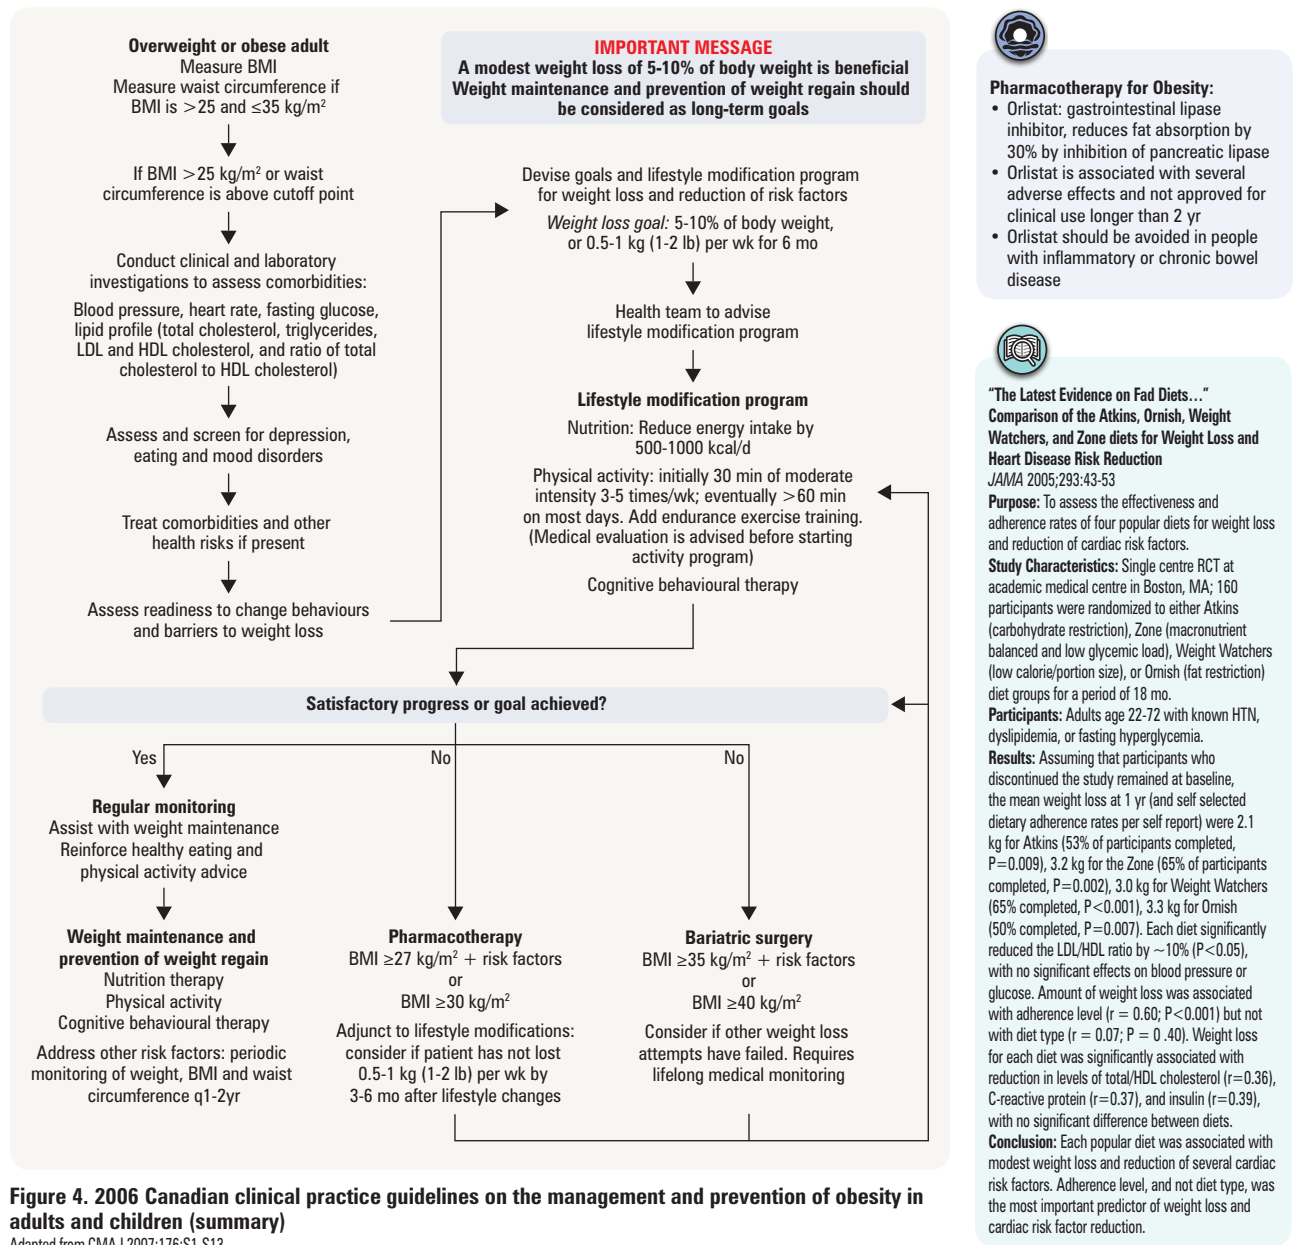

**Table 7. Classification of Weight by BMI, Waist Circumference, and Associated Disease Risks in Adults**

	BMI (kg/m <sup>2</sup> )	Obesity Class	Men ≤102 cm (40 in) Women ≤88 cm (35 in)	Men >102 cm (40 in) Women >88 cm (35 in)
Underweight	<18.5			
Normal	18.5-24.9			
Overweight	25.0-29.9		Increased	High
Obesity	30.0-34.9	I	High	Very High
	35.0-39.9	II	Very High	Very High
Extreme Obesity	40.0 +	III	Extremely High	Extremely High

From: Classification of Overweight and Obesity by BMI, Waist Circumference, and Associated Disease Risks, National Institute of Health, National Heart Lung and Blood Institute, Obesity Education Initiative, [http://www.nhlbi.nih.gov/health/public/heart/obesity/lose\\_wt/bmi\\_dis.htm](http://www.nhlbi.nih.gov/health/public/heart/obesity/lose_wt/bmi_dis.htm)

### Epidemiology

- 16% (4 million) of people ≥18 yr old are obese, 32% (8 million) are overweight in Canada, according to StatsCan (2007)
- obesity rate in people of aboriginal origin is 1.6 times higher than the national average
- proportion of children aged 6-11 who are overweight has more than doubled in the last 25 yr; percentage of overweight adolescents has tripled
- overweight and obesity rates in children are directly proportional to screen time (see *Exercise*, FM10)
- only 10-15% of population consume <30% fat daily
- obese persons generally consume more energy-dense food which tends to be highly processed, micronutrient poor, and high in fats, sugars, or starch

**Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children (summary)**

Adapted from CMAJ 2007;176:S1-S13

## Dyslipidemia

- see [Endocrinology](#), E2
- defined as abnormal elevation of plasma cholesterol or triglyceride levels
- increased risk associated with obesity, DM, alcohol use

### Assessment

- measure fasting serum TC, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males over age 40, females over age 50 or who are menopausal, or any adults with additional CAD risk factors
- assess for presence of other CAD risk factors
- screen for secondary causes: hypothyroidism, chronic kidney disease, DM, nephrotic syndrome, liver disease
- risk category
  - estimate using the model for 10-yr CAD risk developed from the Framingham data (Framingham Risk Score – FRS)
    - FRS calculated based on the following factors: gender, age, HDL-C, total cholesterol, sBP, smoking, diabetes
      - to be completed for men age 40-75, and women age 50-75 q3-5yr

### Hyperlipidemia Signs

- Atheromata: plaques in blood vessel walls
- Xanthoma: plaques or nodules composed of lipid-laden histiocytes in the skin (especially the eyelids)
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Corneal arcus (arcus senilis): lipid deposit in cornea

LDL cannot be calculated when TG  $\geq 4.5$  mmol/L.

- ♦ cardiovascular age calculated as patient's age  $\pm$  the difference between his or her estimated remaining life expectancy
  - used to increase adherence to therapy and reaffirm positive effect of following therapy
- primary target of therapy is LDL-C levels; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C (not used widely yet) (see Table 8)
- optional secondary targets once LDL-C/apo B is at target include TC:HDL-C ratio, apo B:apo AI ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C and serum TG levels
- emerging risk factors (from Framingham group)
  - lipoprotein a
  - metabolic syndrome
  - genetic risk
  - hormone replacement therapy
  - infectious agents

**Table 8. Target Lipid Values for Primary Prevention of CAD (2012 Canadian Cholesterol Guidelines)**

Risk Category	Initiate Treatment if:	Primary Targets	
		LDL-C	Alternate
High (FRS $\geq 20\%$ , or history of DM, CAD, PVD, atherosclerosis)	Consider treatment in all patients	<2 mmol/L or $\geq 50\%$ decrease in LDL-C	apo B <0.80 g/L $\leq 2.6$ mmol/L
Moderate (FRS 10-19%)	LDL-C $\geq 3.5$ mmol/L For LDL-C <3.5 consider if: apo B $\geq 1.2$ g/L or non-HDL-C $\geq 4$ mmol/L	<2 mmol/L or $\geq 50\%$ decrease in LDL-C	apo B <0.80 g/L non HDL-C $\leq 2.6$ mmol/L
Low (FRS $\leq 10\%$ )	LDL-C $\geq 5.0$ mmol/L Familial hypercholesterolemia	$\geq 50\%$ decrease in LDL-C	

Anderson TJ, et al. 2012 Update of the Canadian Cardiovascular Society Guidelines for the Diagnosis and Treatment of Dyslipidemia and Prevention of Cardiovascular Disease in the Adult. Can J Cardiol 2013; 29:151-167

## Management

- intensity and type of treatment is guided by “risk category” assigned
- 1. health behaviours (can decrease LDL-C by up to 10%)
  - smoking cessation: probably the most important for preventing CAD
  - dietary modification: reduce saturated fats, refined sugars, alcohol; increase fruits, vegetables and fibres
  - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk
  - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patient should start treatment immediately with concurrent health behaviour interventions
- 2. pharmacologic therapy (can decrease LDL-C by up to 40%)
  - for a comparison of dyslipidemia medications, see [Endocrinology](#), E5
  - statins (HMG-CoA reductase inhibitors)
    - ♦ currently recommended as 1<sup>st</sup> line monotherapy following unsuccessful lifestyle modifications
    - ♦ risks: myopathy and hepatotoxicity – must follow LFTs q6-12mo
  - other agents: bile acid sequestrants, nicotinic acid, fibrates, psyllium, cholesterol absorption inhibitors (e.g. ezetimibe)
- after initiating drug therapy
  - monitor ALT, AST, CK at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal (2-3 times upper limit of normal if symptomatic), or serum creatinine of  $\leq 25\%$ ; repeat ALT, AST and CK with lipid bloodwork
  - fasting lipids should be measured at 3 mo
  - if adequate response is achieved, evaluate fasting lipids q6-12mo
- isolated hypertriglyceridemia (does not increase your cardiovascular risk!)
  - normal HDL-C and TC, elevated TG
  - mild  $\geq 2.2$  mmol/L ( $\geq 200$  mg/dL); marked  $\geq 5.6$  mmol/L ( $\geq 500$  mg/dL)
  - principal therapy is lifestyle modification
    - ♦ weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics, increased omega-3 fatty acid intake
  - drug therapy
    - ♦ nicotinic acid
    - ♦ fibrates

### Clinical Definition of Metabolic Syndrome

- Central obesity:
  - Men – waist circumference  $\geq 94$  cm
  - Women – waist circumference  $\geq 80$  cm
- Plus any TWO of the following four factors:

Risk Factor	Defining Level
TG level	$\geq 1.7$ mmol/L (150 mg/dL)
HDL-C level:	
Men	<1.0 mmol/L (40 mg/dL)
Women	<1.3 mmol/L (50 mg/dL)
Blood pressure	$\geq 130/85$ mmHg
Fasting glucose level	$\geq 5.6$ mmol/L (100 mg/dL)

To calculate Framingham Risk Score, go to <http://www.framinghamheartstudy.org/risk-functions/cardiovascular-disease/10-year-risk.php#>

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations.

### Statin-Related Adverse Events: A Meta-analysis

*Clin Ther* 2006;28:26-35

**Study:** Meta-analysis of 18 RCTs (N=71,108) focused on adverse effects of statins.

**Patients:** Those taking statin monotherapy for primary or secondary prevention of CVD.

**Intervention:** Statin vs. placebo.

**Main outcome:** Adverse events (AE) including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis).

**Results:** Statin therapy increased the risk of any AE by 39% (OR = 1.4; 95% CI, 1.09-1.80; P = 0.008) compared with placebo. Treating 1000 patients with a statin would cause 5 AE. Serious events (CK > 10 times the upper limit of normal or rhabdomyolysis) are infrequent (NNH = 3400) and rhabdomyolysis, although serious, is rare (NNH = 7428).

**Conclusion:** Statin therapy was associated with greater odds of AEs compared with placebo but with substantial clinical benefit. Similar rates of serious AEs were observed between statin and placebo.

### The Benefits of Statins in People without Established Cardiovascular Disease but with Cardiovascular Risk Factors: Meta-Analysis of Randomized Controlled Trials

*Brit Med J* 2009;338:b2376

**Study:** Meta-analysis of 10 RCTs.

**Population:** 70,388 participants (minimum of 80% without established cardiovascular (CV) disease).

**Intervention:** Statins, placebo, active control, usual care.

**Main outcome:** All-cause mortality. Other outcomes: major coronary events, major cerebrovascular events.

**Results:** Statin use significantly reduced the incidence of all-cause mortality (OR 0.88; 95% CI 0.81-0.96), major coronary events (OR 0.70; 95% CI 0.61-0.81) and major cerebrovascular events (OR 0.81; 95% CI 0.71-0.93).

**Conclusion:** Statins largely reduce the risk of major CV events and improve survival in patients with CV risk factors without established CV disease.

## Exercise

### Epidemiology

- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary
- screen time (time spent watching TV/movies, playing video games, or using the computer) has been increasing steadily in the last several yr, while time spent being physically active has been decreasing
- current recommendation from international pediatric societies is that children (>2 yr old) should limit their screen time to less than 2 h/d

### Management

- assess current level of fitness, motivation and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, diabetes (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- Canadian Physical Activity Guidelines for adults age 18-64 (ParticipACTION)
  - ≥150 min of moderate- to vigorous-intensity aerobic physical activity per wk, in bouts of ≥10 min
    - ♦ moderate-intensity: brisk walking, bike riding
    - ♦ vigorous-intensity: jogging, cross-country skiing
  - muscle and bone strengthening activities using major muscle groups, ≥2 d/wk
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 diabetes, osteoporosis, overweight/obesity
  - leads to improved fitness, strength, and mental health (morale and self-esteem)

## Smoking Cessation

### Epidemiology

- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2008 Canadian data from the Canadian Tobacco Use Monitoring Survey (CTUMS) on population age 15 or older
  - 18% are current smokers (lowest since 1965)
  - highest prevalence in age group 20-24 (28%)
  - 15% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing

### Management

- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts and results
  - every smoker should be offered treatment
  - make patient aware of withdrawal symptoms
    - ♦ low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
  - ≥4 counselling sessions >10 min each with 6-12 mo follow-up yields better results
  - 14% abstinent with counselling vs. 10% without counselling
  - approach depends on patient's stage of change (see *Motivational Strategies for Behavioural Change*, FM5)
- willing to quit
  - follow the 5 As (see sidebar)
  - provision of social support, community resources
  - pregnant patients: advise to quit first without pharmacotherapy. Nicotine replacement therapy (NRT) should be made available to pregnant women who are unable to quit using non-pharmacologic methods; nicotine patches are strongly encouraged. Use bupropion (no evidence of fetal or reproductive harm) only if benefits > risks; consult Motherisk. Varenicline has not been studied in pregnancy and should not be used in pregnant women
- pharmacologic therapy
  1. nicotine replacement therapy
    - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
    - no difference in achieving abstinence for different forms of NRT
    - reduces cravings and withdrawal symptoms without other harmful substances that are contained in cigarettes
    - use with caution: immediate post-MI, serious/worsening angina, serious arrhythmia

#### Physician Advice for Smoking Cessation

*Cochrane DB Syst Rev* 2008;2:CD000165

This systematic review of 17 trials compared brief advice by the physician versus no advice.

**Reviewers' conclusions:** Simple advice can increase cessation rates by 1-3%. More intensive advice and providing follow-up support may further increase the quit rates.

#### Assist Patient in Developing Quit Plan

##### STAR

**Set** quit date

**Tell** family and friends (for support)

**Anticipate** challenges (e.g. withdrawal)

**Remove** tobacco-related products (e.g. ashtrays/lighters)

#### The 5 As for Patients Willing to Quit

**Ask** if patient smokes

**Advise** patient to quit

**Assess** willingness to quit

**Assist** in quit attempt

**Arrange** follow-up

2. Bupropion SR (Zyban®)
  - 21% abstinent at 12 mo vs. 8% for placebo
3. Varenicline (Champix®)
  - partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
  - more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% for bupropion vs. 9% with placebo)

**Table 9. Types of Nicotine Replacement Therapy**

Type	Dosage	Comment	Side Effects
<b>Nicotine Gum (OTC)</b>	2 mg if <25 cig/d 4 mg if >25 cig/d 1 piece q1-2h for 1-3 mo (max 24 pieces/d)	Chew until "peppery" taste then "park" between gum and cheek to facilitate absorption Continue to chew-park intermittently for 30 min	Mouth soreness Hiccups Dyspepsia Jaw ache Most are transient
<b>Nicotine Patch (OTC)</b>	Use for 8 wk 21 mg/d x 4 wk 14 mg/d x 2 wk 7 mg/d x 2 wk	Start with lower dose if <10 cig/d Change patch q24h and alternate sides	Skin irritation Insomnia Palpitations Anxiety
<b>Nicotine Inhaler (OTC)</b>	6-16 cartridges/d for up to 12 wk	Nicotine inhaled through mouth, absorbed in mouth and throat not in lungs	Local irritation Coughing
<b>Nicotine Nasal Spray (Rx)</b>		Newer form of NRT	Local irritation, coughing

**Table 10. Bupropion as Treatment for Smoking Cessation**

Mechanism	Dosage	Prescribing*	Contraindications
Inhibits re-uptake of dopamine and/or norepinephrine • Side effects: insomnia, dry mouth	1. 150 mg qAM x 3 d 2. Then 150 mg bid x 7-12 wk 3. For maintenance consider 150 mg bid for up to 6 mo	1. Decide on a quit date 2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk)	Seizure disorder Eating disorder MAOI use in past 14 d Simultaneous use of bupropion (Wellbutrin®) for depression

\*May be used in combination with nicotine replacement therapy

**Table 11. Varenicline as Treatment for Smoking Cessation**

Mechanism	Dosage	Prescribing*	Contraindications
Partial nicotinic receptor agonist, and partial nicotinic receptor competitive antagonist • Side effects: nausea, vomiting, constipation, headache, dream disorder, insomnia, increased risk of psychosis, depression, suicidal ideation	1. 0.5 mg qAM x 3 d 2. Then 0.5 mg bid x 4 d 3. Continue 1 mg bid x 12 wk ± additional 12 wk as maintenance	1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop	Caution with pre-existing psychiatric condition

\*May be used in combination with nicotine replacement therapy

- unwilling to quit
  - motivational intervention (5 Rs) (see sidebar):
    1. Relevance to patient
      - ♦ relevant to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
    2. Risks of smoking
      - ♦ short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
      - ♦ long-term: MI, stroke, COPD, lung CA, other cancers
      - ♦ environmental: higher risk in spouse/children for lung CA, SIDS, asthma, respiratory infections
    3. Rewards: benefits
      - ♦ improved health, save money, food tastes better, good example to children
    4. Roadblocks: obstacles
      - ♦ fear of withdrawal, weight gain, failure, lack of support
    5. Repetition
      - ♦ reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)

#### Nicotine Replacement Therapy for Smoking Cessation

*Cochrane DB Syst Rev* 2008;1:CD000146  
This systematic review of 132 randomized trials compared NRT to placebo or no treatment or compared different NRT doses.

**Reviewers' conclusions:** All commercially available forms of NRT (gum, transdermal patch, nasal spray, inhaler and sublingual tablets/lozenges) are effective as part of a strategy to promote smoking cessation. They increase the rate of quitting by 50-70% regardless of setting and independent on the level of additional support provided to the smoker. Compared to a single form of NRT, combining a nicotine patch with a rapid delivery form of NRT may be more effective.

#### Antidepressants for Smoking Cessation

*Cochrane DB Syst Rev* 2007;1:CD000031  
This systematic review of 66 randomized trials compared antidepressant medication to placebo or alternative pharmacotherapy for smoking cessation and where follow-up was longer than 6 mo.

**Reviewers' conclusions:** The antidepressants bupropion and nortriptyline can aid smoking cessation and have a similar efficacy to NRT. Compared to bupropion, varenicline showed higher quit rates. SSRIs (e.g. fluoxetine) or venlafaxine did not have a significant effect.

#### The 2-3 Pattern of Smoking Cessation

- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

#### The 5 Rs for Patients Unwilling to Quit

**Relevance to patient** (health concerns, family/social situations)  
**Risks of smoking**  
**Rewards of quitting**  
**Roadblocks to quitting**  
**Repetition of motivational intervention at each visit**

- recent quitter
  - highest relapse rate within 3 mo of quitting
    - ♦ minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
    - ♦ prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

## Alcohol

- see [Psychiatry](#), PS22

### Definition

- diagnostic categories occur along a continuum (see Figure 5)

### Epidemiology

- 10-15% of patients in family practice are problem drinkers
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women, elderly, patients with high socioeconomic status

### Assessment

- screen for alcohol dependence with CAGE questionnaire (see sidebar)
  - if CAGE positive, explore with further questions for alcohol abuse/dependence
- assess drinking profile
  - setting, time, place, occasion, with whom
  - impact on: family, work, social
  - quantity-frequency history
    - ♦ how many drinks per day?
    - ♦ how many days per week?
    - ♦ maximum number of drinks on any one day in the past month?
- if identified positive for alcohol problem
  - screen for other drug use
  - identify medical/psychiatric complications
  - ask about drinking and driving
  - ask about past recovery attempts and current readiness for change

### Investigations

- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

### Management

- intervention should be consistent with patient's motivation for change
- regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-steps program
  - outpatient/day programs for those with chronic, resistant problems
  - family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
- in-patient program if
  - dangerous or highly unstable home environment
  - severe medical/psychiatric problem
  - addiction to drug that may require in-patient detoxification
  - refractory to other treatment programs
- pharmacologic
  - diazepam for withdrawal
  - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, nausea/vomiting, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  - naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
    - ♦ may trigger withdrawal in opioid-dependent patients

### Prognosis

- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of abusers exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

Figure 5. Continuum of alcohol use

#### Standard Drink Equivalents

- One standard drink = 14 g of pure alcohol
- Beer (5% alcohol) = 12 oz
  - Wine (12-17% alcohol) = 5 oz
  - Fortified wine = 3 oz
  - Hard liquor (80 proof) = 1.5 oz

#### CAGE Questionnaire

- C** Have you ever felt the need to **CUT** down on your drinking?
- A** Have you ever felt **ANNOYED** at criticism of your drinking?
- G** Have you ever felt **GUILTY** about your drinking?
- E** Have you ever had a drink first thing in the morning to steady your nerves or get rid of a hangover? (**EYE OPENER**)

≥2 for men or ≥1 for women suggests possibility of problem drinking (sensitivity 85%, specificity 89%)

#### Alcohol Metabolized per Hour

- Alcohol metabolism is constant (zero-order kinetics) regardless of blood alcohol level (BAL)
- Average metabolism ranges between 13-25 mg/dL blood/h or 100-200 mg/kg/h
- Equivalent to metabolizing 0.5-1 standard drink per hour or BAL decrease of 0.01% per hour
- Metabolism more rapid in chronic alcoholics

#### Some Adverse Medical Consequences of Problem Drinking

- GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
- Cardiac: hypertension, alcoholic cardiomyopathy
- Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
- Hematologic: anemia, coagulopathies
- Other: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

# Common Presenting Problems

## Abdominal Pain

- see [Gastroenterology](#), G4 and [General Surgery](#), GS4

### Epidemiology

- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

### Etiology

- most common diagnosis is “nonspecific abdominal pain,” which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: toxic ingestion, foreign body, psychogenic

### Pathophysiology

- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain
- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon
  - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region

### Investigations

- guided by findings on history and physical
- possible bloodwork: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, tox screen,  $\beta$ -hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - ultrasound (gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT scan (AAA, appendicitis)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - *H. pylori* testing (urea breath test, serology, biopsy)

#### Key Questions on History

- OPQRST
- Location of pain (see [General Surgery](#), GS4)
- Symptoms of peritonitis
- Associated symptoms (nausea, vomiting, fever, chills, weight loss, bowel movements, diarrhea, melena, hematochezia, urinary symptoms)
- Gynecological history (pregnancy, infection, menstrual history, discharge)
- Past surgical history
- Medications (NSAIDs, antibiotics, alcohol)

In patient age > 50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis.

If pain precedes nausea/vomiting, cause of abdominal pain is more likely to be surgical.

#### Abdominal Pain Red Flags:

- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings

## Allergic Rhinitis

- see [Otolaryngology](#), OT23

### Definition

- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification:
  - seasonal
    - ♦ symptoms during a specific time of the year
    - ♦ common allergens: trees, grass and weed pollens, airborne moulds
  - perennial
    - ♦ symptoms throughout the year with variation in severity
    - ♦ common allergens: dust mites, animal dander, moulds

### Etiology

- increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

### Epidemiology

- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, sinusitis, and otitis media

### Assessment

- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

### Management

- conservative
  - minimize exposure to allergens
    - ♦ most important aspect of management, often sufficient (may take months)
  - maintain hygiene, saline nasal rinses
- pharmacologic agents
  - oral antihistamines – first line therapy for mild symptoms
    - ♦ e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  - intranasal corticosteroids for moderate/severe or persistent symptoms (>1 mo of consistent use to see results)
  - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)
- allergy skin testing
  - for patients with chronic rhinitis
  - symptoms not controlled by allergen avoidance, pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

#### Differential Diagnosis

- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

**Rhinitis medicamentosa:** Rebound nasal congestion. Occurs with prolonged use (> 5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect.

## Amenorrhea

- see [Gynecology](#), G12

### Definition and Etiology

- classified as primary or secondary
  - primary
    - ♦ absence of menstruation by age 14 in women without secondary sexual characteristics or absence of menstruation by age 16 in women with secondary sexual characteristics
    - ♦ causes: Turner's syndrome, constitutional delay of growth and puberty, Kallmann syndrome, androgen insensitivity syndrome, Müllerian agenesis, imperforate hymen, transverse vaginal septum, + causes of secondary amenorrhea
  - secondary
    - ♦ absence of menstruation for 3 mo in women with previously normal menstruation, or absence of menstruation for 9 mo in women with previous oligomenorrhea
    - ♦ causes: pregnancy, hypothyroidism, hyperprolactinemia, medications, premature ovarian failure, anorexia or bulimia nervosa, CNS tumour, chronic illness, PCOS

### Assessment

- history
  - menarche and menstrual history, sexual activity, exercise, weight loss, current or previous chronic illness, prescription/illicit drug use, previous CNS chemotherapy or radiation, previous pelvic radiation, psychosocial stressors
  - family history of: genetic defects, infertility, menarche and menstrual history, pubertal history
- physical
  - growth chart, BMI, Tanner staging, dysmorphic features (e.g. webbed neck, short stature), signs of Cushing's disease, thyroid exam, hirsutism or acne, pubic hair pattern, imperforate hymen, absent uterus

### Investigations

- based on clinical picture
- consider  $\beta$ -hCG, prolactin, TSH, progesterone challenge test, FSH and LH levels, pelvic ultrasound, MRI brain, karyotype

## Anxiety

- see [Psychiatry](#), PS13

### Epidemiology

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

### Screening

- screening questions:
  - Do you tend to be an anxious or nervous person?
  - Have you felt unusually worried about things recently?
  - Has this worrying affected your life? How?
- if positive response, follow up with symptom-specific questions (see Figure 6)

### Assessment

- associated symptoms
- risk factors
  - family history of anxiety or depression, past history of anxiety, stressful life event, social isolation, female gender, co-morbid psychiatric diagnosis (e.g. depression)
- assess substance abuse, co-morbid depression, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms and their duration (see Figure 6)

### Differential Diagnosis of Anxiety Disorders (see Figure 6)

- Panic disorder
- GAD
- PTSD
- OCD
- Social phobia
- Specific phobia
- Separation anxiety (children)
- Other: GMC, mood disorder, psychotic disorder

### Rule Out

- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

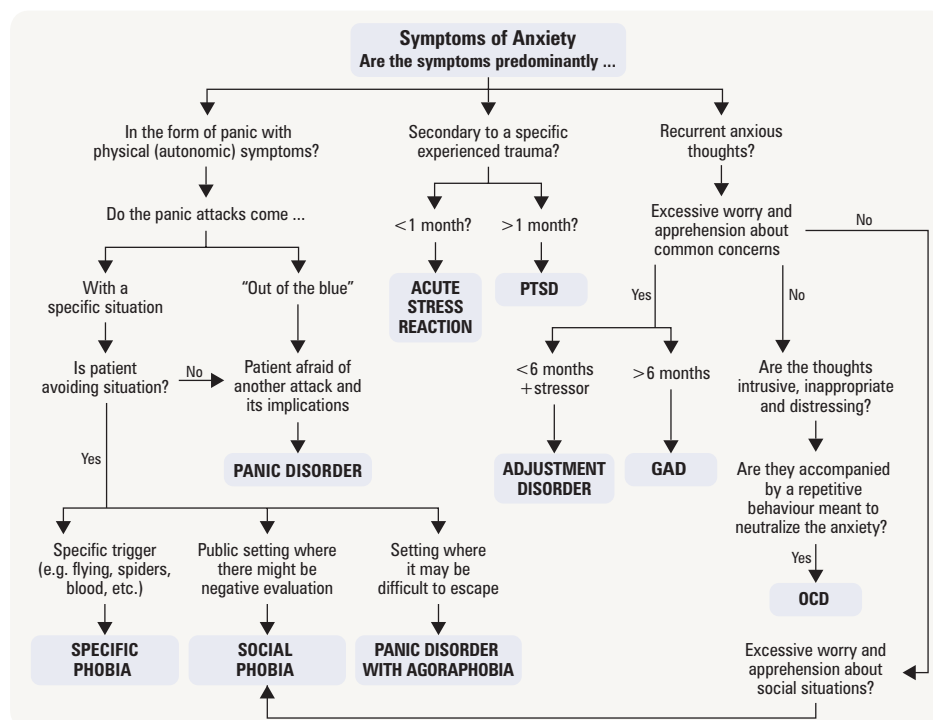

### Symptoms of GAD

#### AND I C REST

- Anxious, nervous, or worried
- No control over the worry
- Duration > 6 mo
- Irritability
- Concentration impairment
- Restlessness
- Energy decreased
- Sleep impairment
- Tension in muscles

Can Fam Physician 2005;51:1340-1342

**Figure 6. Differentiating anxiety disorders**

Adapted from: Evans M, Bradwejn J, Dunn L. Anxiety Review Panel. Guidelines for the treatment of anxiety disorders in primary care. Toronto: Queen's Printer of Ontario, 2000. p41

### Management

- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- lifestyle advice: decrease caffeine and alcohol intake, exercise, relaxation techniques, mindfulness strategies
- self-help materials, community resources (e.g. support groups)
- cognitive behavioural therapy: cognitive interventions, exposure therapy, etc.
- for pharmacotherapy, see [Psychiatry](#), PS48

## Asthma/COPD

- see [Respirology](#), R6

### Definition

- asthma
  - chronic but reversible airway inflammation characterized by periodic attacks of wheezing, shortness of breath, chest tightness, and coughing
  - airways hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucous plugs and increased inflammation
  - cannot be diagnosed at first presentation; called reactive airway disease until recurrent presentations
  - pulmonary function tests (PFTs) can be done from age 6 or when child able to follow instructions to do PFTs
  - peak flow meters are useful in the office and at home for monitoring
- chronic obstructive pulmonary disease (COPD)
  - a group of chronic, progressive, expiratory lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms of COPD

**Table 12. Differentiating COPD from Asthma**

	COPD	Asthma
<b>Age of Onset</b>	Usually in 6th decade	Any age (but 50% of cases diagnosed in children age <10)
<b>Role of Smoking</b>	>10 pack yr	Not causal, known trigger
<b>Reversibility of Airflow Obstruction</b>	Airflow obstruction is chronic and persistent	Airflow obstruction is episodic and usually reversible with therapy
<b>Evolution</b>	Slow, progressive worsening (with periodic exacerbations)	Stable, episodic, less than 50% will outgrow
<b>History of Allergy</b>	Infrequent	Over 50% patients
<b>Precipitators</b>	Environmental irritants (air pollution), cigarette smoking, $\alpha$ -1 antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs)	Environmental irritants (dust, pollen), animal fur, cold air, exercise, URTIs, cigarette smoke, use of $\beta$ -blockers/ASA
<b>Symptoms/Signs</b>	Chronic cough, sputum and/or dyspnea	Wheeze (hallmark symptom), dyspnea, chest tightness, cough which is worse in cold, at night, and in early AM, prolonged expiration
<b>Diffusion Capacity</b>	Decreased (more so in pure emphysema)	Normal (for pure asthma)
<b>Hypoxemia</b>	Chronic in advanced stages	Not usually present Episodic with severe attacks
<b>Spirometry</b>	May have improvement with bronchodilators but not universally seen	Marked improvement with bronchodilators or steroids
<b>Chest X-ray</b>	Often normal Increased bronchial markings (chronic bronchitis) and chronic hyperinflation (emphysema) often co-exist, bullae	Often normal or episodic hyperinflation Hyperinflation during asthma attack
<b>Management</b>	<b>Mild</b> Step 1: SABA prn (salbutamol) Step 2: SABA prn + LAAC (i.e. tiotropium) or + LABA (e.g. salmeterol) <b>Moderate</b> Step 3: SABA prn + LAAC + low-dose combined ICS/LABA; consider inhaled vs. oral steroids <b>Severe</b> Step 4: $\pm$ theophylline Pneumococcal vaccination, annual influenza immunization	Ongoing patient education, and environmental control SABA taken prn as rescue medication + maintenance meds Maintenance medications: Step 1: Low-dose ICS Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LT modifier, or long-acting theophylline Step 3: Medium/high-dose ICS plus either LABA, LT modifier, or long-acting theophylline Step 4: As above plus immunotherapy $\pm$ oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization

SABA = short-acting  $\beta$ -agonist; LAAC = long-acting anticholinergic; LABA = long-acting  $\beta$ -agonist; ICS = inhaled glucocorticosteroids; LT modifier = leukotriene modifier

**Figure 7. Expiratory flow volume curves (obstructive, normal and restrictive disease)**

See also [Respirology](#), R4. Adapted from Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. ©2008.

### What Colour is Your Inhaler?

Name	Body/Cap Colour
<b><math>\beta_2</math>-agonists</b>	
Salbutamol – Ventolin®	light blue/navy
Salmeterol – Serevent®	teal/light teal
Terbutaline – Bricanyl®	blue/white
<b>ICS</b>	
Fluticasone – Flovent®	orange/peach
Budesonide – Pulmicort®	white/brown
<b>Combined long-acting <math>\beta_2</math>-agonist + ICS</b>	
Fluticasone/Salmeterol – purple discus Advair®	purple discus
Budesonide/Formoterol – red/white Symbicort®	red/white
Ipratropium/Albuterol – clear/orange Combivent®	clear/orange
<b>Anticholinergics</b>	
Ipratropium – Atrovent®	clear/green
Tiotropium – Spiriva®	white/turquoise

### More about Inhalers:

- Aerosols (puffers=MDI, MDI + spacer)
  - MDIs should be used with spacers to:
    - Reduce side effects
    - Improve amount inhaled
    - Increase efficiency of use
- Dry powder Inhaler (discus, turbuhaler and diskhaler), they require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

### Differential Diagnosis of Wheezing

- Allergies, anaphylaxis
- Asthma, reactive airway disease
- Gastroesophageal reflux disease
- Infections (bronchitis, pneumonia)
- Obstructive Sleep Apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of **hypokalemia**: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, nausea, vomiting, polyuria.

## Benign Prostatic Hyperplasia (BPH)

- see [Urology](#), U8

### Definition

- hyperplasia of the stroma and epithelium in the periurethral transition zone

### History and Physical

- include current/past health, surgeries, trauma, current and OTC meds
- specific urinary symptoms (see Table 13)
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth and rubbery in BPH)

### Investigations

- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue, see [Urology](#), U25
  - values:
    - ♦ <4.0 ng/mL: normal, but must take into account patient's age and velocity of PSA increase
    - ♦ 4-10 ng/mL: consider measuring free/total PSA
    - ♦ >10 ng/mL: high likelihood of prostate pathology
  - PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
  - increased PSA in a younger man is more often due to cancer than other causes
  - abnormal DRE or PSA should trigger further assessment
  - discuss test with men at increased risk of prostate cancer (FHx, African ancestry) or who are concerned about development of prostate cancer
  - decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
- other tests:
  - Cr, BUN
  - post-void residual volume by ultrasound
  - urodynamic studies, renal ultrasound
  - patient voiding diary
- tests NOT recommended as part of routine initial evaluation include:
  - cystoscopy
  - cytology
  - prostate ultrasound or biopsy
  - IVP

**Table 13. Symptoms and Complications of BPH**

Obstructive Symptoms	Irritative Symptoms	Late Complications
Hesitancy (difficulty starting urine flow)	Urgency	Hydronephrosis
Diminution in size and force of urinary stream	Frequency	Loss of renal concentrating ability
Stream interruption (double voiding)	Nocturia	Systemic acidosis
Urinary retention (bladder does not feel completely empty)	Urge incontinence	Renal failure
Post-void dribbling	Dysuria	
Overflow incontinence		
Nocturia		

### Management

- referral to urologist if moderate/severe symptoms
- conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  - fluid restriction (avoid alcohol and caffeine)
  - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  - pelvic floor/Kegel exercises
  - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
  - $\alpha$ -receptor antagonists [e.g. terazosin (Hytrin<sup>®</sup>), doxazosin (Cardura<sup>®</sup>), tamsulosin (Flomax<sup>®</sup>), alfuzosin (Xatral<sup>®</sup>)]
    - ♦ relaxation of smooth muscle around the prostate and bladder neck
  - 5- $\alpha$  reductase inhibitor [e.g. finasteride (Proscar<sup>®</sup>)]
    - ♦ only for patients with demonstrated prostatic enlargement due to BPH
    - ♦ inhibits enzyme responsible for conversion of testosterone into dihydrotestosterone (DHT) thus reducing growth of prostate

#### Self-Management Asthma and COPD Education and Written Action Plan:

- Education is a key component in management of asthma and COPD.
- Guided self-management combining education, regular medical review, self-assessment and written action plan have been shown to reduce hospitalizations, ER visits, and missed days at work or school.
- Sample action plans available online: <http://www.respiratoryguidelines.ca>

#### Signs of Poorly Controlled Asthma

- $\beta_2$  agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk

#### Differential Diagnosis

- Prostate cancer
- Urethral obstruction
- Bladder neck obstruction
- Neurogenic bladder
- Cystitis
- Prostatitis

#### Prostate-Cancer Mortality at 11 Years of Follow-up

NEJM 2012;366:981-90

**Study:** Updated "ERSPC" study – multicentre randomized trial of screening for prostate cancer using PSA.

**Patients:** 162,388 men, age 55-69 from 8 different European countries.

**Intervention:** PSA-based screening.

**Main Outcome:** Mortality from prostate cancer.

**Results:** In screening group, RRR = 21%, ARR = 1.07 deaths/1000 men, NNT = 1055 – therefore to prevent one death from prostate cancer, 1055 men would need to be screened.

- phytotherapy (e.g. saw palmetto berry extract, *Pygeum africanum*)
  - ♦ more studies required before this can be recommended as standard therapy
  - ♦ considered safe
- surgical:
  - TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostates <30 g)
    - ♦ absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
    - ♦ complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

## Bronchitis (Acute)

### Definition

- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

### Epidemiology

- 5th most common diagnosis in family medicine, most common is URTI

### Etiology

- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, respiratory syncytial virus (RSV)
- 20% bacterial: *M. pneumoniae*, *C. pneumoniae*, *S. pneumoniae*

### Investigations

- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not very informative
- CXR if suspect pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or CHF
- pulmonary function tests with methacholine challenge if suspect asthma

### Management

- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (refer to *Antimicrobial Quick Reference*, FM53)
  - antibiotics in children show no benefit

#### Differential Diagnosis of Bronchitis

- URTI
- Asthma
- Acute exacerbation of chronic bronchitis
- Sinusitis
- Pneumonia
- Bronchiolitis
- Pertussis
- Environmental/occupational exposures
- Post-nasal drip
- Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body

#### How to Tell if Viral or Bacterial?

Bacterial infections tend to give a higher fever, excessive amounts of purulent sputum production, and may be associated with concomitant COPD. Note: purulent sputum is not necessarily bacterial.

#### Risk Factors for Coronary Artery Disease

##### Major

- Smoking
- Diabetes
- Hypertension
- Hyperlipidemia
- Family history of early CAD in first degree relative
- Untreated obstructive sleep apnea

##### Minor

- Obesity
- Sedentary lifestyle
- Age

## Chest Pain

- see [Cardiology and Cardiovascular Surgery](#), C4 and [Emergency Medicine](#), ER21

### Differential Diagnosis

**Table 14. Differential Diagnosis of Chest Pain**

Cardiac	Pulmonary	GI	MSK/Neuro	Psychologic
Angina*	Hemothorax*	Cholecystitis	Arthritis	Anxiety
Aortic dissection*	Lung CA	Esophageal spasm	Costochondritis	Depression
Endocarditis	PE*	GERD	Herpes zoster	Panic
MI*	Pneumonia	Hepatitis	Intercostal strain	
Myocarditis	Pneumothorax*	Perforated viscus*	Rib fractures	
Pericarditis*	Pulmonary HTN	PUD	Trauma	

\*Emergent

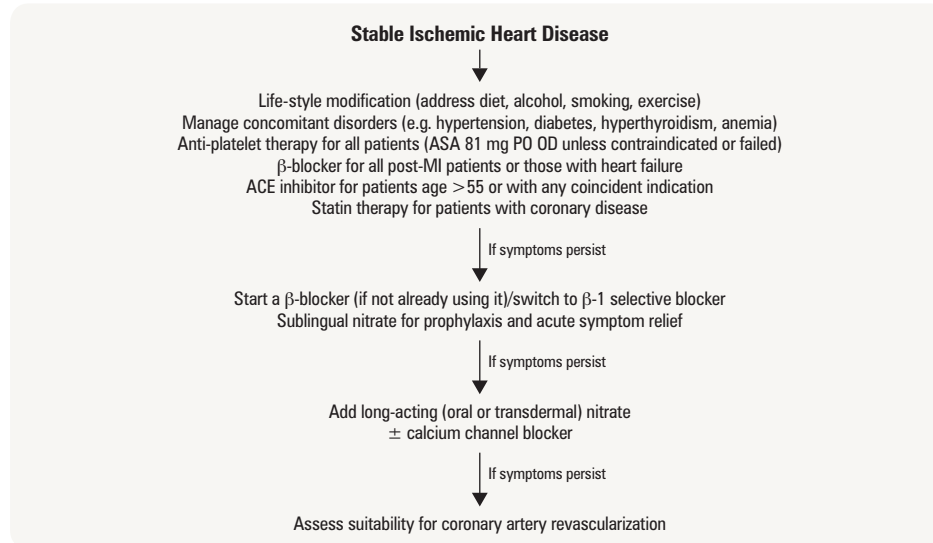

### Investigations

- ECG, CXR, and others if indicated (cardiac enzymes, D-dimers, liver function tests (LFTs), etc.)
- refer to ER if suspect serious etiology (e.g. aortic dissection, MI)

### Management of Common Causes of Chest Pain

- angina/ischemic heart disease
  - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ER
- myocardial infarction
  - ASA (162-325 mg, chewed), clopidogrel (Plavix\*), enoxaparin, morphine, oxygen, NTG

- $\pm$  reperfusion therapy with tissue plasminogen activator (tPA) or streptokinase (SK) if within 6 h (Note: can only use SK once in lifetime) or percutaneous intervention (cath lab)
- start  $\beta$ -blocker (e.g. metoprolol starting dose 12.5 mg PO OD and gradually increase dose, titrate to the HR rate goal of 60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids,  $H_2$  blockers, PPIs, patient education
- costochondritis: NSAIDs

**Figure 8. Treatment algorithm for stable ischemic heart disease**

References: Ontario Program for Optimal Therapeutics. Ontario drug therapy guidelines for stable ischemic heart disease in primary care. Toronto: Queen's Printer of Ontario, 2000. p10

Recommendations of the Task Force of the European Society of Cardiology. Guidelines on the management of stable angina pectoris, 2006. p63

#### High-Risk Symptoms and Signs of Chest Pain include:

- Severe pain
- Pain for >20 min
- New onset pain at rest
- Severe SOB
- Loss of consciousness
- Hypotension
- Tachycardia
- Bradycardia
- Cyanosis

#### MI in Elderly Women

Elderly women can often present with dizziness, back pain, lightheadedness or weakness, in the absence of chest pain.

#### Common Cold Etiology

**PRIMA**  
Paramyxoviruses  
Rhinoviruses  
Influenza viruses  
Myxoviruses  
Adenoviruses

#### Influenza vs. Colds: A Guide to Symptoms

Features	Flu	Cold
Onset of illness	Sudden	Slow
Fever	High fever	None
Exhaustion level	Severe	Mild
Cough	Dry severe or hacking	$\pm$
Throat	Fine	Sore
Nose	Dry and clear	Runny
Head	Achy	Headache-free
Appetite	Decreased	Normal
Muscles	Achy	Fine
Chills	Yes	No

#### Zinc for the Treatment of the Common Cold: A Systemic Review and Meta-Analysis of Randomized Controlled Trials

CMAJ 2012;184:E551-561

**Study:** Meta-analysis of 17 randomized control trials with a total of 2121 participants.

**Patients:** All populations.

**Intervention:** Orally administered zinc vs. placebo or no treatment.

**Results:** Patients receiving zinc had a shorter duration of cold symptoms compared with those given placebo (mean difference -1.65 d). Zinc shortened the duration of symptoms in adults but no significant difference was seen in children. Adverse event such as nausea were more common in the zinc group (RR 1.640).

## Common Cold (Acute Rhinitis)

### Definition

- viral URTI with inflammation

### Epidemiology

- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms
  - mainly rhinoviruses (30-35% of all colds)
  - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

### Risk Factors

- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

### Clinical Features

- symptoms
  - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
  - general: malaise, headache, myalgias, mild fever
- signs
  - boggy and erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
- complications
  - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
  - asthma/COPD exacerbation

### Differential Diagnosis

- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

## Management

- patient education
  - symptoms peak at 1-3 d and usually subside within 1 wk
  - cough may persist for days to weeks after other symptoms disappear
  - no antibiotics indicated because of viral etiology
  - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention
  - frequent hand washing, avoidance of hand to mucus membrane contact, use of surface disinfectant
- symptomatic relief
  - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
  - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye's syndrome)
  - cough suppression: dextromethorphan or codeine if necessary (children under 6 yr of age should not use any cough/cold medications)
  - decongestants, antihistamines
  - zinc lozenge use may help to reduced the duration of cold symptoms
- patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

### Echinacea for Preventing and Treating the Common Cold

*Cochrane DB Syst Rev* 2006;1:CD000530

This systematic review of 16 trials assessed the effect of Echinacea in preventing and treating common colds. Trials compared preparations containing Echinacea with placebo, no treatment, or an alternative common cold treatment. Variations in preparations and quality of Echinacea made meta-analysis difficult, but in general, results suggested some preparations of Echinacea may be better than placebo.

**Conclusions:** Echinacea preparations vary widely. Some preparations with *E. purpurea* may be effective but results are inconsistent.

## Contraception

- see [Gynecology](#), GY19

**Table 15. Methods of Contraception**

	Advantages	Disadvantages
<b>Combined OCP</b> (e.g. Alesse®, Tri-Cyclen®)	99.9% effective with perfect use, 97-99% with typical use, cycle control, ↓ dysmenorrhea, ↓ menstrual flow, ↓ ovarian cancer, ↓ endometrial cancer, ↓ risk of fibroids, ↓ acne, ↓ hirsutism	Irregular bleeding, systemic hormonal side effects (breast tenderness, nausea, mood changes), no STI protection, slightly increased risk of venous thromboembolism (VTE), MI, stroke, decreased quantity of breast milk postpartum
<b>Progestin Only Pill</b> (e.g. Micronor®)	At least 95% effective with perfect use, no increased risk of VTE, MI or stroke, suitable for postpartum	Hormonal side effects (see Combined OCP) Irregular bleeding, no STI protection, contraceptive reliability requires taking pill at the same time each day (within 3 h), no pill free interval
<b>Transdermal Patch</b> (e.g. Evra®)	Same as OCP, easy to use, changed weekly, 99% effective with correct use	Same as OCP, skin irritation
<b>NuvaRing®</b> (inserted by patient)	Same as OCP, easy to use (in for 3 wk, out for 1 wk), less systemic hormonal side effects, 99% effective with correct use	Same as OCP, vaginitis, some women may be uncomfortable with self-insertion
<b>DMPA</b> IM progesterone injection q12wk (e.g. DepoProvera®)	99.7% effective against pregnancy, infrequent dosing, ↓ menstrual flow or amenorrhea, ↓ risk of endometrial cancer	Irregular bleeding, delayed return of fertility, no STI protection, systemic hormonal side effects (most common is headache), weight gain, ↓ bone mineral density (check after 5 yr)
<b>Male Condom</b>	97% effective against pregnancy and STIs when used properly. When used properly WITH spermicide they are close to 99.9% effective, no Rx required	Latex allergy, irritation, only effective before the expiry date, must be applied properly, can only be used once
<b>Diaphragm</b>	92-96% effective with perfect use, non-hormonal, female-controlled method of contraception, ↓ risk of cervical cancer	Must be left in for 6 h after intercourse, must be used with spermicide, incomplete STI protection, latex allergy, must be fitted by health care worker, ↑ risk of UTI, risk of toxic shock syndrome
<b>Sponge</b>	One-size-fits-all barrier method, does not require fitting by MD, available in pharmacies, 90% effective without a condom, 98% effective with a condom	Relatively expensive, only ~60% effective in parous women, incomplete STI protection, risk of toxic shock syndrome
<b>Intrauterine Device (IUD)</b>	99% effective against pregnancy, effective for 5 yr, no daily regimen required, can be easily removed, ideal in post-partum women	No STI protection, ↑ relative risk of PID in first month, must be inserted by MD, risk of post-insertion vaso-vagal response, risk of uterine rupture is 0.6-1.6 per 1000, 2-10% expulsion rate
Levonorgestrel (e.g. Mirena®) Copper IUD (e.g. Nova T®)	Spotting, less systemic hormonal side effects than OCP  ↓ risk of endometrial cancer, less expensive than Mirena® (~\$170)	Hormonal side effects are possible, but less than OCP (see combined OCP), expensive (~\$400) Irregular bleeding or ↑ menstrual flow, 6-20% women discontinue use in first 5 yr because of pain or ↑ bleeding
<b>Fertility Awareness/Natural Family Planning</b> (e.g. symptothermal method)	Effectiveness: 95-98% with perfect use, 75-88% with typical use, increased awareness of gynecological health, reasonable for couples for whom an unplanned pregnancy would be acceptable	High probability of failure if not used consistently and correctly, no STI protection
<b>Lactational Amenorrhea</b>	Can be effective in breastfeeding women if menses not returned, fully or nearly fully breastfeeding baby and baby is under 6 mo old	Not effective if infant receives any food supplementary to breastfeeding Must breastfeed regularly, even through the night (at least q6h) Most effective is breastfeeding q2-3h

## EMERGENCY CONTRACEPTION (EC)

- hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital IUD insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- post-coital IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

### Absolute Contraindications to Estrogen Containing Contraception (Combined OCP/Transdermal Patch/Nuvaring)

- Known/suspected pregnancy
- Undiagnosed abnormal vaginal bleeding
- Thromboembolic disorders (e.g. previous DVT, PE)
- Cerebrovascular or coronary artery disease
- Estrogen dependent tumours (breast, uterus)
- Impaired liver function with acute liver disease
- Congenital hypertriglyceridemia
- Smoker age >35
- Migraines with focal neurological symptoms
- Uncontrolled hypertension

### Differential Diagnosis

#### Common Causes

- Upper airway cough syndrome (postnasal drip)
- Asthma/COPD
- GERD
- Non-asthmatic eosinophilic bronchitis

#### Other Causes

- ACE inhibitors
- Aspiration
- Bronchiectasis
- Cystic fibrosis
- Chronic interstitial lung disease
- CHF
- Lung/laryngeal cancer
- Pertussis
- Psychogenic
- Restrictive lung disease
- TB, atypical mycobacterium, and other chronic lung infections

### Dementia Quick Screen

- 3 simple tests, takes about 2 min
- Use when suspect mild cognitive impairment or when patient is at high risk
- Screen involves:
  1. 3 word recall (normal = recalls 2-3 words)
  2. Naming animals in 1 min (normal = >12 in one min)
  3. Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/hand placing, or only minor spacing problems)

**INTERPRETATION:** If all 3 results within normal range, cognitive impairment unlikely.

If any results abnormal, possible cognitive impairment, further evaluation necessary.

### Must Ask About/Rule Out

- Bipolar/manic/hypomanic episodes
- Psychosis
- Anxiety
- Bereavement
- Substance use/abuse/withdrawal
- Suicidal/homicidal ideation
- Organic cause

## Cough

### History and Physical

- duration (chronic >3 mo), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACE inhibitors), allergies
- PMH: lung (asthma, COPD, CF), heart (CHF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O<sub>2</sub> saturation, respiratory exam, HEENT and precordial exam

### Investigations

- guided by findings on history and physical
  - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

## Dementia

- see [Psychiatry](#), PS20

### Epidemiology

- 10% in patients over the age of 65, 25% in patients over the age of 85, 50% in patients over the age of 90
- prevalence increases with age, Down syndrome and head trauma
- differential diagnosis: Alzheimer's dementia, vascular dementia, Lewy-Body dementia, frontotemporal dementia

### Investigations

- history, physical, MMSE, MOCA (best screening test), dementia quick screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B<sub>12</sub>, folate, VDRL, HIV, single photon emission computed tomography, head CT, EEG

### Management

- treat and prevent reversible causes
- provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
- family education, counselling and support (respite programs, group homes)
- pharmacologic therapy: NMDA receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose neuroleptics and antidepressants can be used to treat behavioral and emotional symptoms
- 20% of patients develop clinical depression, most commonly seen in vascular dementia

## Depression

- see [Psychiatry](#), PS9

### Etiology

- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of depressed persons may not receive appropriate treatment for their depression
- identification and early treatment improve outcomes

## Screening Questions

- Are you depressed? (high specificity and sensitivity)
- Have you lost interest or pleasure in the things you usually like to do? (anhedonia)
- Do you have problems sleeping?
- For geriatric population, use the Geriatric Depression Scale (GDS) short form for screening

## Assessment

- risk factors: see [Psychiatry](#), PS11
- personal or family history of depression
- medications and potential substance abuse problems
- high risk suicidality/homicidality
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including anhedonia or depressed mood  $\geq 2$  wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck's depression inventory, Zung's self-rating depression scale, Children's depression inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical examination, CBC, TSH, electrolytes, urinalysis, glucose, etc.)

## Treatment

- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment can consist of pharmacotherapy alone or psychotherapy alone
- combination of antidepressant drug therapy and psychotherapy results in synergistic effects

**Table 16. Common Medications**

Class	Examples	Action	Side Effects	Notes
<b>SSRI</b>	paroxetine (Paxil®) fluoxetine (Prozac®) sertraline (Zoloft®) citalopram (Celexa®) fluvoxamine (Luvox®) escitalopram (Cipralex®)	Block serotonin reuptake	Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested)	First line therapy for teens is fluoxetine; paroxetine is not recommended for teens (controversial)
<b>SNRI</b>	venlafaxine (Effexor®) duloxetine (Cymbalta®)	Block serotonin and NE reuptake	Insomnia, tremors, tachycardia, sweating	
<b>SDRI</b>	bupropion (Wellbutrin®)	Block dopamine and NE reuptake	Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs	Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication
<b>TCA</b>	amitriptyline (Elavil®)	Block serotonin and NE reuptake	Sexual dysfunction, weight gain, tremors, tachycardia, sweating	Narrow therapeutic window, lethal in overdose

## Prognosis

- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

# Diabetes Mellitus (DM)

- see [Endocrinology](#), E6

## Epidemiology

- major health concern, affecting up to 10% of Canadians
- type 1 diabetes mellitus (DM1): 10-15% of DM, peak incidence age 10-15
- type 2 diabetes mellitus (DM2): 85-90% of DM, peak incidence age 50-55, up to 60,000 new cases in Canada per year
- gestational diabetes mellitus (GDM): 2-4% of all pregnancies
- incidence of type DM2 is rising dramatically as a result of an aging population, rising rates of obesity, and sedentary lifestyles
- leading cause of new-onset blindness and renal dysfunction
- Canadian adults with diabetes are twice as likely to die prematurely, compared to persons without diabetes

## Differential Diagnosis

- Other psychiatric disorders (e.g. anxiety, personality, bipolar, schizoaffective, seasonal affective disorder, substance abuse/withdrawal)
- Early dementia
- Endocrine (e.g. hyper/hypothyroidism, DM)
- Liver failure, renal failure
- Chronic fatigue syndrome
- Vitamin deficiency (pernicious anemia, pellagra)
- Medication side effects ( $\beta$ -blockers, benzodiazepines)
- Infections (mononucleosis)
- Menopause
- Cancer (50% of patients with tumours, especially of brain, lung and pancreas, develop symptoms of depression before the diagnosis of cancer is made)

## Criteria for Depression

### M-SIGECAPS

- M** Depressed Mood
- S** Increased/decreased Sleep
- I** Decreased Interest
- G** Guilt
- E** Decreased Energy
- C** Decreased Concentration
- A** Increased/decreased Appetite and weight
- P** Psychomotor agitation/retardation
- S** Suicidal ideation

## Common Antidepressants and Dosing

Drug	Starting Dose	Maximum Dose
citalopram (Celexa®)	10-20 mg PO OD	40 mg PO OD
escitalopram (Cipralex®)	5-10 mg PO OD	20 mg PO OD
fluoxetine (Prozac®)	20 mg PO qam	80 mg PO OD
paroxetine (Paxil®)	20 mg PO qam	50 mg PO OD
sertraline (Zoloft®)	25-50 mg PO OD	200 mg PO OD
fluvoxamine (Luvox®)	50 mg PO qhs	300 mg PO OD
venlafaxine (Effexor®)	37.5 mg PO OD	375 mg PO OD
(Effexor XR®)	37.5 mg PO OD	225 mg PO OD
bupropion (Wellbutrin®-immed)	100 mg PO bid	450 mg PO OD
(Sustained release)	100 mg PO qam	400 mg PO OD
amitriptyline (Elavil®)	25 mg PO qhs	300 mg PO OD
mirtazapine (Remeron®)	15 mg PO qhs	45 mg PO OD

## Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review

*Arch Gen Psychiatry* 2004;61:714-719  
**Study:** Systematic review of randomized clinical trials.

**Patients:** 16 trials comprising 1842 patients.

**Intervention:** Antidepressant treatment alone vs. combination of psychological intervention and antidepressant therapy.

**Main outcomes:** Efficacy of and adherence to therapy.

**Results:** Overall, combined therapy was significantly more effective than antidepressant therapy alone (OR 1.86; 95% CI 1.38-2.52), however there was no difference in the rate of dropouts and non-responders in either treatment arm. In studies lasting  $> 12$  wk, combined therapy showed a reduction in dropouts compared to non-responders (OR 0.59; 95% CI 0.39-0.88).

## Risk Factors

- DM1
  - personal or family history of autoimmune disease
- DM2
  - first degree relative with DM
  - age  $\geq 40$  yr
  - obesity (especially abdominal), hypertension, hyperlipidemia, coronary artery disease, vascular disease
  - prior GDM, macrosomic baby ( $>4$  kg)
  - PCOS
  - history of impaired glucose tolerance or impaired fasting glucose
  - presence of complications associated with diabetes
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
- both
  - member of a high risk population (e.g. Aboriginal, Hispanic, Asian or African descent)

## Diagnosis

- persistent hyperglycemia is the hallmark of all forms of diabetes

**Table 17. Diagnosis of Insulin Associated Disorders**

Condition	Diagnostic Criteria
DM	One of the following on 2 occasions: <ul style="list-style-type: none"> <li>• Random BG <math>\geq 11.1</math> mmol/L (200 mg/dL) with symptoms of DM (fatigue, polyuria, polydipsia, unexplained weight loss) OR</li> <li>• Fasting BG <math>\geq 7.0</math> mmol/L (126 mg/dL) OR BG 2 h post 75 g OGTT <math>\geq 11.1</math> mmol/L (200 mg/dL) OR HbA1c <math>\geq 6.5\%</math> (in adults)</li> </ul>
Impaired Fasting Glucose (IFG)	Fasting BG = 6.1-6.9 mmol/L (110-124 mg/dL)
Impaired Glucose Tolerance (IGT)	BG 2 h post 75 g OGTT = 7.8-11.0 mmol/L (141-198 mg/dL)

## Screening

- DM2
  - FBG in everyone  $\geq 40$  q3yr, or at high risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of  $\geq 1$  risk factor (see above)
- GDM (see [Obstetrics](#), OB14)
  - all pregnant women between 24-28 wk gestation
  - non-fasting 1 h 50 g OGCT  $\geq 10.3$  mmol/L (186 mg/dL) is diagnostic
  - if between 7.8-10.2 mmol/L (141-184 mg/dL), do confirmatory fasting 2 h 75 g OGTT
  - if develop GDM, have a 50% chance of developing DM2 over 20 yr

## Goals of Therapy

**Table 18. Goals of Therapy in DM**

General	Avoid complications (e.g. ketoacidosis, hyperglycemia, infection) Prevent long-term complications (microvascular and macrovascular) Minimize negative sequelae associated with therapies (e.g. hypoglycemia, weight gain)
Fasting or Preprandial BG	Ideal: 4-7 mmol/L (72-126 mg/dL) Suboptimal: 7.1-10 mmol/L (128-180 mg/dL); action may be required Inadequate: $> 10.0$ mmol/L (180 mg/dL); action required
HbA1c	$\leq 7\%$ or $\leq 6.5\%$ in some DM2 patients at risk for nephropathy Suboptimal: 7-8.4% Inadequate: $> 8.4\%$
2 h Postprandial BG	5-10 mmol/L (90-180 mg/dL) if HbA1c target met 5-8 mmol/L (90-144 mg/dL) if HbA1c target not met
Blood Pressure	$< 130/80$ in adults (DM and HTN guidelines)
Lipids	LDL $< 2.0$ mmol/L (36 mg/dL) Triglycerides $< 1.5$ mmol/L (27 mg/dL) Total cholesterol/HDL ratio $< 4.0$ mmol/L (72 mg/dL)

### DM Related Symptoms

**Hyperglycemia:** polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections.

**Diabetic ketoacidosis (DKA):** fruity breath, anorexia, N/V, fatigue, abdo pain, Kussmaul breathing, dehydration.

**Hypoglycemia:** hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma.

DKA can be triggered by infection, ischemia, infarction, intoxication, medication non-compliance.

### Long Term Complications of DM

- Microvascular: nephropathy, retinopathy, neuropathy
- Macrovascular: CAD, CVD, PVD

### Screening for Microvascular Complications:

- **Nephropathy:**
  - Urine ACR, serum Cr – Type 2: at diagnosis, then annually;
  - Type 1: 5 yr after diagnosis, then annually)
- **Retinopathy:**
  - Ophthalmology consult – Type 2: at diagnosis then ophtho follow-up q1-2yr; Type 1: 5 yr after diagnosis, then annual follow-up

## Assessment and Monitoring

**Table 19. Assessment and Monitoring**

	Initial Assessment	q2-4months	Annually
<b>History</b>	<ul style="list-style-type: none"> <li>Symptoms of hyperglycemia, ketoacidosis, hypoglycemia</li> <li>Past medical history</li> <li>Functional inquiry</li> <li>Family history</li> <li>Risk factors</li> <li>Medications</li> <li>Sexual function</li> <li>Lifestyle</li> </ul>	<ul style="list-style-type: none"> <li>Diabetes-directed history</li> <li>Screen for awareness and frequency of hypoglycemia and DKA</li> <li>Glucose monitoring</li> <li>Use of insulin and oral agents</li> </ul>	<ul style="list-style-type: none"> <li>Diabetes-directed history</li> <li>Screen for awareness and frequency of hypoglycemia and DKA</li> <li>Glucose monitoring</li> <li>Use of insulin and oral agents</li> <li>Sexual function</li> <li>Lifestyle counselling</li> <li>Psychosocial issues</li> </ul>
<b>Physical</b>	<ul style="list-style-type: none"> <li>General: Ht, Wt, BMI, BP, WC</li> <li>Head and neck: funduscopy, thyroid exam</li> <li>Cardiovascular exam: signs of PVD, pulses, bruits</li> <li>Abdominal exam (e.g. for organomegaly)</li> <li>Hand/foot/skin exam</li> <li>Neurological exam</li> </ul>	<ul style="list-style-type: none"> <li>Wt, BP, BMI, WC</li> <li>Foot exam for sensation (using a 10 g monofilament), ulcers, or infection</li> </ul>	<ul style="list-style-type: none"> <li>Complete neuro exam for peripheral neuropathy</li> <li>Remainder of exam as per PHE</li> </ul>
<b>Investigations</b>	<ul style="list-style-type: none"> <li>FBG, HbA1c, fasting lipids, microalbumin:creatinine ratio</li> <li>ECG</li> </ul>	<ul style="list-style-type: none"> <li>HbA1c q3mo</li> <li>FBG as needed</li> </ul>	<ul style="list-style-type: none"> <li>Fasting lipid profile</li> <li>Resting or exercise ECG if age &gt;35</li> <li>Dipstick analysis for gross proteinuria; if negative: annual microalbuminuria screening with random albumin:creatinine ratio for DM2 and DM1 (5 yr post puberty) If positive: 24-h urine for endogenous creatinine clearance rate and microalbuminuria q6-12mo</li> </ul>
<b>Management</b>	<ul style="list-style-type: none"> <li>Nutritional and physical education</li> <li>Consider referral to diabetes education program if available</li> <li>Monitoring BG: explain methods and frequency</li> <li>Medication counselling: oral hypoglycemics and/or insulin, method of administration, dosage adjustments</li> <li>Pneumococcal vaccination</li> <li>Ophthalmology consult               <ul style="list-style-type: none"> <li>DM1 within 5 yr</li> <li>DM2 at diagnosis</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Assess progress towards long-term complications</li> <li>Adjust treatment plan if necessary</li> </ul>	<ul style="list-style-type: none"> <li>Calibrate home glucose monitor</li> <li>Arrange ophthalmology follow-up annually for DM1 and q2yr for DM2</li> <li>Influenza vaccination annually</li> </ul>

## Nonpharmacologic Management

- diet
  - all diabetics should see a registered dietician
  - can reduce HbA1c by 1-2%
  - strive to attain healthy body weight
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, encourage complex carbohydrates, choose low glycemic-index foods
- physical activity and exercise
  - at least 150 min of aerobic exercise per wk, plus 2 sessions per wk of resistance exercise is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP and improves lipid profile
  - if insulin treated, may require alterations of diet, insulin regimen, injection sites and self-monitoring

## Self-Monitoring of Blood Glucose

- DM1: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- DM2: at least once per day, if once daily insulin regime
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

### Long-Term Non-Pharmacological Weight Loss Interventions for Adults with Prediabetes

*Cochrane DB Syst Rev 2005;2:CD005270*

A meta-analysis, using 9 studies comprising 5168 patients, investigated the effectiveness of diet control, physical activity, behavioural weight programs and weight control interventions in adults with pre-diabetes. The analysis was limited by heterogeneous patient populations, but when compared with usual care, weight loss was 2.8 kg and BMI decrease was 1.3 kg/m<sup>2</sup> at 1 yr. Modest but non-significant improvements in glycemic control, BP and blood lipid concentrations were noted. Studies with a follow-up of 3-6 yr showed a significant decrease in diabetes onset when compared with controls.

### Dietary Advice for Treatment of Type 2 DM in Adults

*Cochrane DB Syst Rev 2007;3:CD004097*

A meta-analysis, using 36 articles reporting a total of 18 trials following 1467 participants, showed that there is no high quality data on the efficacy of dietary treatment of type 2 DM. After 6 and 12 mo, adoption of exercise improved HbA1c.

Figure 9. Types of insulin preparation

**Calculate Total Insulin Required:**

DM1: 0.5-0.7 units/kg/d

DM2: 0.3 units/kg/d

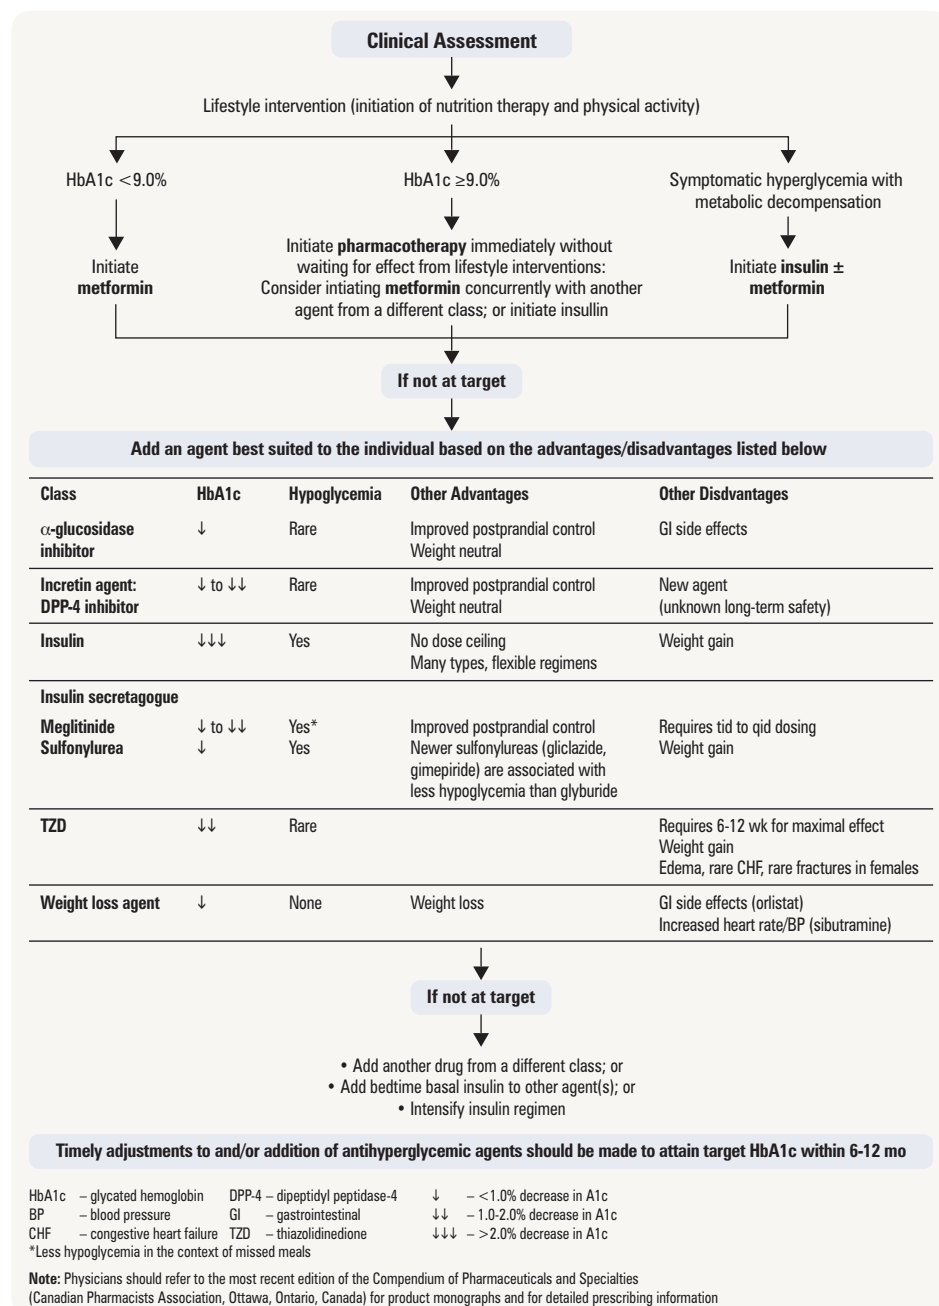

Figure 10. Management of hyperglycemia in type 2 diabetes

Canadian Diabetes Association Clinical Practice Guidelines Expert Committee. Pharmacologic Management of Type 2 Diabetes. Can J Diabetes. 2013;37:S61-S68 (used with permission)

## Hypoglycemic Agents (DM2)

- oral
  - biguanide: metformin (Glucophage®)
  - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  - $\alpha$ -glucosidase inhibitor: acarbose (Precose®)
  - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
  - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicon®)
  - DPP-4 inhibitor: sitagliptin (Januvia®)
- injectable
  - GLP-1 analogue: liraglutide (Victoza®)

## Other Medications Used in DM

- ACE inhibitors for:
  - all hypertensive diabetics
  - elevated microalbuminuria (30-300 mg albumin in urine in 24 h)
  - overt nephropathy (>300 mg albumin in urine in 24 h)
  - ARBs are second line for these conditions
- ASA 81 mg once a day for:
  - all diabetics, unless contraindicated
- statins
  - as required to attain target lipid profile

### Canadian Diabetes Association 2008 Clinical Practice Guidelines for Rosiglitazone Use in Type 2 Diabetes:

- 2nd line therapy, 6-12 wk required to achieve full glycemic effect
- Longer duration of glycemic control with monotherapy compared to metformin or glyburide
- Contraindicated in patients with heart failure or LV dysfunction on echo
- Cannot be combined with insulin therapy (increased rates of heart failure)
- Side effects: weight gain (waist to hip ratio not increased), may induce edema and/or congestive heart failure, fractures, rare: macular edema

### Metformin Monotherapy for Type 2 Diabetes Mellitus

*Cochrane DB Syst Rev* 2005;3:CD002966

A Cochrane Review of 29 trials with 37 arms (5259 participants) compared metformin with sulfonylureas, placebo, diet, thiazolidinediones, insulin, meglitinides, and glucosidase inhibitors. The authors concluded that metformin may prevent some vascular complications and mortality in overweight and obese DM2 patients and as such may be considered first line therapy. There is no evidence that the studied alternative therapies have more benefit for glycemia control, body weight, or lipids than does metformin.

### Rosiglitazone Revisited: An Updated Meta-Analysis of Risk for Myocardial Infarction and Cardiovascular Mortality

*Arch Intern Med* 2010;170:1191-1201

Eleven years after the introduction of rosiglitazone, the totality of randomized clinical trials continue to demonstrate increased risk for MI although not for CV or all-cause mortality. The current findings suggest an unfavorable benefit to risk ratio for rosiglitazone.

## Diarrhea

- see [Gastroenterology](#), G15

### Definition

- passage of 3 or more loose or liquid stools in a day or more frequently than is normal for the individual (WHO definition)
- can be acute (<14 d duration) or chronic (>14 d duration)

### Etiology and Clinical Features

- acute diarrhea:
  - majority of cases are self-limiting
  - most commonly caused by viral infection (e.g. rotavirus, norovirus)
  - fever and bloody stools increase probability of bacterial infection
  - consider *C. difficile* infection if recent hospitalization, recent antibiotic use (e.g. broad spectrum antibiotics, fluoroquinolones, clindamycin), chronic use of PPIs, age >65, immunosuppression
- chronic diarrhea:
  - most commonly of non-infectious etiology
  - common causes include drugs (e.g. laxatives, antibiotics), infection (e.g. bacteria, parasites), inflammation (e.g. IBD, diverticulitis), neoplasia (e.g. colon cancer), malabsorption (e.g. celiac disease), maldigestion (e.g. lactose intolerance), and idiopathic

### Treatment

- acute diarrhea: ensure adequate hydration, treat underlying cause (e.g. antibiotics for bacterial infection)
- chronic diarrhea: nonspecific treatment often required before workup is complete
  - oral rehydration solution (if needed): offset electrolyte imbalances
  - lifestyle modification (dietary changes, exercise)
  - fibre (e.g. psyllium): commonly used as adjunctive treatment
  - antidiarrheal opiates (e.g. loperamide): most effective nonspecific treatment
    - ♦ should be used on a scheduled basis before meals rather than prn

## Dizziness

- see [Otolaryngology](#), OT5

### Epidemiology

- 70% see general practitioners initially; 4% referred to specialists
- frequency proportional to age; commonest complaint of ambulatory patients age >75

## Differential Diagnosis

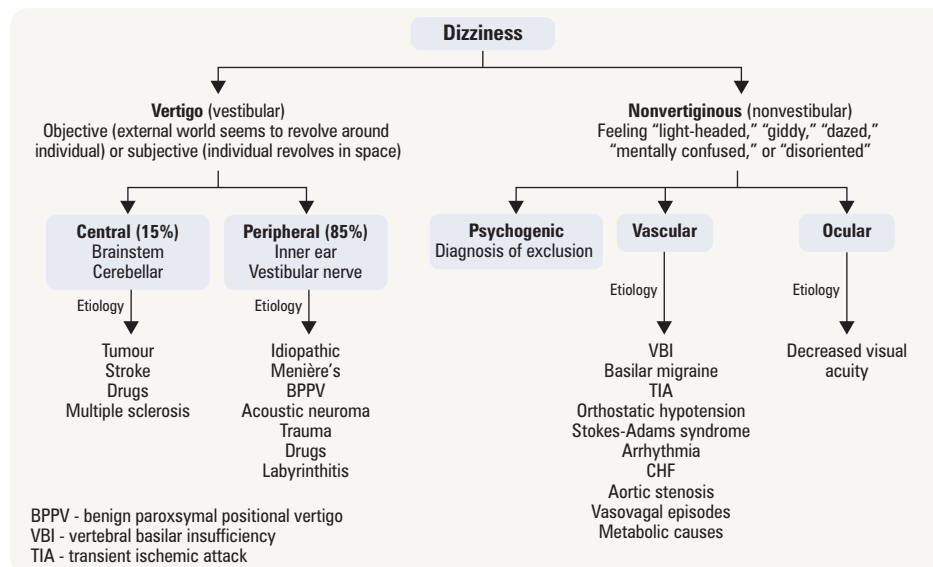

Figure 11. Differential diagnosis of dizziness

### History

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- onset, precipitating/alleviating factors, preceding infections and activities, associated symptoms, previous experiences of dizziness
- duration (seconds, minutes, hours, days, weeks, or persistent)
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (nonvestibular)
  - worse with exercise (cardiac/pulmonary causes)
- associated symptoms
  - neurologic (central)
    - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
    - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
  - audiologic (peripheral)
    - hearing loss, tinnitus, otalgia, aural fullness
  - others
    - nausea, vomiting (peripheral vestibular disorders)
    - SOB, palpitations (hyperventilation, cardiac problem)
- general medical history
  - HTN, diabetes, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol

### Physical Exam/Investigations

- syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - bloodwork, ECG, 24-h Holter, treadmill stress test, loop ECG, tilt table testing, carotid and vertebral doppler, EEG
- vertiginous
  - ENT and neurologic exams
  - Dix-Hallpike (see sidebar), consider audiometry and MRI if indicated
- non-syncopal, non-vertiginous
  - cardiac and neurologic exams
  - 3-min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG

### Treatment

- guided by history, physical and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

#### DDx of Vertigo

	BPPV	Labyrinthitis	Menière's	Acoustic Neuroma
Onset	sudden	sudden	gradual	insidious
Duration	seconds	days	min-hours	chronic
Hearing Loss	—	+	+	+
Tinnitus	—	+	+	+
Neuro Sx	—	—	—	+

#### Dix-Hallpike Test

- Have the patient seated with legs extended and head at 45° rotation
- Rapidly shift patient to supine position with head fully supported in slight extension (for 45 s)
- Observe for rotatory nystagmus and ask about sensation of vertigo

## Domestic Violence/Elder Abuse

### INTIMATE PARTNER VIOLENCE

#### Definition

- includes physical, sexual, emotional, psychological and financial abuse (see [Emergency Medicine](#), ER29)

#### Epidemiology

- lifetime prevalence of intimate partner violence against women is between 25-30%
- women who experience abuse have increased rates of injury, death and health consequences including 50-70% increase in gynecological, central nervous system, stress-related problems
- occurs in all socioeconomic, educational and cultural groups with increased incidence in pregnancy, disabled women, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs
- physician recognition rates as low as 5%

#### Presentation

- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

#### Management

- screen ALL patients
  - always have a high index of suspicion
  - physician is often first person to get disclosure
  - health care visits are an important opportunity for physicians to address intimate partner violence
  - asking about abuse is the strongest predictor of disclosure
  - several screening tools (see sidebar) exist to identify victims of partner violence
  - make sure to determine the victim's level of immediate and long term danger and ask if there are weapons in the house
- ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation
- provide community resources
  - safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go and having money, clothes, keys, medications, important documents and other emergency items prepared should the patient need to leave quickly
  - shelter or helpline number with legal advocacy and counselling services
  - involve social workers or domestic violence advocates
  - marital counselling inappropriate until safety is established and violence under control
- appointment for follow-up to assess whether condition is better or worse
- reassure patient she/he is not to blame and that the assault is a crime
  - goal is to convey the message that "As your doctor, I am concerned for your safety" and "Your partner has a problem that he/she needs help with" and "I want to help you"
  - reporting suspected or known child abuse is mandatory (see [Emergency Medicine](#), ER59)
  - spousal abuse is a criminal act, but not reportable without the woman's/man's permission
- DOCUMENT all evidence of abuse-related visits for medico-legal purposes (see sidebar)

### ELDER ABUSE

#### Definition

- mistreatment of elderly by those in a position of trust, power, or responsibility for their care
- types of abuse:
  - psychological (e.g. threatening, intimidating, insulting, demeaning, withholding information that may be important to them, ignoring)
  - financial (e.g. stealing, pressuring to sell or share home, misusing power of attorney)
  - physical (e.g. hitting, burning, locking in room, inappropriate use of physical restraints, withholding or misusing medication)
  - sexual
  - neglect

#### Epidemiology

- 7% of adults in Canada age >65 reported experiences of emotional or financial abuse
- older adults who live with someone are more likely to be abused than those who live alone
- 31% of reported violent abuse cases involved family members (Statistics Canada, 2009):
  - most often at the hands of adult children (32%) followed by spouses (28%)
  - older females are more likely to be abused than older males
  - men are more likely than women to be victimized by an adult child (34% vs. 31%)
  - women are more likely than men to experience violence at the hands of a spouse (32% vs. 22%)
- reasons for under-reporting: fear, shame, cognitive impairment, language/cultural barriers, and social and geographic isolation

#### Screening Instruments for Domestic Violence

##### A) Woman Abuse Screening Tool (WAST)-SHORT

- In general how would you describe your relationship?
  - A lot of tension
  - Some tension
  - No tension
- Do you and your partner work out arguments with . . . ?
  - Great difficulty
  - Some difficulty
  - No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely

##### B) HITS

- How often does your partner:
- Physically hurt you?
  - Insult you?
  - Threaten you with harm?
  - Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)  
A total score of 10.5 is significant

#### How to Document Abuse

- Take photographs (with permission) of known or suspected injuries
- Use an injury location chart or "body map" when documenting physical findings
- Document any investigations ordered (e.g. x-ray)
- Write legibly or use a computer
- Record the patient's own words in quotation marks
- Avoid phrases that imply doubt about the patient's reliability (e.g. "patient claims that...")
- Record the patient's demeanor (e.g. upset, agitated)
- Record the time of day the patient is examined and how much time has elapsed since the abuse occurred

#### Risk Factors

- Female
- Older age (age 80 and older)
- Physical and mental frailty

**Screening**

- insufficient evidence to include or exclude as part of the periodic health examination, but recommended that physicians be alert for indicators of abuse and institute measures to prevent further abuse
- general questions such as “Do you feel safe at home?” and move into more specific questions about different kinds of abuse

**Presentation**

- signs that an older adult is being abused may include:
  - depression, fear, anxiety, passivity, unexplained injuries, dehydration, malnutrition, poor hygiene, rashes, pressure sores, and over-sedation/inappropriate medication use

**Management**

- gather information from all sources (e.g. family members, health care providers, neighbours)
- perform a thorough physical examination
- ensure immediate safety and devise a plan for follow-up
- additional steps depend on whether the patient accepts intervention and whether they are capable of making decisions about their care
- interventions may include use of protective and legal services, senior resource nurses, elder abuse intervention teams and senior support groups

## Dyspepsia

- see [Gastroenterology](#), G10

**Definition and Clinical Features**

- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, nausea or vomiting

**Epidemiology**

- annual incidence 1-2%, prevalence 20-40%

**Etiology**

- common: functional, peptic ulcer disease, gastroesophageal reflux disease (GERD), gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

**History**

- symptoms may not be useful in finding cause
- association with food, anorexia, nausea, vomiting, NSAID use

**Investigations and Management**

- lifestyle modifications: dietary changes, decreased EtOH consumption, smoking cessation
- empiric therapy: H<sub>2</sub> receptor blockers, proton pump inhibitors (PPIs) for short periods of time (8 wk with taper)
- testing for *H. pylori*: serology, urea breath test
- upper endoscopy (preferred), upper GI series

**Dyspepsia Red Flags**

- Weight loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset age >50

**DDx of Dyspnea****Pulmonary**

- COPD
- Asthma
- Restrictive lung disease
- Pneumothorax
- Congenital lung disease

**Cardiac**

- CHF
- CAD
- MI (recent or past)
- Cardiomyopathy
- Valve dysfunction
- Pericarditis
- Arrhythmia
- Hypertrophy

**Mixed/Other**

- Deconditioning
- Trauma
- Pain
- Neuromuscular
- Metabolic condition
- Functional: anxiety, panic attack, hyperventilation

## Dyspnea

- see [Respirology](#), R3 and [Emergency Medicine](#), ER27

**History and Physical**

- history
  - cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema
  - asthma, allergy, eczema, ASA/NSAID sensitivity, nasal polyps
  - constitutional symptoms
  - smoking, recreational drugs, medications
  - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  - travel and birth place
  - FHx of atopy
  - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

**Investigations**

- CXR, ECG
- PFTs, ABG acutely if indicated

**Management**

- ABCs: send to ER if in severe respiratory distress
- depends on cause

## Dysuria

- see [Urology](#), U5

### Definition

- the sensation of pain, burning or discomfort on urination

### Epidemiology

- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per year
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

### Etiology

- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, chemicals, foreign bodies, trauma, neoplasm, kidney stones

**Table 20. Etiology, Signs and Symptoms of Dysuria**

Infection	Etiology	Signs and Symptoms
UTI/Cystitis	KEEPS bacteria ( <i>Klebsiella</i> , <i>E. coli</i> , <i>Enterobacter</i> , <i>Proteus mirabilis</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> )	Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare)
Urethritis	<i>C. trachomatis</i> , <i>N. gonorrhoeae</i> , <i>Trichomonas</i> , <i>Candida</i> , herpes	Initial dysuria, urethral/vaginal discharge, history of STI
Vaginitis	<i>Candida</i> , <i>Gardnerella</i> , <i>Trichomonas</i> , <i>C. trachomatis</i> , atrophic, herpes, lichen sclerosis	External dysuria/pain, vaginal discharge, irritation, dyspareunia, abnormal vaginal bleeding
Prostatitis	<i>E. coli</i> , <i>C. trachomatis</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Dysuria, fever, chills, urgency, frequency, tender prostate, rectal pain
Pyelonephritis	<i>E. coli</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, nausea or vomiting

### Investigations

- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for *N. gonorrhoeae* and *C. trachomatis*
- radiologic studies and other diagnostic tests if atypical presentation
- see [Pediatrics](#), P65 for UTI in children

### Management

- see [Antimicrobial Quick Reference](#), FM55 for treatment
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic, due to risk of preterm labour; need to follow with monthly urine cultures and retreat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
- urethritis
  - when swab or PCR is positive for chlamydia or gonorrhea must report to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation

#### UTI Clinical Decision Aid

- Dysuria
- + Leukocytes
- + Nitrites

if 2 or more criteria MET, then treat without culture, otherwise culture required prior to treatment.

*Arch Intern Med* 2007;67:2201-2206

#### Risk Factors for Complicated UTI

- Male sex
- Pregnancy
- Recent urinary tract instrumentation
- Functional or anatomic abnormality of the urinary tract
- Chronic renal disease
- Diabetes
- Immunosuppression
- Indwelling catheter

#### Prevention of UTIs

- Maintain good hydration (especially with cranberry juice) (recommendation level I)
- Wipe urethra from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

#### Cranberries for Preventing Urinary Tract Infections

*Cochrane DB Syst Rev* 2008;1:CD001321

**Study:** Meta-analysis of 10 RCTs, n=1049.

**Patients:** All populations.

**Intervention:** Cranberry juice vs. placebo, juice or water was evaluated in seven studies, and cranberry tablets vs. placebo in four studies.

**Main Outcome:** UTIs – symptomatic and asymptomatic.

**Results:** Cranberry products significantly reduced the incidence of UTIs at 12 mo (RR 0.65, 95% CI 0.46 to 0.90) compared with placebo/control.

**Conclusion:** There is some evidence that cranberry products may decrease the number of symptomatic UTIs over a 12 mo period, particularly for women with recurrent UTIs.

## Epistaxis

- see [Otolaryngology](#), OT26

**Table 21. Characteristics of Anterior vs. Posterior Bleeds**

	Anterior (90%)	Posterior (10%)
<b>Location/ Origin</b>	Little's area/Kiesselbach's plexus	Woodruff's plexus/sphenopalatine artery
<b>Age (yr)</b>	2-10, 50-80	Usually >50
<b>Common Cause</b>	Trauma (digital, fracture, foreign body), dry air, cool climate, post URTI, nasal dryness, chemical (nasal sprays, cocaine), tumour	Systemic: hepatic disease, primary/secondary bleeding disorder, medications (ASA, NSAIDs, warfarin), HTN, atherosclerosis
<b>Investigations</b>	Bloodwork (CBC, INR/PTT, cross and type, LFTs) Imaging (x-ray, CT as needed, nasopharyngoscopy)	Same as for anterior bleeds
<b>Treatment</b>	Conservative: <ul style="list-style-type: none"> <li>• Position: upright leaning forward with direct digital pressure over soft part of nostril for &gt;10 min ("pinch" up to cartilage)</li> <li>• Humidifier in bedroom, nasal saline sprays, bacitracin or Vaseline® application to Little's area</li> <li>• Silver nitrate</li> <li>• Gelfoam/hemostat</li> <li>• Nasal packing with Vaseline® gauze, nasal catheter or sponge</li> <li>• Cotton soaked in vasoconstrictor (oxymetazoline 0.5%) and topical anesthetic (4% lidocaine) placed in anterior nasal cavity with direct pressure for &gt;10 min</li> </ul>	Emergency: ENT/ER consult for posterior packing with an intranasal balloon/foley catheter embolization/surgery
<b>Prognosis</b>	Usually stops with >10 min of pressure to nose	Copious bleed, often swallowed and vomited May lead to hypovolemic shock if not treated promptly

## Erectile Dysfunction (ED)

- see [Urology](#), U30

### Definition

- consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of  $\geq 3$  mo duration

### Epidemiology

- ~20% of men aged 40; ~50% of men aged 70

### Etiology

- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, diabetes), anatomic (structural abnormality, e.g. Peyronie's), neurologic (post-op, diabetes), medications (clonidine, antihypertensives, psychotropics)
- psychogenic (10%)

**Table 22. Differentiation Between Organic and Psychogenic ED**

Characteristic	Organic	Psychogenic
<b>Onset</b>	Gradual	Acute
<b>Circumstances</b>	Global	Situational
<b>Course</b>	Constant	Varying
<b>Non-coital erection</b>	Poor	Rigid
<b>Morning erection</b>	Absent	Present
<b>Psychosexual problem</b>	Secondary	Long history
<b>Partner problem</b>	Secondary	At onset
<b>Anxiety and fear</b>	Secondary	Primary

Walsh: Campbell's Urology, 8th ed. Table 46-4

### History

- comprehensive sexual, medical and psychosocial history
- time course
  - last satisfactory erection
  - gradual or sudden onset
  - attempts at sexual activity

### DDx of Erectile Dysfunction

#### PENIS

Psychogenic  
Endocrine (DM2, testosterone)  
Neurogenic (DM2, post-operative)  
Insufficiency of blood (atherosclerosis)  
Substances

- quantify (see Table 22, FM31)
  - presence of morning or night time erections
  - stiffness (scale of 1-10)
  - ability to initiate and maintain an erection with sexual stimulation
  - erection stiffness during sex (scale of 1-10)
- qualify
  - partner or situation specific
  - loss of erection before penetration or climax
  - degree of concentration required to maintain an erection
  - percentage of sexual attempts satisfactory to patient and/or his partner
  - significant bends in penis or pain with erection
  - difficulty with specific positions
  - impact on quality of life and relationship

### Investigations

- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
  - psychological and/or psychiatric consultation
  - in-depth psychosexual and relationship evaluation
  - nocturnal penile tumescence and rigidity (NPTR) assessment
  - vascular diagnostics (e.g. doppler studies, angiography)

### Management

**Table 23. Management of Erectile Dysfunction**

Nonpharmacologic	Pharmacologic	Surgical
Lifestyle changes (alcohol, smoking, exercise)	Oral agents	Implants
Relationship/sexual counselling	Suppository	Vascular repair
Vacuum devices	Male urethral suppository for erection (MUSE)	Realignment
	Injections	

- pharmacologic treatment
  - phosphodiesterase type 5 inhibitors (see Table 24)
  - $\alpha$ -adrenergic blockers (e.g. yohimbine)
  - serotonin antagonist and reuptake inhibitor (e.g. trazodone)
  - testosterone – currently only indicated in patients presenting with hypogonadism and testosterone deficiency (note: breast/prostate cancer are absolute contraindications)

**Table 24. Phosphodiesterase Type 5 Inhibitors**

Examples	Dosing (1 dose/d)	Specifics	Side Effects	Contraindications
sildenafil (Viagra®)	25-100 mg/dose	Take 0.5-4 h prior to intercourse May last 24 h	Flushing, headache, indigestion	Not to be used in patients taking nitrates
tadalafil (Cialis®)	5-20 mg/dose	Effects may last 36 h	As above	As above
vardenafil (Levitra®)	2.5-20 mg/dose	Take 1 h prior to intercourse	As above	As above

#### The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction

*Arch Intern Med* 2011;171:1797-1803

**Study:** Meta-analysis of 6 RCTs.

**Population:** 740 male participants.

**Intervention:** Lifestyle modification and pharmacotherapy targeting CAD risk factors.

**Main outcome measure:** International Index of Erectile Dysfunction (IIEF-5) score.

**Results:** Lifestyle modifications and pharmacotherapy for cardiovascular risk factors had a statistically significant association with improved sexual function (weighted mean difference 2.66; 95% CI 1.86-3.47). Lifestyle modification without use of statins was also statistically significantly associated with improved sexual function (weighted mean difference 2.40; 95% CI 1.19-3.61).

**Conclusion:** Lifestyle modification alone or combined with pharmacotherapy can improve sexual function.

## Eye Complaints

- see [Ophthalmology](#), OP3, for *Vision Loss* and *Red Eye*

## Falls in the Elderly

- see [Geriatric Medicine](#), GM5

## Fatigue

### Epidemiology

- 25% of office visits to family physicians
  - peaks in ages 20-40
  - women 3-4x > men
- 50% have associated psychological complaints/problems, especially if <6 mo duration

#### Fatigue Red Flags

- Fever
- Weight loss
- Night sweats
- Neurological deficits
- Ill-appearing

## Differential Diagnosis

**Table 25. Differential Diagnosis of Fatigue: PS VINDICATE**

<b>P</b>	<b>Psychogenic</b>	<b>Depression, sleep disorder, life stresses</b> , anxiety disorder, chronic fatigue syndrome, fibromyalgia
<b>S</b>	Sedentary	Unhealthy/sedentary lifestyle, <b>obstructive sleep apnea</b>
<b>V</b>	Vascular	Stroke
<b>I</b>	<b>Infectious</b>	Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic
<b>N</b>	<b>Neoplastic</b>	Any malignancy
	Nutrition	<b>Anemia</b> (Fe deficiency, B <sub>12</sub> deficiency)
	Neurogenic	Myasthenia gravis, multiple sclerosis, Parkinson's disease
<b>D</b>	<b>Drugs</b>	β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics
<b>I</b>	Idiopathic	
<b>C</b>	Chronic illnesses	CHF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease
<b>A</b>	Autoimmune	SLE, RA, mixed connective tissue disease, polymyalgia rheumatica
<b>T</b>	Toxin	<b>Substance abuse</b> (e.g. alcohol), heavy metal
<b>E</b>	Endocrine	<b>Hypothyroidism, diabetes</b> , Cushing's syndrome, adrenal insufficiency, pregnancy

Common causes are in **bold**

## Investigations

- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical examination
- investigations should be guided by history and physical and may include:
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vit B<sub>12</sub>, serum protein electrophoresis, Bence-Jones, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

## Treatment

- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - quick followup for reassurance
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
  - prognosis: after 1 yr, 40% are no longer fatigued

## CHRONIC FATIGUE SYNDROME (CFS)

**Definition (CDC 2006)** – must meet both criteria

1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
  2. concurrent presence of at least 4 of the following symptoms for a minimum of 6 mo:
    - impairment of short-term memory or concentration, severe enough to cause significant decline in function
    - sore throat
    - tender cervical or axillary lymph nodes
    - muscle pain
    - multi-joint pain with no swelling or redness
    - new headache
    - unrefreshing sleep
    - post-exertion malaise lasting >24 h
- exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

## Epidemiology

- F>>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

## Etiology

- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

### Exercise Therapy for Chronic Fatigue

Cochrane Depression, Anxiety, and Neurosis Group  
Cochrane DB Syst Rev 2004;Issue 3

**Purpose:** To determine the effectiveness of exercise therapy for Chronic Fatigue Syndrome (CFS).

**Methods:** Systematic review of 5 RCTs with 336 patients of all ages with a clinical diagnosis of CFS.

**Interventions:** Exercise therapy alone was compared with treatment as usual (or relaxation and flexibility), pharmacotherapy (fluoxetine), or exercise therapy combined with either pharmacotherapy or patient education.

**Results:** At 12 wk, patients undergoing exercise therapy were less fatigued than controls (SMD -0.77; 95% CI, -1.26 to -0.28). Physical functioning was also significantly improved, but there were more dropouts with exercise therapy. Compared with fluoxetine, patients receiving exercise therapy were less fatigued (WMD -1.24; 95% CI, -5.31 to 2.83). Patients receiving combination therapy with exercise therapy and either fluoxetine or patient education, did better than those on monotherapy.

**Conclusions:** Patients may benefit from exercise therapy. Combination therapy with either fluoxetine or education may offer additional benefit. Further high quality trials are needed.

## Investigations

- no specific diagnostic laboratory tests

## Treatment

- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy, antihypertensive therapy

## Fever

- see [Pediatrics](#), P54, for fever in pediatric population

## Definition

- oral temperature  $>37.2^{\circ}\text{C}$  (AM),  $37.7^{\circ}\text{C}$  (PM)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is over the age of 5

**Table 26. Differential Diagnosis of Fever**

Infection	Cancer	Medications		Other
Bacterial	Leukemia	Allopurinol	Nifedipine	Irritable Bowel Syndrome
Viral	Lymphoma	Captopril	Phenytoin	Collagen-vascular disease
TB	Other Malignancies	Cimetidine	Diuretics	DVT
		Heparin	Barbiturates	
		INH	Antihistamines	
		Meperidine		

## History

- fever
  - peak temperature, thermometer, route, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - URTI: cough, coryza, ear pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
    - PE/DVT: swollen legs, pain in calf, shortness of breath, pleuritic chest pain
    - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, day care, contact with TB, foodborne, animals

## Investigations

- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- LP

## Management

- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

### Mean Body Temperature

- Oral =  $36.8^{\circ}\text{C}$
- Tympanic Membrane =  $36.4^{\circ}\text{C}$
- Rectal =  $37.2^{\circ}\text{C}$
- Diurnal Variation =  $0.5^{\circ}\text{C}$  higher at 4 pm vs. 6 am
- See [Pediatrics](#), P54 for normal temperature in children

## Joint Pain

- see [Rheumatology](#), RH3

**Table 27. Differential Diagnosis of Joint Pain**

Non-Articular		Articular	
Localized	Generalized	Inflammatory	Degenerative
Bursitis Tendonitis Capsulitis	Fibromyalgia Polymyalgia rheumatica	Seropositive <ul style="list-style-type: none"> <li>• Rheumatoid arthritis</li> <li>• Systemic lupus erythematosus</li> <li>• Scleroderma</li> <li>• Polymyositis</li> <li>• Sjogren's syndrome</li> </ul>	Primary <ul style="list-style-type: none"> <li>• Familial Heberden's node</li> <li>• Osteoarthritis</li> <li>• Regional hip or knee</li> </ul>
		Seronegative <ul style="list-style-type: none"> <li>• Ankylosing spondylitis</li> <li>• Inflammatory bowel disease</li> <li>• Psoriatic arthritis</li> <li>• Reactive arthritis</li> </ul>	Secondary <ul style="list-style-type: none"> <li>• Metabolic</li> <li>• Hemophilic</li> <li>• Neuropathic</li> <li>• Traumatic</li> </ul>
		Crystal <ul style="list-style-type: none"> <li>• Gout</li> <li>• Pseudogout</li> <li>• Milwaukee shoulder, calcific periarthritis</li> </ul>	
		Infectious <ul style="list-style-type: none"> <li>• Gonococcal</li> <li>• Non-gonococcal</li> </ul>	

### History

- number of joints involved: monoarticular, oligoarticular, polyarticular
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- trauma, infection, medications (steroids, diuretics)
- FHx of arthritis
- co-morbidities: diabetes mellitus (carpal tunnel syndrome), renal insufficiency (gout), psoriasis (psoriatic arthritis), myeloma (low back pain), osteoporosis (fracture), obesity (OA)
- constitutional symptoms (neoplasm)

### Physical Exam

- vitals
- specific joint exams
- systemic features (skin, nails, eyes, hands)

### Investigations

- CBC and differential, ESR, CRP, RF, ANA, HLA-B27, serum uric acid, calcium
- urinalysis
- tissue cultures
- x-ray
- joint aspirate for cell count + differential, culture, Gram stain, microscopy

### Treatment

- patient education including lifestyle modifications
- physiotherapy, occupational therapy
- manage pain (acetaminophen, NSAIDs)
- treat specific causes (antibiotics, DMARDs)

#### Signs and Symptoms of Inflammatory Arthritis

##### WARM(S) joints

Worse with rest, better with activity  
Awakening in the latter half of the night  
Redness around joint  
Morning stiffness (>30 min)  
Soft tissue swelling, erythema

#### Systemic Features

- Fever (SLE, infection)
- Rash (SLE, psoriatic arthritis)
- Nail abnormalities (psoriatic, reactive arthritis)
- Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
- Myalgias (fibromyalgia, myopathy)
- Weakness (polymyositis, neuropathy)
- GI symptoms (scleroderma, IBD)
- GU symptoms (reactive arthritis, gonococemia)

## Headache

- see [Neurology](#), N38

### Primary Headaches

**Table 28. Primary Headaches**

	Migraine	Tension-type	Cluster	Caffeine Withdrawal
<b>Epidemiology</b>	12% of adults F>M 20% with aura 80% without aura	38% of adults, can be episodic or chronic	<0.1% of adults, M>>F	~50% of people drinking >2.5 cups/d
<b>Duration</b>	5-72 h	May occur as isolated incident or daily, duration is variable	<3 h at same time of day	Begins 12-24 h after last caffeine intake, can last ~1 wk
<b>Pain</b>	Classically unilateral and pulsatile, but 40% are bilateral, moderate-severe intensity, nausea/vomiting, photo-/phonophobia	Mild to moderate pain, bilateral, fronto-occipital or generalized pain, band-like pain, ± contracted neck/scalp muscles, associated with little disability	Sudden, unilateral, severe, usually centered around eye, frequently awakens patient Associated conjunctival injection and tearing "Suicide" headache	Severe, throbbing, associated with drowsiness, anxiety, muscle stiffness, nausea, waves of hot or cold sensations
<b>Triggers</b>	Numerous (e.g. food, sleep disturbance, stress, hormonal, fatigue, weather, high altitude) Aggravated by physical activity	Stressful events, NOT aggravated by physical activity	Often alcohol	Discontinuing caffeine
<b>Treatment of Acute Headache</b>	1 <sup>st</sup> line: acetaminophen, ASA ± caffeine 2 <sup>nd</sup> line: NSAIDs 3 <sup>rd</sup> line: 5HT agonists ± antiemetic	Rest and relaxation NSAIDs	Sumatriptan Dihydroergotamine High-flow O <sub>2</sub> Intranasal lidocaine	Caffeine Acetaminophen or ASA ± caffeine
<b>Prophylactic Therapy</b>	1 <sup>st</sup> line: β-blockers 2 <sup>nd</sup> line: TCAs 3 <sup>rd</sup> line: anticonvulsants	Rest and relaxation, physical activity, biofeedback	Lithium carbonate, prednisone, methysergide	Cut down on caffeine

### Secondary Headaches

- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening
- etiology
  - aneurysm
  - space-occupying lesion
  - systemic infection (meningitis, encephalitis)
  - stroke
  - subarachnoid hemorrhage
  - systemic disorders (thyroid disease, hypertension, pheochromocytoma, etc.)
  - temporal arteritis
  - traumatic head injuries
  - TMJ or C-spine pathology
  - serious ophthalmological and otolaryngological causes of headache
- treatment
  - based on underlying disorder
  - analgesics may provide symptomatic relief

### Investigations

- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

#### Headache Red Flags

##### SN00P

Systemic symptoms or illnesses

- fever
- anticoagulation
- pregnancy
- cancer

Neurologic signs/symptoms

- impaired mental status
- neck stiffness
- seizures
- focal neurologic deficits

Onset

- sudden and severe
- new headache after age 50

Other associated conditions

- following head trauma
- awakens patient from sleep
- jaw claudication
- scalp tenderness
- worse with exercise, sexual activity or Valsalva

Prior headache history

- different pattern
- rapidly progressing in severity/frequency

#### Migraine Screen

##### POUND

Pulsatile quality

Over 4-72 h

Unilateral

Nausea and vomiting

Disabling intensity

if ≥4 present then a diagnosis is likely  
(+LR = 24)

#### Acupuncture for Migraine Prophylaxis

Cochrane DB Syst Rev 2009;4:CD001218

Study: Meta-analysis of 22 RCTs.

Population: 4419 participants with diagnosed migraine.

Intervention: Preventative treatment with acupuncture, sham acupuncture, no prophylactic treatment/routine care only, other interventions.

Main outcome measure: Proportion of responders in 3-4 mo. Other outcomes: frequency of migraine attacks, number of migraine days, headache frequency.

Results: Patients receiving acupuncture had higher response rates and fewer headaches after 3-4 mo than those with no prophylactic treatment or routine care only. There was no statistically significant difference between "true" vs. "sham" acupuncture.

Conclusion: Acupuncture is a viable prophylactic treatment option for migraine attacks. Selecting specific points for acupuncture is not as important as believed by practitioners.

## Hearing Impairment

- see [Otolaryngology](#), OT9

### Definition

- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

### Epidemiology

- 10% of the population is hard of hearing or deaf
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people over 65
- associated with significant physical, functional and mental health consequences

### Classification

- conductive (sound does not reach cochlea)
- sensorineural (sound is not converted or transmitted via neural signals)
- mixed

### Assessment

- infants
  - universal newborn hearing screening program
- elderly
  - whispered-voice test
    - ♦ whisper six test words 6 inches to 2 feet away from the patient's ear out of the visual field, ask patient to repeat the words (with non-test ear distraction)
  - tuning fork test
    - ♦ Rinne and Weber (not for general screening)
  - audioscope
    - ♦ delivers pure tone frequencies to obtain thresholds for frequencies of 250-8000 Hz

### Management

- counsel about noise control and hearing protection programs (grade A evidence)
- refer patients with hearing loss for a complete audiological examination
- hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life

#### Does this Patient have Hearing Impairment?

JAMA 2006;295:416-428

**Purpose:** To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.

**Study:** Evidence-based review of studies examining the accuracy or precision of screening questions and tests. 24 studies were included in this analysis.

**Conclusions:** Elderly patients who admit to having hearing impairment should be offered audiometry, while those who do not should undergo a whispered-voice test. Those who hear the whispered voice require no further testing, while those who do not require audiometry. The Weber and Rinne tests are not useful in screening for hearing impairment.

## Hypertension

Hypertension Guidelines are reviewed and updated annually.

For up to date recommendations, please see [www.hypertension.ca/chep](http://www.hypertension.ca/chep)

### Epidemiology

- 20-25% of Canadian adults have HTN (up to 50% undiagnosed)
- 16% of those diagnosed are well controlled
- approximately 50% of adult Canadians are hypertensive by age 60
- 3rd leading risk factor associated with death
  - risk factor for CAD, CHF, cerebrovascular disease, renal failure, peripheral vascular disease

### Definition

- hypertension
  - BP  $\geq 140/90$  mmHg, unless DM ( $\geq 130/80$  mmHg), or age  $\geq 80$  yr ( $\geq 150/90$  mmHg)
- isolated systolic hypertension
  - sBP  $\geq 140$  and dBP  $< 90$
  - associated with progressive reduction in vascular compliance
  - usually begins in 5<sup>th</sup> decade
- accelerated hypertension
  - significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy but without papilledema
- malignant hypertension
  - sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
  - not defined by absolute level of BP, but often requires BP of  $> 200/140$
- hypertensive urgency
  - sBP  $> 210$  or dBP  $> 120$  with minimal or no target-organ damage
- hypertensive emergency
  - high BP + acute target-organ damage

Symptoms of hypertension are usually NOT PRESENT (this is why it is called the "silent killer").

May have occipital headache upon awakening or organ specific complaints if advanced disease.

## Etiology

- essential (primary) hypertension (>90%)
  - undetermined cause
- secondary hypertension (10%), see Table 29
- watch for labile, “white coat” hypertension (office-induced elevated BP)

## Predisposing Factors

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male gender
- age >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

**Table 29. Causes of Secondary Hypertension**

	Common Cause		
<b>Renal</b>	Renovascular HTN Renal parenchymal disease, glomerulonephritis, pyelonephritis, polycystic kidney		
<b>Endocrine</b>	1° hyperaldosteronism Pheochromocytoma Cushing's syndrome Hyperthyroidism/hyperparathyroidism Hypercalcemia of any cause		
<b>Vascular</b>	Coarctation of the aorta Renal artery stenosis		
<b>Drug-induced</b>	Estrogens MAOIs Cocaine	Steroids Lithium Amphetamines	NSAIDs Decongestants Alcohol

## Investigations

- for all patients with hypertension
  - CBC, electrolytes, Cr, fasting glucose and lipid profile, 12-lead ECG, urinalysis
- for specific patient subgroups
  - DM OR renal disease: urinary protein excretion
  - increasing Cr OR history of renal disease OR proteinuria OR HTN resistant to 3 meds OR presence of abdominal bruit: renal ultrasound, captopril renal scan, MRA/CTA
  - if suspected endocrine cause: plasma aldosterone, plasma renin
  - if suspected pheochromocytoma: 24 h urine for metanephrines and catecholamines
  - ECG for left ventricular dysfunction assessment if indicated

### Hypertensive Emergencies

- Malignant HTN**
- Cerebrovascular:**
  - Hypertensive encephalopathy
  - CVA with severe hypertension
  - Intracerebral hemorrhage
  - SAH
- Cardiac:**
  - Acute aortic dissection
  - Acute refractory LV failure
  - Acute MI with persistent ischemic pain after CABG
- Renal:**
  - Acute glomerulonephritis
  - Renal crises from collagen vascular diseases
  - Severe hypertension following renal transplantation
- Excessive circulating catecholamines:**
  - Pheochromocytoma
  - Tyramine containing foods or drug interactions with MAOIs
  - Sympathomimetic drug use (e.g. cocaine)
  - Rebound HTN after cessation of anti-hypertensive drugs (e.g. clonidine)
- Eclampsia**
- Surgical:**
  - Severe HTN prior to emergent surgery
  - Severe post-op HTN
  - Post-op bleeding from vascular suture lines
- HTN following severe burns**
- Severe epistaxis**

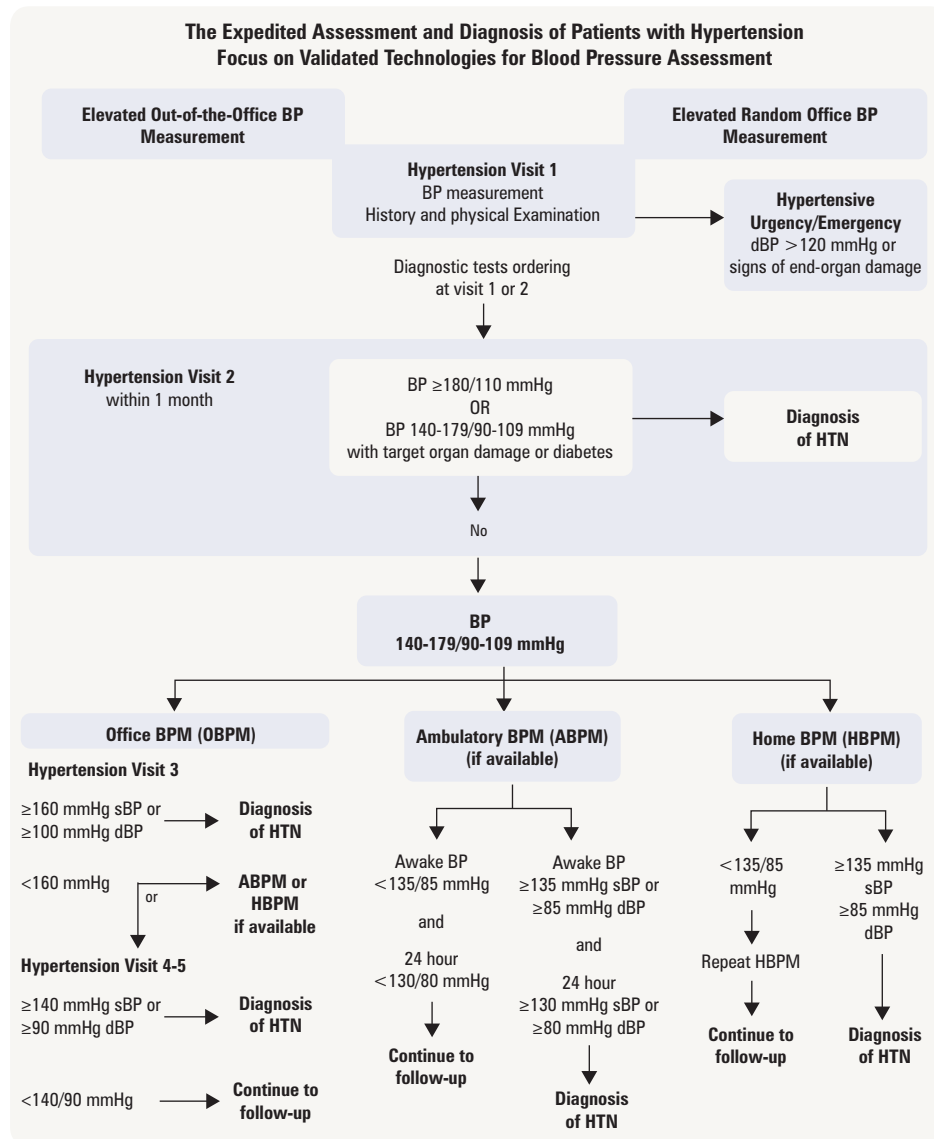

### Causes of Secondary Hypertension

#### ABCDE

Apnea, Aldosteronism  
 Bruits, Bad kidneys  
 Coarctation, Cushing's, Catecholamines,  
 Calcemia  
 Drugs  
 Endocrine disease

## Diagnosis

**Figure 12. Approach to hypertension** Adapted from: CHEP 2013 Guidelines

## Treatment

- target BP is <140/90 mmHg, <130/80 mmHg if DM
- lifestyle modification (in all HTN patients)
  - may be sufficient in patients with stage 1 HTN (140-159/90-99)
  - diet
    - ♦ follow Canada's Guide to Healthy Eating (see *Nutrition*, FM5) and Dietary Approaches to Stop Hypertension (**DASH**) (reduced cholesterol and saturated fats)
    - ♦ limit daily sodium intake to 65-100 mmol (1.5-2.3 g)
    - ♦ potassium/magnesium/calcium supplementations are NOT recommended for HTN
  - moderate intensity dynamic exercise: 30-60 min, 4-7 x/wk; higher intensity exercise is no more effective
  - smoking cessation
  - stress management
  - low-risk alcohol consumption (see *Alcohol*, FM12)
  - achieve and maintain a healthy BMI and waist circumference; BP will decrease by 4.0/2.8 mmHg for each 4.4 kg of weight loss; use multidisciplinary approach to weight loss
  - individualized cognitive behavioural interventions for stress management
- pharmacological
  - indications regardless of age (caution with elderly patients)
    - ♦ dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - ♦ dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - ♦ sBP ≥140 with target organ damage

### The Effects of Lifestyle Modification on Diet, Weight, Physical Fitness and Blood Pressure Control. 18-month Follow-up Results from the PREMIER Collaborative Research Group

*Ann Intern Med* 2006;144:485-495

**Purpose:** To compare effects of 2 lifestyle modification interventions compared to advice only on hypertension status, blood pressure, and lifestyle changes.

**Study:** Multicentre, randomized trial.

**Patients:** 810 adults with prehypertension or stage 1 hypertension (sBP 120-159, dBP 80-95).

**Interventions:** Multicomponent behavioural intervention using established recommendations ("established") arm, established recommendations plus the Dietary Approaches to Stop Hypertension (DASH) diet ("established + DASH") arm, and advice only arm.

**Main outcomes:** Lifestyle status and blood pressure.

**Results:** At 18 mo, absolute blood pressures were reduced for both intervention arms compared to advice only but differences were non-significant. The odds for HTN at 18 mo were reduced for both treatment arms compared to advice only. Statistically significant weight loss, fat intake and sodium intake were noted for both treatment arms.

### Dieting to Reduce Body Weight for Controlling Hypertension in Adults

*Cochrane DB Syst Rev* 2008;4:CD000484

A systematic review of 18 trials showed that weight-reducing diets in overweight hypertensive persons can affect modest weight loss in the range of 3-9% of body weight and are probably associated with modest blood pressure decreases of roughly 3 mmHg systolic and diastolic. Weight-reducing diets may decrease dosage requirements of persons taking antihypertensive medications.

- first line antihypertensives: thiazide, ACEI, ARB, CCB,  $\beta$ -blocker (if age <60)
- if partial response to standard dose monotherapy, add another first-line drug
- caution with combination of non-DHP CCB and  $\beta$ -blocker
- combination of ACEI and ARB is **not** recommended
- if still not controlled or adverse effects, can add other classes of anti-hypertensives

**Table 30. Pharmacologic Treatment of Hypertension in Patients with Unique Conditions**

Condition or Risk Factor	Recommended Drugs	Alternative Drugs	Not Recommended/Notes
<b>Isolated Diastolic HTN</b>	Thiazide diuretic, $\beta$ -blocker, ACEI, ARB, or long-acting CCB (consider ASA and statin in select patients)	Combinations of first-line drugs	$\beta$ -blocker monotherapy (age >60) or combination of ACEI with an ARB
<b>Isolated Systolic HTN</b>	Thiazide diuretic, ARB or long acting dihydropyridine CCB	Combinations of first-line drugs	Same as above
<b>Coronary Artery Disease</b>	ACEI or ARB; $\beta$ -blocker for patients with stable angina	Long acting CCB, when combination therapy for high risk patients, ACEI/ DHP CCB is preferred	Short-acting CCB (nifedipine) or ACEI + ARB is not recommended
<b>Prior MI</b>	$\beta$ -blocker + ACEI (ARB if can't tolerate ACEI)	Long-acting CCB	ACEI + ARB combination is not recommended
<b>Left Ventricular Hypertrophy</b>	ACEI, ARB, thiazide, or long-acting CCB	Combination of additional agents	Hydralazine and minoxidil can increase LVH, thus not recommended
<b>Cerebrovascular Disease (stroke/TIA)</b>	ACEI + diuretic	Combination of additional agents	ACEI + ARB combination after a stroke is not recommended
<b>Heart Failure</b>	ACEI (ARB if ACEI intolerant) and $\beta$ -blocker Spironolactone in patients with NYHA class II-IV	ARB in addition to ACEI. Hydralazine/isosorbide dinitrate combination if ARB or ACEI not tolerated/contraindicated Thiazide or loop diuretic is recommended as additive therapy	Non-DHP CCB not recommended Carefully monitor for side effects if using ACEI + ARB
<b>Dyslipidemias</b>	Does not affect initial treatment recommendations	Combination of additional agents	
<b>Diabetes Mellitus with Albuminuria (ACR &gt;2.0 mg/mmol in men and &gt;2.8 mg/mmol in women)</b>	ACEI or ARB	Add thiazide diuretic, cardioselective $\beta$ -blocker, long acting CCB	If serum Cr >150 $\mu$ mol/L, a loop diuretic should be considered instead of low-dose thiazide diuretic
<b>Diabetes Mellitus without Albuminuria (criteria listed above)</b>	ACEI, ARB, DHP CCB, or thiazide diuretic	Combination of first-line drugs or, first-line agents not tolerated, cardioselective $\beta$ -blocker or non-DHP CCB	ACEI + ARB combination not recommended
<b>Non-diabetic Chronic Kidney Disease with Proteinuria (urinary protein &gt;500 mg/24 h or ACR &gt;30 mg/mmol)</b>	ACEI (ARB if ACEI intolerant), diuretic as additive therapy	Thiazide for additive antihypertensive therapy, loop diuretic for volume overload	ACEI + ARB combination is not recommended
<b>Renovascular Disease</b>	Same as HTN without other indications		Caution in using ACEI or ARB – monitor for AKI
<b>Asthma</b>	K <sup>+</sup> -sparing + thiazide diuretic for patients on salbutamol		$\beta$ -blocker, unless specific indications like angina or post-MI
<b>Gout</b>			Thiazide, but asymptomatic hyperuricemia is not a contraindication
<b>Smoking</b>	Low dose thiazide ACEI		$\beta$ -blocker
<b>Pregnancy</b>	Methyldopa Hydralazine	Labetolol Nifedipine	ACEI
<b>Elderly (&gt;60)</b>	As for uncomplicated isolated diastolic HTN, except for use of $\beta$ -blocker		$\beta$ -blocker not recommended as first line treatment
<b>Emergency</b>	BP >169/90 = labetalol, nifedipine		
<b>If &gt;3 cardiovascular risk factors or established atherosclerotic disease</b>	Statin, ASA		Caution with use of ASA in patients with uncontrolled BP

Adapted from: McAlister FA, Zarnke KB, Campbell NRC, et al. The 2001 Canadian recommendations for the management of hypertension: Part two – Therapy. Can J Cardiol 2002;18:625-641 and The 2012 Canadian Hypertension Education Program Recommendations

**Calcium Channel Blockers****Dihydropyridine CCBs**

- amlodipine
- nifedipine
- felodipine

**Non-dihydropyridine CCBs**

- diltiazem
- verapamil

**How to Combine Antihypertensive Medications (in general)****Thiazides as First-Line Antihypertensive Therapy – ALLHAT**

JAMA 2002;288:2981-2997

**Study:** Randomized, double-blind, active-controlled clinical trial with mean follow-up of 4.9 yr.

**Patients:** 33,357 participants (mean age 67y, 53% male, 47% white) with stage 1 or 2 hypertension and at least one other CHD risk factor.

**Intervention:** Participants were randomly assigned to receive chlorthalidone (12.5-25 mg/d), amlodipine (2.5-10mg/d), or lisinopril (10-40 mg/d). Target BP was <140/90 mmHg, achieved by titrating the assigned study drug, and adding open-label agents when necessary.

**Outcomes:** The primary outcome was combined fatal CHD or non-fatal MI. Secondary outcomes were all-cause mortality, stroke, combined CHD, and combined CVD.

**Results:** There were no significant differences in either the primary outcome or all-cause mortality between treatment groups. For amlodipine vs. chlorthalidone, secondary outcomes were similar except for a higher 6-yr rate of heart failure with amlodipine (10.2% vs. 7.7%; p<0.001). For lisinopril vs. chlorthalidone, lisinopril had higher 6-yr rates of combined CVD (33.3% vs. 30.9%; p<0.001), stroke (6.3% vs. 5.6%; p=0.02) and heart failure (8.7% vs. 7.7%; p<0.001).

**Conclusion:** Thiazide-type diuretics are superior to CCB and ACEI for preventing one or more major forms of CVD, with similar risks of death and non-fatal MI.

**ACEI**

Not recommended as monotherapy in people of African descent.

**Follow-Up**

- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification → q3-6mo
- pharmacological
  - q1-2mo until BP under target for 2 consecutive visits
  - more often for symptomatic HTN, severe HTN, antihypertensive drug intolerance, target organ damage
  - q3-6mo once at target BP
- referral is indicated for cases of refractory hypertension, suspected secondary cause or worsening renal failure
- hospitalization is indicated for malignant hypertension

**Low Back Pain**

- see [Orthopedics](#), OR22
- see [www.bigbackpain.com](http://www.bigbackpain.com) for more information

**Definition**

- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

**Epidemiology**

- 5th most common reason for visiting a physician
- lifetime prevalence: 90%
- peak prevalence: age 45-60
- largest WSIB category
- most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

**Etiology**

- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes
  - pain is worse with movement, better with rest
  - sprain (ligament), strain (muscle), facet joint degeneration, disc degeneration/herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture, pregnancy
- 2% are non-mechanical causes
  - most concerning when pain is worse at rest and does not change with position
  - surgical emergencies:
    - ♦ cauda equina syndrome (areflexia, lower extremity weakness, decreased anal tone, saddle anesthesia, fecal incontinence, urinary retention), AAA (pulsatile abdominal mass)
  - medical conditions:
    - ♦ neoplastic (primary, metastatic, multiple myeloma)
    - ♦ infectious (osteomyelitis, TB)
    - ♦ metabolic (osteoporosis, osteomalacia, Paget's disease)
    - ♦ rheumatologic (ankylosing spondylitis, polymyalgia rheumatica)
    - ♦ referred pain (perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster)

**Physical Exam**

- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- posture, gait, ROM and peripheral pulses
- percussion of spine to illicit fracture or infection
- special tests
  - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

**Investigations**

- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

**Red Flags for Back Pain**

Bowel or bladder dysfunction  
Anesthesia (saddle)  
Constitutional symptoms/malignancy  
Chronic disease  
Paresthesias  
Age >50 and mild trauma  
IV drug use/Infection  
Neuromotor deficits

**Yellow Flags for Back Pain**

Psychosocial barriers to recovery that may indicate the risk of long-term disability and work loss

- Belief that pain and activity are harmful
- Negative or low mood, social withdrawal
- Problems with claim and compensation
- History of back pain, time off, and/or other claims
- Poor job satisfaction
- Overprotective family or lack of support
- Persistent pain for 4-6 wk with little to no improvement in symptoms

**Indications for Lumbar Spine X-ray**

- No improvement after 6 wk
- Fever >38°C
- Unexplained weight loss
- Prolonged corticosteroid use
- Significant trauma
- Progressive neurological deficit
- Suspicion of ankylosing spondylitis
- History of cancer (rule out metastases)
- Alcohol/drug abuse (increased risk of osteomyelitis, trauma, fracture)

### Treatment

- reassurance and education if no underlying serious condition
  - 70% improve in 2 wk, 90% in 6 wk
- conservative
  - limited bed rest (>2-4 d bed rest has no proven efficacy and potentially debilitating effects)
  - stay active and continue usual activities, including work, within limits of pain (leads to more rapid recovery and less chronic disability)
  - notes for work or WSIB to endorse “modified, appropriate work” vs. time off
  - heat or cold packs
  - massage may be beneficial, acupuncture may be a helpful adjunct
  - no proven efficacy of spinal traction, spinal manipulation, TENS
- pharmacological
  - preferably taken at intervals
  - acetaminophen (1st line), NSAIDs (2nd line)
  - short-term muscle relaxant use (<7 d) may be helpful (alone or in addition to NSAIDs), but are no better than NSAIDs and may cause drowsiness, dizziness, and dependency
  - do not prescribe opioids
- if no improvement after one month of conservative treatment, consider further investigations
  - imaging and appropriate screening in the presence of any red flags
- surgical evaluation if
  - suspected cauda equina syndrome or AAA
  - worsening neurologic deficit
  - intractable pain not responding to conservative treatment

**Table 31. Approach to Non-traumatic Low Back Pain**

	<b>Back dominant</b> (Pain greatest above gluteal fold)		<b>Leg dominant</b> (Pain greatest below gluteal fold)	
<b>History</b>	<b>Pattern 1</b> Worse with flexion Constant/intermittent	<b>Pattern 2</b> Worse with extension Never worse with flexion Always intermittent	<b>Pattern 3</b> Pain changes with back movement/position Currently/previously constant	<b>Pattern 4</b> Worse with activity Improves with rest and posture change Intermittent/short duration
<b>Physical Exam</b>	Normal neuro exam <u>Fast responder</u> • Improves with extension <u>Slow responder</u> • No change or worsens with extension	Normal neuro exam ± improves with flexion	Leg pain can improve but not disappear Positive straight leg raise ± conduction loss <u>Fast responder</u> • Improves with specific back position <u>Slow responder</u> • Not better with position changes	No irritative findings ± conduction loss
<b>Likely Pathology</b>	Arising from intervertebral discs or adjacent ligaments	Posterior joint complex (associated ligaments and capsular structures)	Sciatica	Neurogenic claudication
<b>Initial Management</b>	Scheduled extension Lumbar roll Night lumbar roll Medication as required	Scheduled flexion Limited extension Night lumbar roll Medication as required	Prone extension Supine “Z” lie Lumbar roll Night lumbar roll Medication as required	Abdominal exercises Night lumbar roll Sustained flexion Medication as required

Adapted from: American Academy of Orthopaedic Surgeons. Acute Care: Nontraumatic Low Back Pain. Orthopaedic Knowledge Update: Spine 2 2001;153-166

#### Massage for Low Back Pain

*Cochrane DB Syst Rev 2008;4:CD001929*

This meta-analysis of 13 randomized trials assessed the use of massage therapy for non-specific low back pain compared to other active or sham treatments.

**Reviewer's Conclusions:** For some patients with subacute or chronic non-specific low back pain, massage may be beneficial, especially with education and exercises. Some evidence suggests that acupuncture massage may be more effective than classic massage but more studies are required to confirm these results.

#### Spinal Manipulative Therapy for Low Back Pain

*Cochrane DB Syst Rev 2004;1:CD000447*

**Methods:** Systematic review of 39 RCTs that compared spinal manipulative therapy with other therapies for low back pain.

**Findings:** For acute and chronic low back pain, spinal manipulative therapy was superior only to sham therapy or therapies judged to be ineffective or even harmful. It had no statistical or clinical advantage over analgesics, physical therapy, exercises, back school, or physician care.

**Conclusions:** For acute and chronic low back pain, there is no evidence that spinal manipulative therapy is superior to other treatments.

#### Non-steroidal Anti-inflammatory Drugs for Low Back Pain

*Cochrane DB Syst Rev 2008;1:CD000396*

This systematic review of 65 randomized and double-blind controlled trials assessed the effects of NSAIDs in treating non-specific low back pain and whether one type of NSAID was more effective.

**Reviewer's Conclusions:** In acute and chronic low back pain without sciatica, NSAIDs are slightly effective for short-term symptomatic relief. There was no difference between NSAIDs and placebo in patients with acute sciatica. No specific type of NSAID appears to be better.

## Menopause/Hormone Replacement Therapy (HRT)

- see [Gynecology](#), GY32

### Epidemiology

- mean age of menopause = 51.4 yr
- a woman will spend over 1/3 of her life in menopause

### Clinical Features

- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- blood vessels and heart: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

## Management

- encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1200-1500 mg/d) and vitamin D (800-2000 IU/d)
- hormone replacement therapy (HRT)
  - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
  - regimens: cyclic estrogen-progestin, continuous estrogen-progestin, estrogen only (if no uterus), estrogen patch/gel/cream/ring/vaginal tablet
  - decreases risk of osteoporotic fractures, colorectal cancer
  - increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
- consider venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

## Osteoarthritis

- see [Rheumatology](#), RH5

## Epidemiology

- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

## Clinical Features

- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

## Investigations

- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

## Management

- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g. canes, orthotics, raised toilet seats)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs in the lowest effective dose for the shortest duration of time, along with gastroprotection; COX-2 selective inhibitors (celecoxib/Celebrex®, Meloxicam/Mobicox®) are recommended if long-term treatment or if high risk for serious GI problems
  - combination analgesics (e.g. acetaminophen and codeine)
  - intra-articular hyaluronic acid injections
  - intra-articular corticosteroid injections (no more than 3-4x/yr) may be helpful in acute flares (benefits last 4-6 wk, can be up to 6 mo)
  - topical NSAID (diclofenac/Pennsaid®)
  - capsaicin cream (Zostrix®)
  - oral glucosamine
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

- Hand (DIP, PIP, 1st CMC)
- Hip
- Knee
- 1st MTP
- L-spine (L4-L5, L5-S1)
- C-spine
- Uncommon: ankle, shoulder, elbow, MCP, rest of wrist

© Linda Colati

**Figure 13. Common sites of involvement in OA**

### Glucosamine Therapy for Treating Osteoarthritis

*Cochrane DB Syst Rev 2005;2:CD002946*

This meta-analysis of 25 single- and double-blinded randomized controlled trials with 4963 patients compared glucosamine treatment, administered by any route, against placebo or another treatment.

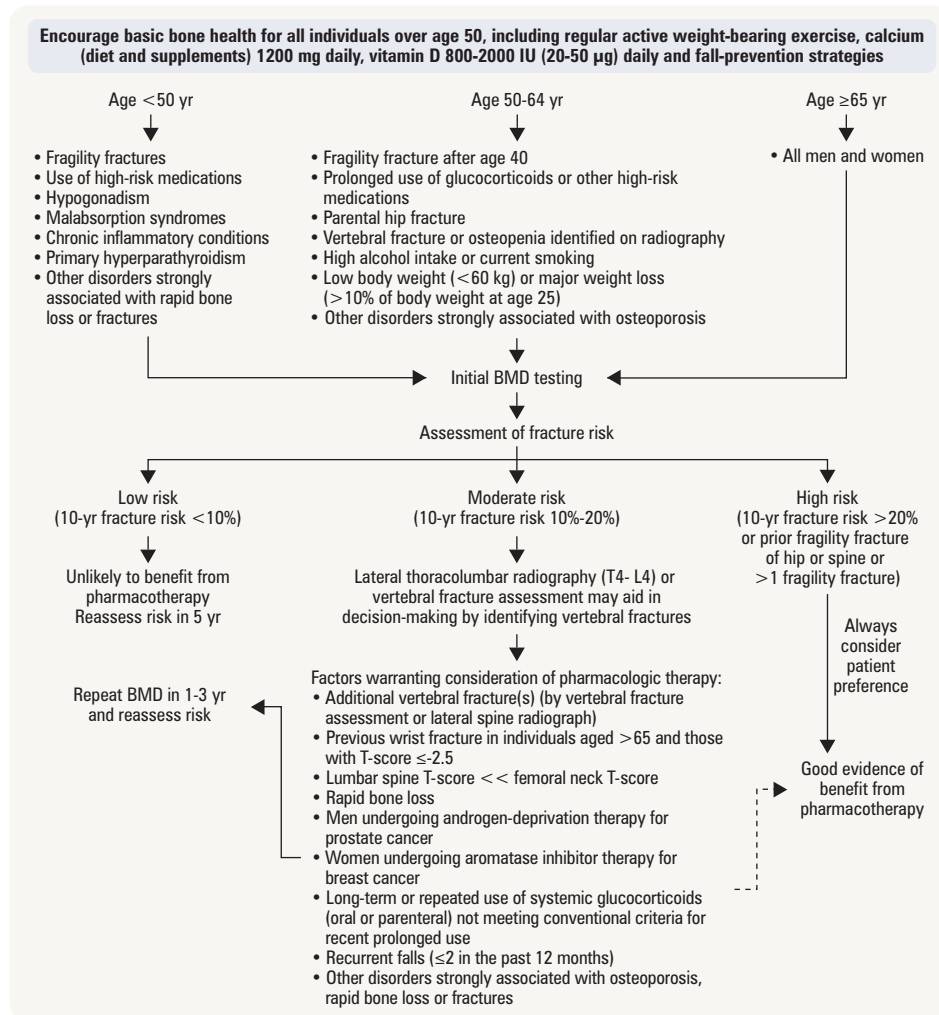

**Reviewer's Conclusions:** Glucosamine can decrease pain and functional impairment resulting from OA and is not associated with any side effects compared to placebo. Differences in the effectiveness of Rotta and non-Rotta preparations highlight variability between glucosamine preparations and patients should be made aware of this.

## Osteoporosis

- see [Endocrinology](#), E42

- for current guidelines see [www.osteoporosis.ca](http://www.osteoporosis.ca)
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- affects 1 in 4 Canadian women and 1 in 8 Canadian men

**Figure 14. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada (integrated management model).** Adapted from CMAJ 2010;182:1864-1873

### Management

- falls prevention: home safety assessment, optimize vision (e.g. cataract removal), consider hip protectors in older adults living in long-term care facilities
- exercise: weight-bearing, balance, and strengthening exercises as appropriate for the patient's age and functional capacity
- habits: smoking cessation, decrease alcohol intake
- diet: calcium 1200 mg/d through diet and supplements; vitamin D 400-1000 IU/d if healthy and at low risk of deficiency, 800-2000 IU/d if >50 yr and moderate risk of deficiency
- pharmacological
  - vertebral, hip, and non-vertebral fractures: bisphosphonates (alendronate, risedronate, zoledronate), monoclonal Ab (denosumab), estrogen (first line in women with menopausal symptoms)
  - vertebral fractures only: SERM (raloxifene)

**Table 32. First-line Therapies with Evidence for Fracture Prevention in Postmenopausal Women**

Type of Fracture	Antiresorptive Therapy						Bone Formation Therapy
	Bisphosphonates			Denosumab	Raloxifene	Estrogen	
	Alendronate	Risedronate	Zoledronate				Teriparatide
Vertebral	✓	✓	✓	✓	✓	✓	✓
Hip	✓	✓	✓	✓	–	✓	–
Non-vertebral	✓	✓	✓	✓	–	✓	✓

Adapted from CMAJ 2010;182:1864-1873

### Disorders Strongly Associated with Osteoporosis include:

Primary hyperparathyroidism, DM1, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD and chronic inflammatory conditions (e.g. IBD)

### 10-yr Fracture Risk Assessment

FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population

### How much Calcium do we Need?

Age	Calcium (mg)
4-8	1000 mg
9-18	1300 mg
19-50	1200 mg
>50	1200 mg
Pregnant and lactating women >18	1000 mg

### Calcium Content of Common Foods

- 1 cup milk = 300 mg
- ¾ cup yogurt = 332 mg
- ½ can salmon with bones = 240 mg
- ½ cup cooked broccoli = 33 mg
- 1 medium orange = 50 mg

### Vitamin D Content in Food

- Milk fortified with vitamin D<sub>3</sub> contains 100 IUs per 250 mL glass.
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish and fish oils (halibut and cod liver oils) all contain small amounts. Supplementation is necessary to obtain adequate levels as dietary intake has minimal impact.
- Most multivitamins provide 400 IUs of vitamin D<sub>3</sub>

- for postmenopausal women, ✓ indicates first-line therapies (grade A)
- for men, alendronate, risedronate, and zoledronate can be used as first-line therapies for prevention of fractures (grade D)
- non-vertebral fractures: hip, femur, pelvis, tibia, humerus, radius, clavicle
- estrogen can be used as first-line therapy in women with menopausal symptoms but the risks may outweigh the benefits (see [Gynecology](#), GY33)
- reflux, esophagitis, and esophageal ulcers are the major side effects of oral bisphosphonates

## Rash

- see [Dermatology](#), D5

### ATOPIC DERMATITIS

- clinical features
  - affects all ages but is more common in children
  - pruritus is the most common symptom; scratching worsens the rash, creating a vicious cycle
- treatment
  - goals: limit itching, repair skin
  - moisturizers, emollients, topical corticosteroids; oral corticosteroids and topical calcineurin inhibitors may be used

### SEBORRHEIC DERMATITIS

- clinical features
  - affects all ages but is most common in infants within the first 3 mo of life (e.g. pityriasis capitis or “cradle cap”) and adults age 30-60 yr
  - affects the scalp, central face, and anterior chest; often presents as scalp scaling (dandruff) in adolescents and adults
  - may cause mild to marked erythema of the nasolabial fold, often with greasy scaling
- treatment
  - topical antifungals, topical low-potency steroids; topical calcineurin inhibitors may be used

### ROSACEA

- clinical features
  - stages: (1) facial flushing, (2) erythema and/or edema and ocular symptoms, (3) papules and pustules, (4) rhinophyma
- treatment
  - topical or oral antibiotics, oral retinoids
  - laser treatment may be an option for progressive telangiectasis or rhinophyma
  - referral may be required to manage rhinophyma, ocular complications, or severe disease

### ACNE VULGARIS

- clinical features
  - types: (I) comedonal, (II) papular, (III) pustular, (IV) nodulocystic
  - predilection for the face, neck, upper chest, and back
- treatment
  - mild acne: topical treatments (antibiotics, benzoyl peroxide, retinoids)
  - moderate acne: after topical treatments have failed, add oral antibiotics and consider hormonal therapy
  - severe acne: consider systemic retinoids

### ONYCHOMYCOSIS (TINEA UNGUIUM)

- definition: fungal infection of the nail bed, matrix, or plate
- clinical features
  - occurs primarily in adults, most commonly after age 60 yr
  - crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris; toenails are affected more often than fingernails
- investigations
  - microscopy of subungual scrapings under KOH preparation, culture
- treatment
  - oral antifungals (terbinafine/Lamisil®, itraconazole/Sporanox®), topical antifungals (ciclopirox/Loprox®)

## Rhinorrhea

- see [Otolaryngology](#), OT22

### Differential Diagnosis

- common cold, sinusitis, influenza, strep pharyngitis, ear infection, vasomotor rhinitis
- allergies, contact with substances, tearing
- foreign body
- opioid withdrawal
- basilar skull fracture

### Investigations

- CBC, throat swab, nasopharyngeal swab, x-ray if injury, allergy testing

### Management

- nasal saline rinse
- consider medications: antihistamines, decongestants, corticosteroid nasal spray

## Sexually Transmitted Infections (STIs)

- see [Gynecology](#), GY26

### Definition

- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

### Epidemiology

- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes (increasing incidence of chlamydia and gonorrhea)
  - less common: hepatitis B, HIV and syphilis (both increasing in incidence), trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

### History

- sexual history
  - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, contraception, previous STIs and testing (including pap tests), partner communication regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

### Investigations/Screening

- individuals at increased risk, even those who are asymptomatic, should be screened for chlamydia, gonorrhea, hepatitis B, HIV, and syphilis
- Pap test if none performed in the preceding 12 mo

### Management

- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune, offer Gardasil® to women under age 26
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- an STI patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients should abstain from sexual activity until treatment completion and for 1 mo afterwards or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis

#### STI Risk Factors

- Sexually active males and females <25 yr old
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or >2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance abuse

When an STI is detected in a prepubertal child, evaluation for sexual abuse is mandatory.

#### Prophylactic Vaccination Against Human Papillomavirus Infection and Disease in Women: A Systematic Review of Randomized Controlled Trials

CMAJ 2007;177:469-479

**Purpose:** To evaluate prophylactic HPV vaccination in preventing high- and low-grade cervical lesions, persistent HPV infection, external genital lesions, adverse events, and death using meta-analysis.

**Studies:** 9 reports from 6 different trials with 40,323 patients were included and all studies were of high methodologic quality. Three studies used the quadrivalent vaccine, two used the bivalent, and one used a monovalent. The longest mean duration of follow-up was 48 mo.

**Results:** Prophylactic HPV vaccination decreased the frequency of high-grade cervical lesions caused by vaccine-type HPV strains compared to the control group (OR 0.14 (95% CI 0.09-0.21). Vaccinations also prevented persistent HPV infection, low-grade lesions and genital warts and the reported adverse events were mostly minor. Compared to placebo, there was no difference in serious adverse events or death.

**Conclusion:** Prophylactic HPV vaccination is highly efficacious in preventing infection and precancerous cervical disease in women aged 15-25 who have not previously been infected with vaccine-type HPV strains.

Table 33. Diagnosis and Treatment of Common STIs

	Signs and Symptoms	Investigations	Treatment	Complications
<b>Gonococcal Urethritis/Cervicitis</b> ( <i>Neisseria gonorrhoeae</i> )	M: urethral discharge, unexplained pyuria, burning, irritation F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex	M: urine PCR, urethral swab for gram stain and culture F: urine PCR, endocervical swab for gram stain and culture, vaginal swab for wet mount (to rule out trichomonas) M and F: Urine PCR	Ceftriaxone 250 mg IM single dose F/U in 3-4 wk for test of cure if symptoms persist	M: urethral strictures, epididymitis, infertility F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain M and F: Arthritis, increased risk of acquiring and transmitting HIV
<b>Non-Gonococcal Urethritis/Cervicitis</b> (Usually <i>Chlamydia trachomatis</i> **)	~70% asymptomatic If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above)	Same as above	Azithromycin 1 g PO single dose + gonococcal urethritis/cervicitis Rx* Same F/U as above	Same as above
<b>Human Papilloma Virus</b> (genital warts, cervical dysplasia)	Most are asymptomatic M: cauliflower lesions (condylomata acuminata) on skin/mucosa of penile or anal area F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva	None needed if simple condylomata Potential biopsy of suspicious lesions F: screening for cervical dysplasia through regular Pap smears	For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based) For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion	M and F: anal cancer MSM and F who have receptive anal sex: rectal cancer F: cervical/vaginal/vulvar cancer
<b>Genital Herpes</b> (HSV-1 and -2)	1° episode: painful vesiculocutaneous genital lesions ± fever, tender lymphadenopathy, protracted course Recurrent episodes: less extensive lesions, shorter course, may have "trigger factors"	Swab of vesicular content for culture, type-specific serologic testing for HSV-1 vs. HSV-2 antibodies and to determine 1° vs. recurrent episode	<u>1° episode:</u> Acyclovir 200 mg PO 5x/d x 5-10 d Famciclovir 250 mg PO tid x 5 d Valacyclovir 1000 mg PO bid x 10 d <u>Recurrent Episode:</u> Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d Famciclovir 125 mg PO bid x 5 d Valacyclovir 500 mg PO bid x 3 d or 1000 mg PO OD x 3 d	Genital pain, urethritis, cervicitis, aseptic meningitis, increased risk of acquiring and transmitting HIV
<b>Infectious Syphilis</b> ( <i>Treponema pallidum</i> )	1°: chancre (painless sore), regional lymphadenopathy 2°: rash and flu-like symptoms Latent Phase: asymptomatic 3°: neurologic, cardiovascular, and tissue complications	Specimen collection from 1° and 2° lesions, screen high risk individuals with serologic syphilis testing, universal screening of pregnant women	Benzathine penicillin G IM (dose depends on stage) Notify partners (last 3-12 mo) Continuous F/U and testing until patients are seronegative	Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV

M = Males; F = Females

\*N.B. if urethritis/cervicitis is suspected, always treat for both gonococcal and non-gonococcal types (i.e. ceftriaxone AND azithromycin)

\*\*Most common reportable STI in Canada

## Sinusitis

- see [Otolaryngology](#), OT24

### Etiology

- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*

### Management of Acute Sinusitis

- may provide symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants
- do not prescribe antihistamines
- intra-nasal corticosteroids if diagnosed with mild to moderate acute bacterial sinusitis
- antibiotics and intra-nasal corticosteroids if diagnosed with severe acute bacterial sinusitis
- ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, ≥4 episodes/yr, development of complications (e.g. mucocoele, orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis)

#### Sinusitis Score

- Maxillary toothache (1)
  - History of coloured nasal discharge (1)
  - No improvement with decongestants (1)
  - Abnormal transillumination (1)
  - Purulent secretion on exam (1)
- Other signs: nasal congestion, facial pain/pressure

#### Probability of Sinusitis By Score

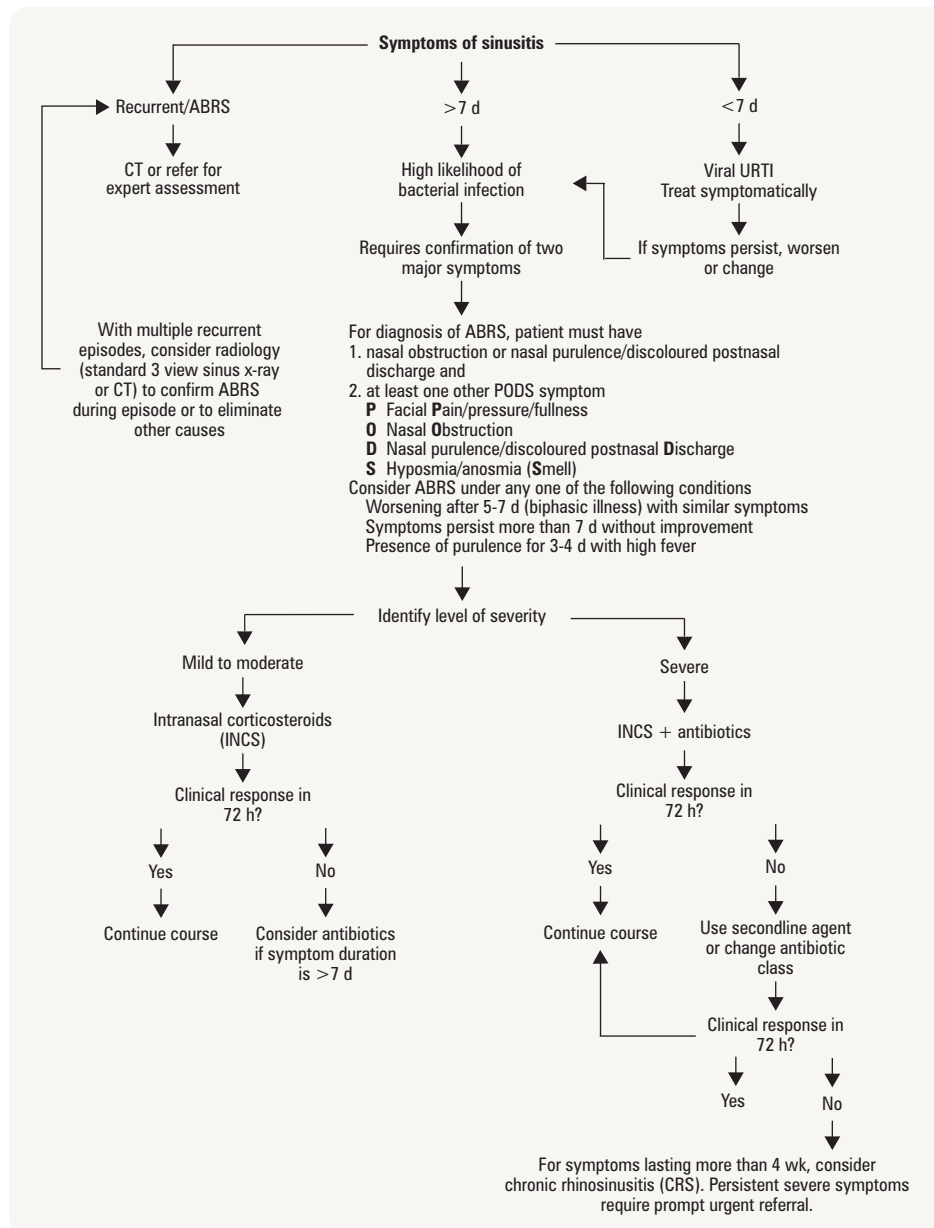

- 0 = 9%
- 1 = 21%
- 2 = 40%
- 3 = 63%
- 4 = 81%
- 5 = 92%

Ebell, MH. *Evidence-based diagnosis: a handbook of clinical prediction rules*. 2001.

#### Red Flags for Urgent Referral

- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or EOM
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intra-cranial complications (meningitis, intra-cranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (periorbital cellulitis, Pott's puffy tumour)

**Figure 15. Diagnosis and management of sinusitis**

ABRS = acute bacterial rhinosinusitis

## Sleep Disorders

- see [Respirology](#), R31 and [Neurology](#), N41

### Definition

- most often characterized by one of three complaints:
  - insomnia
    - ♦ difficulty falling asleep, difficulty maintaining sleep, early-morning wakening, non-refreshing sleep
  - parasomnias
    - ♦ night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
  - excessive daytime sleepiness

### Epidemiology

- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

## Etiology

- primary sleep disorders
  - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD
  - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy,  $\beta$ -agonists, antidepressants, steroids
  - psychiatric: especially mood and anxiety disorders
  - lifestyle factors: shift work

## Investigations

- complete sleep diary every morning for 1-2 wk
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

## Treatment

- treat any suspected medical or psychiatric cause
- psychologic treatment
  - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
  - exercise regularly, avoid heavy exercise within 3 h of bedtime
  - relaxation therapy: deep breathing, meditation, biofeedback
  - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
  - sleep restriction therapy: total time in bed should closely match the total sleep time of the patient (improves sleep efficacy)
  - CBT: address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
- pharmacologic treatment
  - short-acting benzodiazepines (e.g. lorazepam, oxazepam, temazepam) at the lowest effective dose should be used <7 consecutive nights to break cycle of chronic insomnia or to manage an exacerbation of previously controlled primary insomnia
  - non-benzodiazepines: zopiclone (Imovane®)
  - F/U every 2-4 wk initially (to reinforce behavioural interventions and renew/consider pharmacotherapy) then every 3 mo; if no progress or limited improvement, consider referral to sleep medicine program

## Specific Problems

- primary insomnia
  - majority of cases
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
- snoring
  - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - ♦ sleep on side (position therapy), weight loss
    - ♦ nasal dilators (noninvasive external dilator made with elastic adhesive backing applied over nasal bridge), tongue-retaining devices, mandibular advancement devices
  - at risk of developing obstructive sleep apnea
- obstructive sleep apnea (OSA)
  - apnea (no breathing for  $\geq 10$  s) resulting from upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present; leads to a distinctive snoring, choking, awakening type pattern as the body rouses itself to open the airway (resuscitative breath)
  - apneic episodes can last from 20 s to 3 min and occur 100-600 episodes/night
  - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per hour of sleep with arousal recorded
  - consequences
    - ♦ daytime somnolence, non-restorative sleep
    - ♦ poor social and work performance

### Risk Factors for Insomnia

- Older age
- Female
- Unemployed or less educated
- Separated or divorced
- Medical comorbidities
- Depression
- Anxiety
- Substance abuse

### Risk Factors for Snoring

- Male
- Obesity
- Alcohol consumption
- Smoking
- Use of tranquilizers or muscle relaxants

### Risk Factors for Obstructive Sleep Apnea

- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing). BMI >28 kg/m<sup>2</sup> present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history

- ♦ mood changes: anxiety, irritability, depression
- ♦ sexual dysfunction: poor libido, impotence
- ♦ morning headache (due to hypercapnia)
- ♦ HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
- ♦ pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
- ♦ memory loss, decreased concentration, confusion
- investigations
  - ♦ evaluate BP, inspect nose and oropharynx (enlarged adenoids or tonsils)
  - ♦ blood gas not helpful, TSH if clinically indicated
  - ♦ nocturnal polysomnography
- treatment
  - ♦ modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
  - ♦ primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
  - ♦ surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy and adenoidectomy (in children)
  - ♦ report patient to Ministry of Transportation if OSA is not controlled by CPAP
- central sleep apnea
  - definition
    - ♦ brain fails to send appropriate signals to the breathing muscles to initiate respirations
    - ♦ defining feature is absent respiratory effort
    - ♦ often secondary to CNS diseases: brainstem infarction, infection, neuromuscular disease
    - ♦ investigations: PFTs, nocturnal polysomnography, MRI
    - ♦ treatment: CPAP or mechanical ventilation (if brainstem origin)
    - ♦ prognosis: poor

## Sore Throat (Pharyngitis)

### Definition

- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

### Etiology

- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: group A  $\beta$ -hemolytic *Streptococcus* (GABHS), group C and G  $\beta$ -hemolytic *Streptococcus*, *Neisseria gonorrhoeae*, *Chlamydia pneumoniae*, *Mycoplasma pneumoniae*, *Corynebacterium diphtheriae*

### Epidemiology

- viral
  - most common cause, occurs year round
- bacterial
  - GABHS
    - ♦ most common bacterial cause
    - ♦ occurs most often in winter months
    - ♦ 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
    - ♦ most prevalent between 5-17 yr old

### Clinical Features

- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - EBV (infectious mononucleosis)
    - ♦ pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
  - coxsackie virus (hand, foot and mouth disease)
    - ♦ primarily late summer, early fall
    - ♦ sudden onset of fever, pharyngitis, headache, abdominal pain and vomiting
    - ♦ appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
    - ♦ ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
  - herpes simplex virus
    - ♦ like coxsackie virus but ulcers are fewer and larger
    - ♦ pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash

### Red Flags in Patients with "Sore Throat"

- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig's angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)

- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications: rheumatic fever, glomerulonephritis, suppurative complications (abscess, sinusitis, otitis media, cervical adenitis, pneumonia), meningitis, impetigo

### Investigations

- suspected GABHS
  - see Table 34 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
  - suspected EBV (infectious mononucleosis)
    - ♦ peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or “monospot”)

**Table 34. Modified Centor Score: Approach to Diagnosis and Management of GABHS**

POINTS					
Cough absent?	1				
History of fever >38°C?	1				
Tonsillar exudate?	1				
Swollen, tender anterior nodes?	1				
Age 3-14 yr?	1				
Age 15-44 yr?	0				
Age > 45 yr?	-1				
In communities with moderate levels of strep infection (10-20% of sore throats):					
Score	0	1	2	3	4 or more
Chance patient has strep	1-2.5%	5-10%	11-17%	28-35%	51-53%
Suggested action	NO culture or antibiotic		Culture all, treat with antibiotics only if culture is positive	Culture all, treat with antibiotics on clinical grounds <sup>1</sup> , discontinue antibiotics if culture comes back negative	

<sup>1</sup>Clinical grounds include a high fever or other indicators that the patient is clinically unwell and is presenting early in the course of the illness

Limitations: \*This score is not applicable to patients less than 3 yr of age

\*If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used

Adapted from: Centor RM et al. Med Decis Making 1981;1:239-46. McIsaac WJ, White D, Tannenbaum D, Low DE. CMAJ 1998;158:75-83

### Management

- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS (see Table 34)
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least one month or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT

# Complementary and Alternative Medicine (CAM)

## Epidemiology

- 50-75% of Canadians report some use of CAM over their lifetime, and only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

## Herbal Products

- over 50% of Canadians use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John's Wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - are you allergic to any plant products?
  - are you pregnant or breastfeeding?
- information resources: National Center for CAM ([www.nccam.nih.gov](http://www.nccam.nih.gov)), Health Canada website

**Table 35. Common Herbal Products**

Common Name	Reported Uses	Possible Adverse Effects	Possible Drug Interactions
<b>Black cohosh</b>	Menopausal symptoms, PMS, labour induction, arthritis	Hepatitis, liver failure, headaches, GI discomfort, heaviness in legs, weight problems	None reported
<b>Chamomile</b>	Mild sedative, anxiolytic, GI complaints, common cold	Allergic/contact dermatitis, anaphylaxis	Anxiolytics, sedatives
<b>Echinacea</b>	Common cold, flu, wound treatment, urinary tract infections, cancer	Hypersensitivity, hepatotoxicity with prolonged use, avoid use if immunosuppressed	Potentiates warfarin
<b>Evening primrose</b>	Dysmenorrhea, menopausal sx, inflammation, allergies, eczema, arthritis, MS	Headache, restlessness, nausea, diarrhea, may decrease seizure threshold	Anticoagulants, antiplatelets
<b>Feverfew</b>	Migraine prevention, rheumatoid arthritis, anti-inflammatory	Anxiety, upset stomach, skin rash, miscarriage	Anticoagulants, antiplatelets
<b>Flaxseed oil</b>	Laxative, menopausal sx, source of omega-3 fatty acids	Diarrhea	Do not take with other medications as fibre content can bind drugs
<b>Garlic</b>	Elevated lipids, hypertension, hyperglycemia, antimicrobial	GI irritation, contact dermatitis, may increase post-op bleeding	Anticoagulants, potentiates antihypertensives
<b>Ginger</b>	Nausea, motion sickness, dyspepsia, anti-inflammatory	Heartburn, not to be used for morning sickness	None known
<b>Ginkgo biloba</b>	Increases peripheral circulation (AD, dementia, intermittent claudication), premenstrual syndrome, vertigo	Headache, cramping, bleeding, mild digestive problems; reports of intracranial hemorrhage	Anticoagulants, thiazide diuretics, MAO inhibitors
<b>Ginseng</b>	Energy enhancer, decreases stress, adjunct support for chemotherapy/radiation	Hypertension, nervousness, insomnia, breakthrough bleeding, palpitations	Stimulant medications, antihypertensives, hormonal therapies
<b>Glucosamine (Chondroitin)</b>	Osteoarthritis	GI distress, headache, drowsiness, palpitations	Caution if shellfish allergy
<b>Saw palmetto</b>	BPH, adjunct to finasteride	Mild GI distress	$\alpha$ -adrenergics, finasteride
<b>St. John's Wort</b>	Mild to moderate depression	Photosensitivity, increased liver enzymes, drowsiness, dizziness, nausea, headaches	CNS depressants, C/I with indinavir
<b>Valerian root</b>	Sedative, anxiolytic, muscle relaxant, PMS	Drowsiness, headache, digestive problems, paradoxical insomnia	CNS depressants, antihistamines

References: Zink T, Chaffin J. Herbal "health" products: What family physicians need to know, *American Family Physician* 1998;58:1133-1140; NIH National Center for Complementary and Alternative Medicine website (<http://nccam.nih.gov>)

### Most Common Uses of CAM:

- Back/neck problems
- Gynecological problems
- Anxiety
- Headaches
- Digestive problems
- Chronic fatigue syndromes

### St. John's Wort for Depression

*Cochrane DB Syst Rev* 2005;2:CD000448

A meta-analysis of 37 trials, including 26 which compared St. John's Wort with placebo and 14 which compared St. John's Wort with standard antidepressants. The main outcome measure was the ratio of responders to non-responders, and the main outcome measure for adverse effects was the number of patients dropping out due to adverse experiences. Significant heterogeneity was noted among placebo-controlled trials, but trials were statistically homogeneous for trials comparing St. John's Wort with antidepressants. For major depression, compared with placebo, the OR for 6 larger trials was 1.15 (95% CI 1.02-1.29) and 5 smaller trials, 2.06 (95% CI 1.65-2.59). Compared with SSRIs and tricyclics, the response rates were 0.98 (95% CI 0.85-1.12) and 1.03 (95% CI 0.93-1.14), respectively. Fewer patients on St. John's Wort dropped out due to adverse effects compared to those taking tricyclics (OR 0.25; 95% CI 0.14-0.45), and a similar but non-significant trend was seen when compared with SSRIs (OR 0.60; 95% CI 0.31-1.15). Drawing solid conclusions is difficult given the degree of study heterogeneity and number of conflicting studies.

## Primary Care Models

Table 36. Primary Care Models

	Characteristics
<b>Comprehensive Care Model</b>	<ul style="list-style-type: none"> <li>FPs/GPs in solo practice with limited after-hours availability</li> <li>Payment model: fee-for-service</li> </ul>
<b>Family Health Team</b>	<ul style="list-style-type: none"> <li>Groups of health care professionals (e.g. FPs, GPs, RNs, NPs, dieticians, social workers)</li> <li>Wider range of services (e.g. rehabilitation, palliative care), with increased after-hours availability</li> <li>Receives provincial funding for allied health</li> <li>Payment model: paid annually per patient rostered depending on demographic category</li> </ul>
<b>Family Health Group</b>	<ul style="list-style-type: none"> <li>Group of <math>\geq 3</math> FPs, with some after-hours availability as well as on-call to telephone health advisory services</li> <li>Payment model: fee-for-service plus premiums</li> </ul>
<b>Family Health Network</b>	<ul style="list-style-type: none"> <li>Group of <math>\geq 3</math> FPs, can utilize nurse practitioners, with telephone health advisory services to provide around the clock primary care coverage</li> <li>Payment model: salary-based</li> </ul>
<b>Family Health Organization</b>	<ul style="list-style-type: none"> <li>Same as FHT but usually larger in scale in terms of personnel</li> </ul>

## Antimicrobial Quick Reference

Condition	Microorganisms	Antimicrobial
<b>RESPIRATORY/ENT</b>		
<b>Acute Rhinitis</b> (common cold)	Rhinovirus, Coronavirus, Influenza, RSV, Parainfluenza, Adenovirus	None

<b>Bronchitis</b>	Influenza, parainfluenza, coronavirus, rhinovirus, RSV	None
<b>Community Acquired Pneumonia: Outpatient without Comorbidity</b>	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>C. pneumoniae</i>	<u>1st line:</u> amoxicillin 1 g PO tid x 7-14 d (for patients over age 50 yr where mycoplasma infection is less likely) erythromycin 500 mg PO qid x 7-14 d clarithromycin 500 mg PO bid or 1000 mg (ER) PO OD x 7-14 d azithromycin 500 mg PO on 1st d then 250 mg PO OD x 4 d or 500 mg PO OD x 3 d <u>2nd line:</u> doxycycline 100 mg PO on 1st d then 100 mg PO OD x 7-14 d
<b>Community Acquired Pneumonia: Outpatient with Comorbidity</b>	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>C. pneumoniae</i> <i>H. influenza</i>	<b>ANY ONE of the <math>\beta</math>-lactam agents below:</b> amoxicillin 1000 mg PO tid x 7-14 d amoxicillin/clavulanate 500 mg PO tid or 875 mg PO bid x 7-14 d cefuroxime-AX 500 mg PO bid x 7-14 d cefprozil 500 mg PO bid x 7-14 d <b>PLUS ONE of the following:</b> clarithromycin 500 mg PO bid or 1000 mg (ER) PO OD x 7-14 d azithromycin 500 mg PO OD on 1st d then 250 mg PO OD x 4d doxycycline 100 mg PO bid on 1st d then 100 mg PO OD x 7-14 d <b>OR ANY ONE of the following:</b> levofloxacin 750 mg PO OD x 7-14 d moxifloxacin 400 mg PO OD x 7-14 d
<b>Dental Infections/ Periapical and Periodontal Abscesses</b>	Oral Flora	penicillin V potassium 500 mg PO qid x 7-10 d clindamycin 300 mg PO qid or 600 mg bid x 7-10 d
<b>GASTROENTEROLOGY</b>		
<b>Diarrhea – Enteritis</b>	Enterotoxigenic <i>E. coli</i> (ETEC) <i>Campylobacter</i> <i>Salmonella</i> <i>Shigella</i> Viruses Protozoa	<u>Mild to moderate</u> (i.e. <3 BM/d, no blood, no fever): OTC loperamide 4 mg PO STAT then 2 mg PO after each loose stool (max 8 doses/d) OTC bismuth subsalicylate (Pepto Bismol <sup>®</sup> ) 2 tabs or 30 mL repeat q30min prn (max 8 doses/d) (prevention: 2 tabs or 30 mL qid with meals and in the evening)  <u>Moderate to severe</u> (i.e. >3 BM/d, blood, fever): ofloxacin 400 mg PO single dose or 300 mg PO bid x 3 d (prevention: 300 mg PO OD) norfloxacin 800 mg PO single dose or 400 mg PO bid x 1-3 d (prevention: 400 mg PO OD) ciprofloxacin 750 mg PO single dose or 500 mg PO bid x 1-3 d (prevention: 500 mg PO OD) levofloxacin 500 mg PO OD x 1-3 d (prevention: 500 mg PO OD) azithromycin 1000 mg PO single dose or 500 mg PO OD x 1-3 d (children: 10 mg/kg/d x 3 d)  <i>Azithromycin:</i> Recommended primarily for Thailand, India, Nepal, and Indonesia where <i>Campylobacter</i> resistance to quinolones is high Considered drug of choice for children because of safety, tolerability, and ease of administration
<b>Diarrhea – post abx</b> (common with clindamycin)	<i>C. difficile</i>	<u>Mild to moderate</u> (WBC <5 x 10 <sup>9</sup> /L and Cr <1.5 x baseline): metronidazole 500 mg PO tid or 250 mg PO qid x 10 d (children: 15-30 mg/kg/d PO div tid-qid max 4 g/d)  <u>Severe</u> (WBC $\geq$ 15 x 10 <sup>9</sup> /L and Cr $\geq$ 1.5 x baseline): vancomycin 125 mg PO qid x 10-14 d (children: 40 mg/kg/d PO div tid-qid x 10-14d max 2 g/d)
<b>Peptic Ulcer Disease</b> (non-NSAID related)	<i>H. pylori</i>	<u>PPI:</u> lansoprazole 30 mg or omeprazole 20 mg or pantoprazole 40 mg or rabeprazole 20 mg  <u>1st line:</u> [PPI PO bid + amoxicillin 1000 mg PO bid + clarithromycin 500 mg PO bid x 7 d (e.g. HP-PAC: lansoprazole 30 mg PO bid + amoxicillin 1000 mg PO bid + clarithromycin 500 mg PO bid x 7 d)] [PPI PO bid + metronidazole 500 mg PO bid + clarithromycin 500 mg or 250 mg PO bid x 7 d] <u>2nd line:</u> [PPI PO bid + metronidazole 500 mg PO bid + amoxicillin 1000 mg PO bid x 7 d] [PPI PO bid + bismuth subsalicylate 2 tabs or 30 mL qid + metronidazole 250 mg PO qid + tetracycline 500 mg PO qid x 7-14 d]

Condition	Microorganisms	Antimicrobial
<b>GENITOURINARY</b>		
<b>UTI/Cystitis</b>	<i>Klebsiella</i> <i>E. coli</i> <i>Enterobacter</i> <i>Enterococci</i> <i>Proteus</i> <i>S. saprophyticus</i>	<p><u>1st line:</u> TMP/SMX 2 tabs bid or 1 DS tab bid x 3 d trimethoprim 100 mg PO bid or 200 mg PO OD x 3 d nitrofurantoin 50-100 mg PO qid or Macrobid® 100 mg bid x 5 d</p> <p><u>2nd line:</u> amoxicillin 500 mg PO tid x 7 d norfloxacin 400 mg PO bid x 3 d ciprofloxacin 250 mg PO bid or 500 mg (ER) OD x 3 d</p> <p>NB: high rate of amoxicillin resistance in community <i>E. coli</i>, use only after lab susceptibility obtained</p> <p><u>3rd line:</u> cephalexin 250-500 mg PO qid x 7 d levofloxacin 250 mg PO OD x 3 d</p> <p><u>Pregnancy:</u> cephalexin 250-500 mg PO qid x 7 d nitrofurantoin 50-100 mg PO bid x 5 d amoxicillin 500 mg PO tid x 7 d NB: nitrofurantoin is contraindicated in pregnancy after 36 wk</p>
<b>Head and Pubic Lice (crabs)</b>	<i>Pediculus humanus capitis</i> <i>Phthirus pubis</i>	permethrin cream 1%: apply as liquid onto washed hair for 10 min, then rinse; repeat in 1 wk
<b>Vulvovaginal Candidiasis</b>	<i>Candida</i>	Treat only if patient is symptomatic fluconazole 150 mg PO single dose miconazole 2% cream (Monistat 7®): one applicator (5 g) intravaginally qhs x 7 d
<b>Bacterial Vaginosis</b>	Overgrowth of: <i>G. vaginalis</i> <i>M. hominis</i> Anaerobes	If patient is asymptomatic, treatment is unnecessary unless high-risk pregnancy, prior IUD insertion, gynecologic surgery, induced abortion, or upper tract instrumentation. <u>1st line:</u> metronidazole 500 mg PO bid x 7 d metronidazole 0.75% gel: one applicator (5 g) intravaginally qhs x 5 d clindamycin 2% cream: one applicator (5 g) intravaginally qhs x 7 d <u>2nd line:</u> metronidazole 2 g PO single dose clindamycin 300 mg PO bid x 7 d
<b>Herpes</b>	Herpes simplex virus	<p><u>1° episode:</u> acyclovir 400 mg PO tid x 5-7 d famciclovir 250 mg PO tid x 5-7 d valacyclovir 500-1000 mg PO bid x 5-7 d</p> <p><u>Recurrent Episode:</u> acyclovir 400 mg PO tid x 5d or 800 mg PO bid x 5 d or 800 mg PO tid x 2 d famciclovir 125 mg PO bid x 5 d valacyclovir 500 mg PO bid x 3 d or 1000 mg PO OD x 3 d</p> <p><u>Pregnancy:</u> 1° episode: acyclovir 200 mg PO 5x/d x 5-10 d Prior infection within previous yr: acyclovir 200 mg PO qid at 36 wk valacyclovir 500 mg PO bid at 36 wk</p>
<b>Gonorrhea/Chlamydia</b>	<i>N. gonorrhoeae</i> <i>C. trachomatis</i>	ceftriaxone 250 mg IM x 1 dose + azithromycin 1 g PO single dose or doxycycline 100 mg PO bid x 7 d
<b>DERMATOLOGIC</b>		
<b>Mastitis</b>	<i>S. aureus</i> <i>S. pyogenes</i>	cloxacillin 500 mg PO qid x 7d cephalexin 500 mg PO qid x 7d
<b>Tinea Cruris/Pedis</b> (jock itch/athlete's foot)	Trichophyton	clotrimazole 1% cream bid ketoconazole 2% cream bid
<b>Uncomplicated Cellulitis</b>	<i>S. aureus</i> Group A <i>Strep</i>	<p><u>Children:</u> <u>1st line:</u> cephalexin 50-100 mg/kg/d div qid x 10-14 d <u>2nd line:</u> cloxacillin 50 mg/kg/d div qid x 10-14 d clindamycin 25 mg/kg/d x 10-14 d</p> <p><u>Adults:</u> <u>1st line:</u> cephalexin 500 mg PO qid x 10-14d <u>2nd line:</u> cloxacillin 500 mg PO qid x 10-14 d clindamycin 300 mg PO x 10-14 d</p>

Condition	Microorganisms	Antimicrobial
<b>OPHTHALMOLOGY</b>		
<b>Viral Conjunctivitis</b>	Adenovirus Coxsackievirus ECHO virus	None NB: very contagious
<b>Bacterial Conjunctivitis</b>	<i>S. aureus</i> <i>S. pneumoniae</i> <i>H. influenzae</i> <i>M. catarrhalis</i>	Duration is 5-7 d unless otherwise specified All doses should be administered while awake  OTC for adults and children age > 1 yr: gramicidin-polymixin drops (Polysporin® or Optimyxin®): 1 drop q3-4h bacitracin-polymixin ointment (Polysporin® or Optimyxin®): 1/2 inch qid  Prescription for adults and children age > 1 yr: erythromycin 0.5% ointment: 1/2-1 inch qid fucidin 1% drops (children age > 2 yr): 1 drop bid sulfacetamide sodium 10% drops: 1-2 drops q2-3h then taper to bid  Fluoroquinolones preferred for more serious cases, especially suspected <i>Pseudomonas</i> (e.g. contact lens wearers), corneal involvement, or treatment failure: besifloxacin 0.6% drops: 1 drop tid x 7 d ciprofloxacin 0.3% drops: 1-2 drops q2h x 2 d then q4h x 5 d ciprofloxacin 0.3% ointment: 1/2 inch bid-tid gatifloxacin 0.3% drops: 1-2 drops q2h x 2 d then qid x 5 d
<b>Blepharitis</b>	<i>S. aureus</i> <i>S. epidermidis</i> <i>P. acnes</i> <i>Corynebacteria</i>	<u>Lid hygiene</u> : Mainstay of treatment and works best OD or bid <u>Abx ointment</u> : Helpful in short-term of acute phase but resistance rapidly ensues if treatment is prolonged <u>1st line</u> : bacitracin-polymixin ointment (Polysporin® or Optimyxin®): 1/2 inch qhs erythromycin 0.5% ointment: 1/2 inch qhs <u>2nd line</u> : gentamicin 0.3% ointment: 1/2 inch qhs tobramycin 0.3% ointment: 1/2 inch qhs

\*All doses are adult doses unless otherwise specified

\*This chart is not all-encompassing and is non-inclusive of special exceptions (i.e. pregnancy, poor renal clearance, etc.)

\*Comorbidities includes COPD (received steroids within the last 3 mo), liver or renal disease, CHF, diabetes, malignancy, alcoholism, asplenia, immunosuppressing conditions, malnutrition, hospitalization in past 3 mo or nursing home

IBS	irritable bowel syndrome
INH	isoniazid
MRCP	magnetic resonance cholangiopancreatography
NAC	N-acetylcysteine
NAFLD	non-alcoholic fatty liver disease
NERD	non-erosive reflux disease
NMS	neuroleptic malignant syndrome
OGD	oesophagogastroduodenoscopy
PBC	primary biliary cirrhosis
PPI	proton pump inhibitor
PSC	primary sclerosing cholangitis
PTC	percutaneous transhepatic cholangiography
PUD	peptic ulcer disease
SBP	spontaneous bacterial peritonitis
TIPS	transjugular intrahepatic portosystemic shunt
UC	ulcerative colitis

## Anatomy Review

### Overview of Gastrointestinal Tract

- the gastrointestinal tract runs from mouth to anus ("gum to bum")

Figure 1. Overview of gastrointestinal tract

Table 1. Summary of Gastrointestinal Tract Structure and Function

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
<b>Esophagus</b>	<ul style="list-style-type: none"> <li>Muscular tube approximately 25 cm long with a diameter of 2 cm</li> <li>Extends from pharynx to the stomach</li> </ul>	<ul style="list-style-type: none"> <li>Arterial: left gastric artery and left inferior phrenic artery</li> <li>Venous: <ul style="list-style-type: none"> <li>Left gastric vein → portal venous system</li> <li>Esophageal veins → azygos vein → IVC (systemic)</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks)</li> <li>Sympathetic innervation via thoracic trunks of the greater splanchnic nerves</li> </ul>	<ul style="list-style-type: none"> <li>Mucosa: stratified squamous epithelium</li> <li>Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells</li> <li>Muscularis propria (muscularis externa): inner circular, outer longitudinal muscle <ul style="list-style-type: none"> <li>Upper 1/3: striated muscle</li> <li>Middle 1/3: transition zone</li> <li>Lower 1/3: smooth muscle</li> </ul> </li> </ul>
<b>Stomach</b>	<ul style="list-style-type: none"> <li>Delivers food to intestine for digestion and absorption</li> <li>Secretes acid, probably to reduce enteric infections/pneumonia; facilitate digestion of protein/iron/B<sub>12</sub></li> <li>Secretes intrinsic factor to facilitate B<sub>12</sub> absorption</li> <li>Minor contribution to initial protein digestion via pepsin</li> </ul>	<ul style="list-style-type: none"> <li>Lesser curvature: <ul style="list-style-type: none"> <li>Right and left gastric arteries (from celiac trunk)</li> </ul> </li> <li>Greater curvature: <ul style="list-style-type: none"> <li>Right and left gastromental (gastroepiploic) arteries (from gastroduodenal and splenic a. respectively)</li> </ul> </li> <li>Fundus: short and posterior gastric arteries (from the splenic artery)</li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via vagus nerve</li> <li>Sympathetic innervation via celiac plexus (from T6-T9)</li> </ul>	<ul style="list-style-type: none"> <li>5 parts: <ul style="list-style-type: none"> <li>Cardia</li> <li>Fundus</li> <li>Body</li> <li>Antrum</li> <li>Pylorus</li> </ul> </li> </ul>
<b>Duodenum</b>	<ul style="list-style-type: none"> <li>Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion</li> <li>Secretes cholecystokinin (CCK) to stimulate bile secretion</li> <li>Site of iron absorption</li> </ul>	<ul style="list-style-type: none"> <li>Branches of celiac artery and superior mesenteric artery (SMA)</li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via vagus nerve</li> <li>Sympathetic innervation via greater and lesser splanchnic nerves</li> </ul>	<ul style="list-style-type: none"> <li>4 parts <ul style="list-style-type: none"> <li>Superior (5 cm)</li> <li>Descending (7-10 cm)</li> <li>Horizontal (6-8 cm)</li> <li>Ascending (5 cm)</li> </ul> </li> <li>1st part is intraperitoneal; rest is retroperitoneal</li> </ul>

**Table 1. Summary of Gastrointestinal Tract Structure and Function** (continued)

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
<b>Jejunum</b>	<ul style="list-style-type: none"> <li>Absorption of salt, water and nutrients (protein, carbohydrates, fat, folic acid, and vit A, B, C, D, E, K)</li> </ul>	<ul style="list-style-type: none"> <li>Superior mesenteric artery</li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via fibers of the posterior vagal trunk</li> <li>Sympathetic innervation via fibers of T8-T10</li> </ul>	<ul style="list-style-type: none"> <li>Deep red colour</li> <li>2-4 cm in thickness</li> <li>Has a thick and heavy wall</li> <li>Plicae circulares are large, tall and closely packed</li> <li>Has long vasa recta</li> <li>Scant fat in mesentery</li> <li>Scant Peyer's patches</li> </ul>
<b>Ileum</b>	<ul style="list-style-type: none"> <li>Absorption of salt, water, nutrients, soluble vitamins (only site of vit B<sub>12</sub> absorption) and bile salt (entero-hepatic circulation)</li> </ul>	<ul style="list-style-type: none"> <li>Superior mesenteric artery</li> </ul>	<ul style="list-style-type: none"> <li>Same as jejunum</li> </ul>	<p>When compared to jejunum:</p> <ul style="list-style-type: none"> <li>Paler pink colour</li> <li>2-3 cm in thickness</li> <li>Has a thin and light wall</li> <li>Plicae circulares are small and sparse</li> <li>Contains more fat in mesentery than jejunum</li> <li>Has many Peyer's patches</li> </ul>
<b>Large Bowel</b>	<ul style="list-style-type: none"> <li>Absorption of water (5-10% of total water)</li> <li>Bacteria: further digestion of chyme and metabolism of undigested CHO to short chain fatty acids</li> <li>Formation and storage of feces</li> </ul>	<ul style="list-style-type: none"> <li>Branches of superior and inferior mesenteric arteries</li> <li>Rectal blood supply: sigmoid, right pudendal and rectal arteries</li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via vagus nerve</li> <li>Sympathetic innervation via greater and lesser splanchnic nerves</li> </ul>	<ul style="list-style-type: none"> <li>Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal</li> <li>Features include teniae coli, haustra, and omental appendices</li> </ul>
<b>Liver</b>	<ul style="list-style-type: none"> <li>Glucose homeostasis</li> <li>Plasma protein synthesis</li> <li>Lipid and lipoprotein synthesis</li> <li>Bile acid synthesis and secretion</li> <li>Vitamin A, D, E, K, B<sub>12</sub> storage</li> <li>Biotransformation, detoxification</li> <li>Excretion of compounds</li> </ul>	<ul style="list-style-type: none"> <li>2 sources               <ul style="list-style-type: none"> <li>Portal vein (75-80%)</li> <li>Hepatic artery (20-25%)</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Sympathetic innervation via fibers of the celiac plexus</li> <li>Parasympathetic innervation via fibers of the anterior and posterior vagal trunks</li> </ul>	<ul style="list-style-type: none"> <li>Largest internal organ</li> <li>Composed of 4 lobes (left, right, caudate, quadrate) and divided into 8 segments</li> </ul>
<b>Biliary Tract</b>	<ul style="list-style-type: none"> <li>Gallbladder functions to store and release bile that is produced in the liver</li> <li>Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids and bilirubin</li> <li>CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release</li> </ul>	<ul style="list-style-type: none"> <li>Cystic artery</li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via vagus nerve</li> <li>Sympathetic and visceral innervation via celiac nerve plexus</li> <li>Somatic afferent fibers via right phrenic nerve</li> </ul>	<ul style="list-style-type: none"> <li>Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct and ampulla of Vater</li> </ul>
<b>Pancreas</b>	<ul style="list-style-type: none"> <li>Endocrine function: islets of Langerhans produce glucagon, insulin and somatostatin (from the <math>\alpha</math>, <math>\beta</math> and <math>\delta</math> cells, respectively)</li> <li>Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin and carboxypeptidase</li> </ul>	<ul style="list-style-type: none"> <li>Anterior superior pancreaticoduodenal artery (from the celiac trunk)</li> <li>Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery)</li> <li>Dorsal pancreatic artery (from the splenic artery)</li> <li>Pancreatic veins drain into the portal, splenic and superior mesenteric veins</li> </ul>	<ul style="list-style-type: none"> <li>Parasympathetic innervation via vagus nerve</li> <li>Sympathetic innervation via abdominopelvic splanchnic nerves</li> </ul>	<ul style="list-style-type: none"> <li>4 parts of pancreas: head (includes uncinate process), neck, body, and tail</li> <li>(Major) Pancreatic duct connecting to common bile duct prior to ampulla of Vater</li> <li>Accessory pancreatic duct connecting directly to duodenum</li> </ul>

## Visualizing the GI Tract

- see also [Medical Imaging](#), MI10

### Esophagus, Stomach, Duodenum

- oesophagogastrroduodenoscopy (OGD): best visualization of mucosa; also allows for therapeutic intervention (banding varices, cauterizing/clipping/injecting bleeding ulcers, and dilating esophageal strictures)
  - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation)
  - endotracheal intubation first if massive upper GI bleed, acidosis or unable to protect airway

#### Retroperitoneal Structures

##### SAD PUCKER

Suprarenal glands (adrenal glands)  
 Aorta/IVC  
 Duodenum (second to fourth segments)  
 Pancreas (tail is intraperitoneal)  
 Ureters  
 Colon (only the ascending and descending branches)  
 Kidneys  
 Esophagus  
 Rectum

Only the ileum (not jejunum), can absorb vitamin B<sub>12</sub> and bile acids.

### Small Bowel

- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI enteroclysis increasingly available (use enteroclysis if dilation of the small bowel might improve sensitivity, such as diverticulosis, or if stricture suspected)
- “double balloon” enteroscopy (enteroscope with balloons proximally and distally to propel endoscope into jejunum from mouth or into ileum from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

### Colon and Terminal Ileum

- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis and severe colitis (increased risk of perforation)
- CT colonoscopy (“virtual colonoscopy”) more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon) and fistulae; increasing evidence for use in colorectal cancer screening

### Pancreatic/Biliary Duct

- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if endoscopic draining necessary, strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required

## Differential Diagnosis of Common Presenting Complaints

Table 2. Differential Diagnosis of Common Presenting Complaints

NAUSEA/ VOMITING	With Abdominal Pain		Without Abdominal Pain	
	Relieved by Vomiting	Not Relieved by Vomiting	Headache/Dizziness	No other Symptoms
	Gastric outlet obstruction Small bowel obstruction GERD (regurgitation more common)	Gallbladder disease Pancreatitis Myocardial infarction Hepatitis Infectious gastroenteritis	Cerebral tumour Migraine Vestibular disease Increased ICP	Drugs Uremia Pregnancy Metabolic (e.g. hypercalcemia) Gastroparesis (e.g. diabetes) Ketoacidosis
DYSPHAGIA	Mechanical (Solids)	Motility (Solids and Liquids)	Other	
	Peptic stricture/cancer Eosinophilic esophagitis Extrinsic compression Schatzki ring/esophageal web Zenker's diverticulum	Achalasia Diffuse esophageal spasm Scleroderma	Foreign Body Eosinophilic esophagitis	
ODYNOPHAGIA	Infection	Inflammation/Ulceration	Drugs	Other
	Candida Herpes CMV (common only in those who are immunosuppressed)	Caustic damage Eosinophilic esophagitis	Quinidine Iron Vitamin C Antibiotics (e.g. tetracycline) Bisphosphonates	Radiation
ABDOMINAL DISTENTION	Fluid (Ascites)		Flatulence	Other
	Portal HTN	Normal Portal Pressure		
	Cirrhosis Cardiac failure Hepatic vein thrombosis	Cancer (esp. ovarian) Pancreatitis TB	Functional bowel disease (e.g. IBS) Fibre Lactose intolerance Chewing gum (e.g. sorbitol, mannitol)	Constipation Colonic obstruction Dysmotility Pregnancy (fetus) Obesity (fat) Blood Large tumours (fatal growth)

#### Commonly Forgotten Causes of Vomiting

- Drugs
- Uremia
- CNS Disease
- Pregnancy

#### Differential Diagnosis of Abdominal Distention

- 6 Fs**  
 Fat  
 Feeces  
 Fetus  
 Flatus  
 Fluid  
 Fatal Growth

#### Acute Upper Abdominal Pain

Remember to rule out thoracic sources, e.g. myocardial infarction, pneumonia, dissecting aneurysm.

Table 2. Differential Diagnosis of Common Presenting Complaints (continued)

ACUTE ABDOMINAL PAIN	Upper/Mid-Abdomen	Lower Abdomen			
	Gastroenteritis Cholecystitis Perforated peptic ulcer Pancreatitis Small bowel obstruction Mesenteric ischemia Ruptured aortic aneurysm	Gastroenteritis Appendicitis Diverticulitis Crohn's disease Pelvic inflammatory disease Ectopic pregnancy			
CHRONIC/RECURRENT ABDOMINAL PAIN	Inflammatory	Neoplastic/Vascular	Toxin	Other	
	PUD Biliary colic IBD Chronic pancreatitis	Recurrent bowel obstruction Mesenteric ischemia Sickle cell anemia	Lead poisoning	Mittelschmerz Endometriosis Porphyria IBS Radiculopathy Abdominal wall pain syndrome	
ACUTE DIARRHEA	Inflammatory		Non-Inflammatory		
*Causes of bloody diarrhea	<b>Bacterial</b> <i>Shigella</i> * <i>Salmonella</i> * <i>Campylobacter</i> * <i>Yersinia</i> * <i>E. coli</i> (EHEC O157:H7)* <i>C. difficile</i>	<b>Protozoal</b> <i>E. histolytica</i> * (amebiasis) Strongyloides <b>Others</b> NSAIDs IBD* Ischemic*	<b>Bacterial</b> <i>S. aureus</i> <i>C. perfringens</i> <i>B. cereus</i> <i>E. coli</i> (ETEC, EPEC) <i>Salmonella enteritidis</i> <i>Vibrio cholera</i> <b>Protozoal</b> <i>Giardia lamblia</i>	<b>Viral</b> Rotavirus Norwalk CMV <b>Drugs</b> Antibiotics Colchicine Laxatives Antacids (magnesium)	
CHRONIC DIARRHEA	(a) Organic				(b) Functional
	Inflammatory	Secretory	Steatorrheic	Osmotic	
	IBD Infectious ( <i>C. difficile</i> , TB, CMV, HSV) Ischemic bowel Radiation colitis Neoplasia	Stimulant laxatives Post-ileal resection/cholecystectomy (bile salts) Bacterial toxins Vasculitis Neoplasia (Colon Ca, Carcinoid, VIPoma) Addison's disease Congenital syndromes	<i>Giardia lamblia</i> Celiac sprue Chronic pancreatitis Chronic cholestasis	Osmotic laxatives Lactose intolerance Chewing gum (sorbitol, mannitol)	IBS Constipation (overflow diarrhea) Anal sphincter dysfunction
CONSTIPATION: if no associated rectal bleeding/weight loss, etc., usually no cause found					
	Colorectal cancer Stricture Extrinsic compression Anal disease Rectocele	Medications (narcotics, antidepressants, calcium channel blockers) Metabolic (diabetes, thyroid, hypercalcemia)	Neurological (Parkinson's, multiple sclerosis, stroke) Collagen vascular disease (scleroderma, dermatomyositis)		
DYSPEPSIA	Common	Uncommon	Rare		
	Functional dyspepsia Drug side effect Peptic ulcer GERD	Angina Crohn's disease Cancer Gallstones Aerophagia	<i>Giardia lamblia</i> Malabsorption (celiac sprue)		
UPPER GI BLEED	Common	Uncommon	Rare		
	Ulcers ( <i>H. pylori</i> , ASA, NSAIDs) Esophageal varices Mallory-Weiss tears Erosive esophagitis Erosive gastritis	Tumours Arteriovenous malformation Dieulafoy's lesion Gastric antral vascular ectasia Portal hypertensive gastropathy	Aorto-enteric fistulas Hemobilia		
LOWER GI BLEED	Common	Uncommon	Rare		
	Diverticulosis Ischemia Angiodysplasia (elderly) Infectious Anorectal (hemorrhoids, fissure, ulcer)	Upper GI bleed (brisk) Post-polypectomy Radiation colitis IBD	Intussusception Vasculitides Stercoral ulcer Coagulopathies		

#### Obscure But Treatable Causes of Abdominal Pain

- Porphyria
- Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

Rule out IBD when patient presents with bloody diarrhea.

**Table 2. Differential Diagnosis of Common Presenting Complaints** (continued)

JAUNDICE (UNCONJUGATED BILIRUBIN)	Overproduction	Decreased Hepatic Intake	Decreased Conjugation
	Hemolysis Ineffective erythropoiesis (e.g. megaloblastic anemias)	Gilbert's syndrome Drugs (e.g. rifampin)	Drug inhibition (e.g. chloramphenicol) Crigler-Najjar syndromes type I and II Gilbert's syndrome Neonatal jaundice
JAUNDICE (CONJUGATED BILIRUBIN)	Impaired Hepatic Secretion		Extrahepatic Biliary Obstruction
	<b>Hepatocellular disease – by far the most common</b> Familial disorders (e.g. Rotor syndrome, Dubin-Johnson syndrome, cholestasis of pregnancy) Drug-induced cholestasis (e.g. oral contraceptives, chlorpromazine) Primary biliary cirrhosis (PBC) Primary sclerosing cholangitis (PSC) Sepsis Post-operative		<b>Intraductal obstruction:</b> Gallstones Biliary stricture Parasites Malignancy (cholangiocarcinoma) Sclerosing cholangitis <b>Extraductal obstruction:</b> Malignancy (e.g. pancreatic cancer, lymphoma) Metastases in peri-portal nodes <b>Inflammation (e.g. pancreatitis)</b>

## Esophagus

### Gastroesophageal Reflux Disease (GERD)

#### Definition

- condition in which the stomach contents (solid or liquid) leak backwards from the stomach into the esophagus (the tube from the mouth to the stomach)

#### Etiology

- inappropriate transient relaxations of lower esophageal sphincter (LES) – most common
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, increased intra-abdominal pressure
- acid hypersecretion (rare): Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see [General Surgery](#), GS22)

#### Clinical Features

- “heartburn” (pyrosis) and acid regurgitation (together are 80% sensitive and specific for reflux) ± sour regurgitation, water brash, sensation of a lump in the throat (bolus sensation) and frequent belching
- non-esophageal symptoms (see below) are increasingly recognized of being poor predictors of reflux

**Figure 2. Signs and symptoms of GERD**

#### Investigations

- usually a clinical diagnosis based on symptom history and relief following a trial of pharmacotherapy (proton pump inhibitor (PPI): symptom relief 80% sensitive for reflux)
- gastroscopy indications (*Ann Intern Med* 2012;157:808-816):
  - absolute indications:
    - heartburn accompanied by red-flags (bleeding, weight loss, etc.)
    - persistent reflux symptoms or previous severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
    - history of esophageal stricture with persistent dysphagia
- repeat endoscopy indicated only if known Barrett's (or recurrence of symptoms) because future likelihood of Barrett's and esophagitis is minimal if the first endoscopy is normal

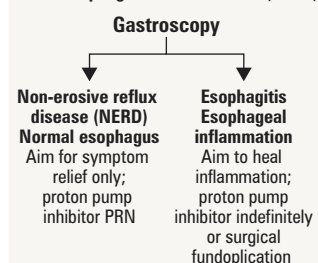

**Epigastric discomfort** = postprandial fullness, early satiety, epigastric pain or burning.

#### Foods/Substances that Aggravate GERD Symptoms

- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

#### Gastroesophageal Reflux Disease (GERD)

**Figure 3. Classification and gastroscopic findings of GERD**

Esophageal damage from reflux is most severe at first gastroscopy, therefore necessary only once for patients with NERD.

- esophageal manometry (study of esophageal motility)
  - may be done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure esophagus functional
  - surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to be successful if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24-h pH monitoring: most accurate test, but rarely required or performed
  - most useful if PPIs do not improve symptoms

### Management

- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- on-demand: antacids ( $\text{Mg}(\text{OH})_2$ ,  $\text{Al}(\text{OH})_3$ , alginate),  $\text{H}_2$ -blockers or PPIs can be used for NERD
- diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- dyspepsia may recur if therapy is discontinued

### Complications

- esophageal stricture disease – scarring can lead to dysphagia (solids)
- ulcer
- bleeding
- Barrett's esophagus (see below) and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

## Barrett's Esophagus

### Definition

- metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing intestinal metaplasia

### Etiology

- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

### Epidemiology

- in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett's esophagus
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia and long history of reflux symptoms

### Pathophysiology

- endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes to premalignant changes in abnormal columnar epithelium, characterized as low- or high-grade dysplasia

### Significance

- rate of malignant transformation is approximately 0.12% per year for all BE patients prior to dysplasia
- risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance
- increased gastric acid secretion is more frequently associated with Barrett's esophagus as opposed to reflux alone

### Management

- acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
- endoscopy every 3 yr if no dysplasia
- high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
- if low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options

Up to 25% of patients with Barrett's esophagus do not report symptoms of GERD.

**Updated Guidelines 2008 for the Diagnosis, Surveillance and Therapy of Barrett's Esophagus**  
*Am J Gastroenterol* 2008;103:788-797

- **Screening** of the general population is not recommended and needs to be individualized based on risk factors. Role of esophageal capsule endoscopy for screening is currently under investigation.
- **Surveillance** interval is based on grade of dysplasia. If no dysplasia confirmed on two endoscopies within the year, then q3y. For low grade dysplasia (LGD), repeat endoscopy within 6 mo to ensure there is no high grade dysplasia (HGD) and if none, then q1y until no dysplasia on two consecutive endoscopies. If HGD, repeat endoscopy within 3 mo to ensure there is no adenocarcinoma and recommend intervention (endoscopic resection) or intensive surveillance (endoscopy q3m).
- **Diagnosis** using alternative imaging techniques (fiberoptic, chromoendoscopy) and biomarkers (DNA content abnormalities, loss of heterozygosity or methylation of specific genes) are being investigated but none are currently ready for routine clinical use.
- **Treatment** of reflux symptoms with PPI decreases the development of dysplasia. Surgery (fundoplication) for patients without major co-morbidities and whose reflux symptoms are controlled on PPI has a 20% failure rate at 5 yr and has not shown to decrease progression to adenocarcinoma.
- **Prognosis**: 5 yr risk of esophageal adenocarcinoma in high grade dysplasia is >30%.
- **Management** in high grade dysplasia, surveillance with intensive biopsy, endoscopic ablation, or esophagectomy produce similar outcomes and thus should be individualized to patient preference and local expertise.

## Eosinophilic Esophagitis

### Definition

- inflammatory condition with prominence of eosinophils on esophageal biopsy
- most commonly found in children, but increasingly recognized in adults

### Etiology

- unknown; may be an “allergic” disorder in children
- cytokines cause edema and fibrosis

### Clinical Features

- odynophagia or dysphagia (solids); history often dates back to childhood
- first presentation may be to ER with food bolus impaction
- allergies common

### Investigations

- endoscopy may reveal multiple rings or “crepe-paper” appearance
- biopsy showing increased eosinophils is necessary to confirm diagnosis

### Management

- corticosteroid (e.g. fluticasone) spray (swallowed not inhaled)
- budesonide in a matrix to increase contact time with esophageal mucosa
- leukotriene B4 inhibitors (e.g. Montelukast)
- rule out food allergies: elimination diets have been an effective therapy in children

### Complications

- increased risk of perforation with endoscopic dilatation procedures

## Dysphagia

### Definition

- difficulty swallowing, sensation of food “sticking” after swallowing

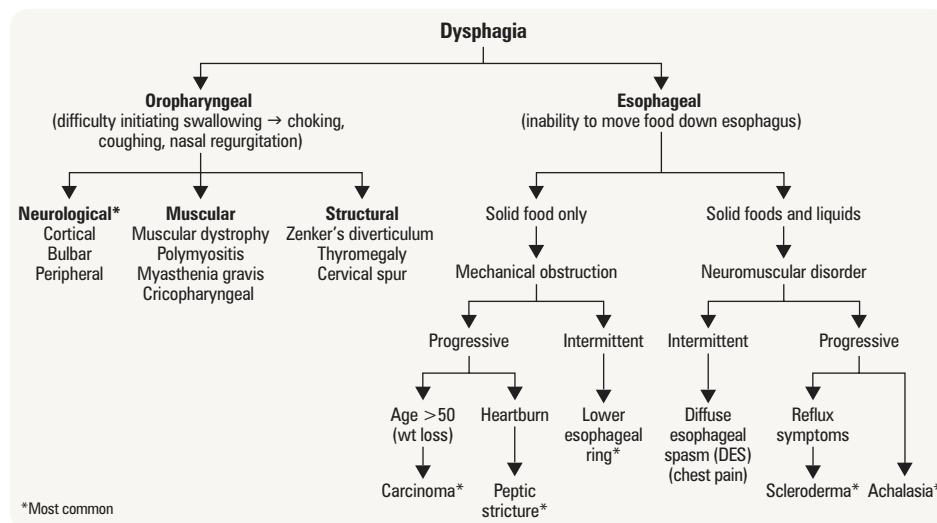

Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)

### Key Questions in Dysphagia

- Difficulty in starting swallowing?
- Associated symptoms? (regurgitation, change in voice pitch, weight loss)
- Solids, liquids or both?
- Intermittent or progressive?
- History of heartburn?
- Change in eating habits/diet?

Dysphagia = Difficulty in swallowing  
Odynophagia = Pain on swallowing

## Esophageal Motor Disorders

### Symptoms

- dysphagia with solids and liquids
- chest pain (in some disorders)

### Diagnosis

- motility study (esophageal manometry)
- barium swallow sometimes helpful

### Causes (Table 3)

- idiopathic
- achalasia (painless)
- scleroderma (painless)
- diabetes
- diffuse esophageal spasm (DES): rare and can be difficult to diagnose due to intermittent presentation

Table 3. Esophageal Motor Disorders

Disorder	Achalasia	Scleroderma	Diffuse Esophageal Spasm (DES)
<b>Definition</b>	<ul style="list-style-type: none"> <li>Failure of smooth muscle relaxation at LES</li> <li>Progressive loss of peristaltic function</li> </ul>	<ul style="list-style-type: none"> <li>See <a href="#">Rheumatology</a>, RH13</li> <li>Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening)</li> </ul>	<ul style="list-style-type: none"> <li>Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)</li> </ul>
<b>Etiology</b>	<ul style="list-style-type: none"> <li>Usually idiopathic</li> <li>2° or pseudo-achalasia: e.g. malignancy, Chagas disease (<i>Trypanosoma cruzi</i>)</li> </ul>	<ul style="list-style-type: none"> <li>Involves autoimmune, genetic, hormonal, and environmental factors</li> <li>Dysphagia: caused by reflux, dysmotility, or both</li> </ul>	<ul style="list-style-type: none"> <li>Idiopathic</li> </ul>
<b>Pathophysiology</b>	<ul style="list-style-type: none"> <li>Inflammatory degeneration of Auerbach's plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis</li> </ul>	<ul style="list-style-type: none"> <li>Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia</li> </ul>	<ul style="list-style-type: none"> <li>Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis</li> </ul>
<b>Diagnosis</b>	 <ul style="list-style-type: none"> <li>CXR: no air in stomach, dilated esophagus</li> <li>Barium studies: esophagus terminates in narrowing at LES ("bird's beak")</li> <li>Endoscopy: r/o malignancy</li> <li>Manometry: definitive diagnosis (signs listed above)</li> </ul>	<ul style="list-style-type: none"> <li>Clinical features of scleroderma</li> <li>Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus</li> </ul>	<ul style="list-style-type: none"> <li>Barium x-ray: "Corkscrew pattern"</li> <li>Manometry: &gt;30% (but &lt;100%) of esophageal contractions are aperistaltic</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>Dilatation of LES with balloon, ± GERD prophylaxis, 50% good response, can repeat, risk of perforation (5%)</li> <li>Injection of botulinum toxin into LES (temporary)</li> <li>Surgery (myomectomy)</li> </ul>	<ul style="list-style-type: none"> <li>Medical: aggressive GERD therapy (PPIs bid)</li> <li>Surgery: anti-reflux surgery (gastroplasty, last resort)</li> </ul>	<ul style="list-style-type: none"> <li>Reassurance not cardiac pain</li> <li>Medical: nitrates, calcium channel blockers, anticholinergics have variable benefit</li> <li>Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful); balloon dilatation</li> </ul>

## Esophageal Diverticula

### Definition

- outpouchings of one or more layers of the esophageal tract

### Clinical Features

- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

### Classification

- classified according to location
  - pharyngoesophageal (Zenker's) diverticulum
    - most frequent form of esophageal diverticulum
    - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
    - symptoms: dysphagia, regurgitation of undigested food, halitosis
    - treatment: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac
  - mid-esophageal diverticulum
    - secondary to mediastinal inflammation, motor disorders
    - usually asymptomatic; no treatment required
  - just proximal to LES (pulsatile type)
    - usually associated with motor disorders
    - usually asymptomatic; no treatment required

## Peptic Stricture (from Esophagitis)

- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

### Treatment

- endoscopic dilatation and indefinite PPI
- anti-reflux surgery if above treatment unsuccessful

## Esophageal Carcinoma

- see [General Surgery](#), GS14

## Webs and Rings

- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

### Clinical Features

- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Plummer-Vinson (or Patterson-Kelly syndrome)
  - upper esophageal web with iron deficiency, plus cheilosis (dry scaling and fissuring of the lips) and koilonychia (concave outer nail surface)
  - usually in middle-aged females (>40 yr)
  - elevated risk of hypopharyngeal carcinoma
- Schatzki's ring
  - mucosal ring at squamo-columnar junction above a hiatus hernia
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic bougie

#### Plummer-Vinson Syndrome Triad

- Fe Deficiency anemia
- Dysphagia
- Esophageal webs

## Infectious Esophagitis

### Definition

- severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

### Risk Factors

- diabetes
- chemotherapeutic agents
- immunocompromised states

### Symptoms

- characteristically odynophagia, less often dysphagia
- diagnosis is via endoscopic visualization and biopsy

### Appearance

- *Candida* (most common): whitish-yellow plaques without visible ulceration or inflammation
- Herpes (second most common), CMV: focal ulcers

### Treatment

- *Candida*: nystatin swish and swallow, ketoconazole, fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV ganciclovir, famciclovir or oral valganciclovir

#### Red Flags of Dyspepsia

(raise suspicion of gastric malignancy):

- Unintended weight loss
- Persistent vomiting
- Progressive dysphagia
- Odynophagia
- Unexplained anemia or iron deficiency
- Hematemesis
- Jaundice
- Palpable abdominal mass or lymphadenopathy
- Family history of upper GI cancer
- Previous gastric surgery

## Stomach and Duodenum

## Dyspepsia

### Definition

- intermittent epigastric discomfort, characteristically develops after eating

### History and Physical

- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical examination: adenopathy, abdominal mass/organomegaly, Carnett's sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

### Investigations

- laboratory: usual (CBC, liver enzymes, glucose, Cr, etc.) plus amylase, albumin
- consider trial of empiric anti-secretory drug therapy, non-invasive testing for *H. pylori* infection, endoscopy, barium radiography

The most common cause of dyspepsia is functional (idiopathic) dyspepsia  
"Neither clinical impression nor computer models can adequately distinguish between organic disease and functional disease in patients referred for endoscopic evaluation of dyspepsia."

JAMA 2006;295:1566-1576

#### Key Questions to Ask

- Dysphagia
- Weight Loss

Gastric Acid Secretion

Stomach

- primary function is mechanical grinding of food facilitating early enzymatic digestion into chyme and propulsion into duodenum

Table 4. Cells of the Gastric Mucosa

Cell Type	Secretory Product	Important Notes
Parietal cells	Gastric acid (HCl) Intrinsic factor	Stimulated by histamine, ACh, gastrin
Chief cells	Pepsinogen	Stimulated by vagal input and local acid
G-cells	Gastrin	Stimulates H <sup>+</sup> production from parietal cells
Superficial epithelial cells	Mucus, HCO <sub>3</sub> <sup>-</sup>	Protect gastric mucosa
Neuroendocrine cells	Multiple (e.g. somatostatin, inhibits cell secretion)	Involved in neural, hormonal and paracrine pathways

Figure 5. Stimulation of H<sup>+</sup> secretion from the parietal cell

Gastritis

Definition

- defined histologically: inflammation of the stomach mucosa

Etiology

- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

Table 5. Updated Sydney Classification of Gastritis

Type	Common Etiology
<b>Acute Gastritis</b>	
Hemorrhagic/erosive gastritis	Alcohol*, Aspirin®/NSAID*, shock/physiological stress* (seen in ICU patients)
Helicobacter gastritis	Helicobacter pylori*
<b>Chronic Gastritis</b>	
Non-atrophic	Helicobacter pylori*
Atrophic	Helicobacter pylori*, dietary, environmental factors (multi-focal), autoimmunity
Chemical	NSAID*, bile
Radiation	Radiation injury
Lymphocytic	Celiac disease, drug
Eosinophilic	Food allergies
Non-infectious granulomatous	Crohn's disease, sarcoidosis
Other infectious gastritis	Bacteria, viruses, fungi, parasite, TB, syphilis

\*Most common causes

### Clinical Features

- non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn's Disease); difficult to diagnose clinically or endoscopically
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

### Management

- determined by etiology (see *H. Pylori* section, G13, *NSAID* section, G14 and *Stress-Induced Ulceration* section, G14)
- non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs and foods that trigger symptoms

## Peptic Ulcer Disease (PUD)

### Definition

- focal defects in the mucosal that penetrate the muscularis mucosa layer results in scarring (defects superficial to the muscularis mucosa have erosions and no scarring)
- peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

### Etiology

**Table 6. Etiology of Peptic Ulcer Disease**

	Duodenal	Gastric
<i>H. pylori</i> infection	90%	60%
NSAIDs	7%	35%
Physiologic stress-induced	<3%	<5%
Zollinger-Ellison (ZE) syndrome	<1%	<1%
Idiopathic	15%	10%

- NSAID negative, *H. pylori* negative ulcers becoming more commonly recognized
- others: CMV, ischemic, idiopathic
- alcohol: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with tobacco, cirrhosis of liver, COPD and chronic renal failure

### Clinical Features

- dyspepsia: most common presenting symptom
  - only 20% of patients with dyspepsia have ulcers, while most have functional disease
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery) (see *Bleeding Peptic Ulcer*, G13)
  - perforation 2% (usually anterior ulcers)
  - gastric outlet obstruction 2%
  - penetration (posterior) 2%; may also cause pancreatitis
- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  - epigastric pain; may localize to tip of xiphoid
  - burning
  - develops 1-3 h after meals
  - relieved by eating and antacids
  - interrupts sleep
  - periodicity (tends to occur in clusters over wk with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

### Investigations

- endoscopy (most accurate)
- upper GI series
- *H. pylori* tests (see Table 7)
- fasting serum gastrin measurement if Zollinger-Ellison (ZE) syndrome suspected

### Treatment

- specific management depends on etiology; (see *H. Pylori* section, G13, *NSAID* section, G14 and *Stress-Induced Ulceration* section, G14)
- eradicate *H. pylori* if present, chief advantage is to lower ulcer recurrence rate
- stop NSAIDs if possible
- start PPI: inhibits parietal cell  $H^+/K^+$ -ATPase pump which secretes acid
  - heals most ulcers, even if NSAIDs are continued
- other meds (e.g. histamine  $H_2$ -antagonists) less effective
- discontinue tobacco
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol and spices

#### Gastric vs. Duodenal Ulcers

Gastric ulcers must always be biopsied to rule out malignancies. Duodenal ulcers are rarely malignant.

#### Approach to PUD

- Stop NSAIDs
- Acid neutralization
- *H. pylori* eradication
- Quit smoking

#### Cigarette Smoking and PUD

- Increased risk of ulcer
- Increased risk of complications
- Increased chance of death from ulcer
- Impairs healing

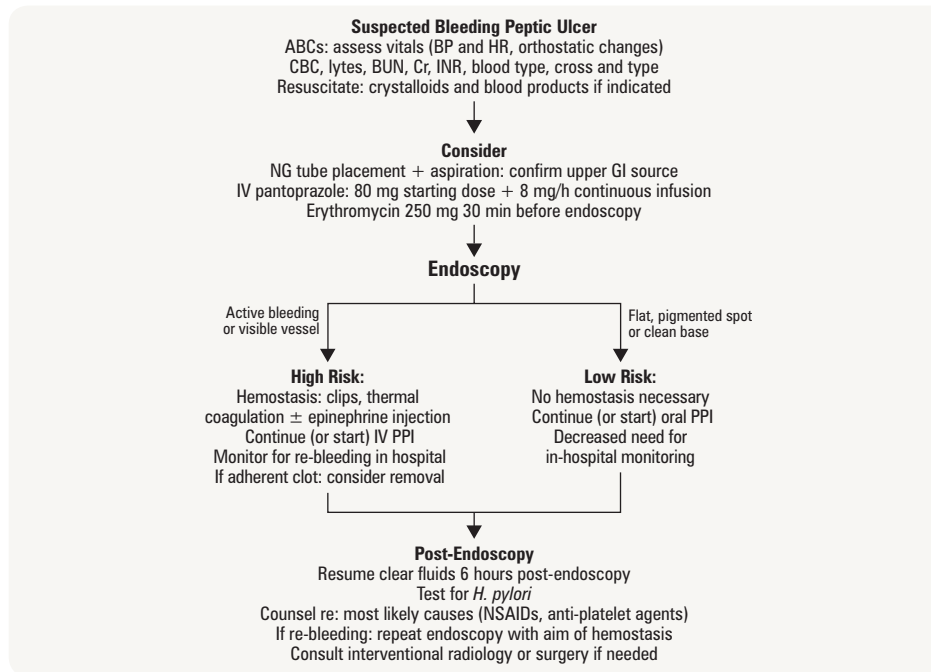

#### Bleeding Peptic Ulcers: Risk Factors for Increased Mortality

- Co-existent illness
- Hemodynamic instability
- Age > 60 yr
- Transfusion required

### Management of Bleeding Peptic Ulcers

- OGD to explore upper GI tract (see Figure 6)
- establish risk of rebleeding/continuous bleed
  - clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
    - ♦ if high risk, consider ICU admission

**Figure 6. Approach to management of suspected bleeding peptic ulcer**

Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. NEJM 2008;359:928-937

#### Intragastric pH with Oral vs. Intravenous Bolus plus Infusion Proton-pump Inhibitor Therapy in Patients with Bleeding Ulcers

Gastroenterology 2008;134:1836-1841

**Study:** Randomized control trial.

**Participants:** Patients presenting with overt bleeding from an ulcer.

**Intervention:** Patients received either IV lansoprazole (90 mg bolus followed by 9 mg/h infusion; n=32) or oral lansoprazole (120 mg bolus followed by 30 mg every 3 h; n=34).

**Primary Outcome:** 24 h pH.

**Results:** Intragastric pH was >6 for >60% of the study period in 22 (68.8%) patients receiving IV and 22 (64.7%) patients receiving oral PPI. At 1 h, mean pHs for IV and oral were 5.3 and 3.3, respectively (difference 2.0; P=0.001). After 1.5 h, there were no differences in mean pH between the groups. Mean pH rose above 6 after 2-3 h of IV PPI and 3-4 h of oral PPI.

**Conclusion:** Frequent oral PPI may be able to replace the currently recommended IV bolus plus infusion PPI therapy in patients with bleeding ulcers. However, IV PPI has a more rapid increase in pH, reaching mean pH of 6 approximately 1 h sooner than oral PPI.

## H. pylori-Induced Peptic Ulceration

### Pathophysiology

- *H. pylori*: Gram-negative flagellated rod that resides on but does not invade the gastric mucosa
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- mucosal defenses moderated by PGE2 and blood flow, mucus, etc.
- theories of how *H. pylori* causes ulcers: none satisfactory, but pattern of colonization correlates with outcome
  - gastritis only in antrum (15% of patients), high gastric acid, associated with peptic ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
  - gastritis throughout stomach ("pangastritis" – 85% of patients), low gastric acid, associated with cancer

### Epidemiology

- *H. pylori* is found in about 20% of all Canadians
  - highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

### Outcome

- gastritis (non-erosive) in 100% of patients but asymptomatic
- peptic ulcer in 15% of patients
- gastric malignancy [gastric carcinoma and mucosal associated lymphomatous tissue (MALT) lymphoma in 0.5% of patients]
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children <5 yr of age)

## Investigations

**Table 7. Diagnosis of *H. pylori* Infection**

Test	Sensitivity	Specificity	Comments
<b>Non-invasive Tests</b>			
Urea breath test	90-100%	89-100%	Affected by PPI therapy (false negatives)
Serology	88-99%	89-95%	Can remain positive after treatment
Stool antigen test	95-97%	94-98%	Useful for diagnosing acute infection
<b>Invasive Tests</b> (require endoscopy)			
Histology	93-99%	95-99%	Gold standard; affected by PPI therapy (false negatives)
Rapid urease test (on biopsy)	89-98%	93-100%	Rapid
Microbiology culture	98%	95-100%	Research only

### Treatment: *H. pylori* Eradication

- triple therapy for 7-14 d (Hp-Pac®): PPI bid (e.g. lansoprazole 30 mg bid) + amoxicillin 1 g bid + clarithromycin 500 mg bid
  - 80% success rate
- quadruple therapy for 10-14 d: PPI bid + bismuth 525 mg qid + tetracycline 500 mg qid + metronidazole 250 mg qid
  - only recommended as first line therapy if resistance to clarithromycin or metronidazole is high, or in patients with recent or repeated exposure to these drugs
  - levofloxacin can replace metronidazole or tetracycline
- sequential therapy
  - days 1-5: PPI bid + amoxicillin 1 g bid
  - days 6-10: PPI bid + clarithromycin 500 mg bid + tinidazole 500 mg bid
- 5-15% of cases are resistant to all known therapies

## NSAID-Induced Ulceration

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
  - erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically silent: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

### Pathophysiology

- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions), inhibits mucosal cyclooxygenase, leading to decreased synthesis of protective prostaglandins, thus leading to ulcers

### Risk Factors For NSAID Causing Peptic Ulcer

- previous peptic ulcers/UGIB
- age
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

### Treatment

- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

If at high risk for development of ulcers, prophylaxis with PPI indicated

**The David Y Graham Lecture: Use of Nonsteroidal Anti-inflammatory Drugs (NSAID) in a COX-2 Restricted Environment**

*Am J Gastroenterol* 2008;103:221-227

This short article reviews the current understanding of NSAID risks, emphasizing (1) with the possible exception of naproxen, all NSAIDs increase cardiovascular/cerebrovascular risk, especially the COX-2 specific inhibitors (2) low-dose Aspirin®, now used widely to decrease these risks, increases the likelihood of upper GI tract bleeding and may not abrogate the cardiovascular risk of NSAIDs (3) clopidogrel is no safer than Aspirin® in patients with high risk of upper GI tract bleeding (4) add a PPI to NSAID if there is an increased risk of upper GI events.

## Stress-Induced Ulceration

### Definition

- ulceration or erosion in the upper GI tract of ill patients, usually in ICU
- lesions most commonly in fundus of stomach

### Pathophysiology

- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing ulcers
- physiological stress (e.g. fever, severe illness, complex post-op course) causes ulcers and erosions

**Risk Factors**

- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

**Clinical Features**

- UGIB (see *Upper Gastrointestinal Bleeding*, G25)
- painless

**Treatment**

- prophylaxis with gastric acid suppressants ( $H_2$ -blockers or PPI) decreases risk of UGIB, but may increase risk of pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

**Gastric Carcinoma**

- see *General Surgery*, GS18

**Small and Large Bowel****Classification of Diarrhea****Definition**

- clinically: diarrhea defined as stools that are looser and/or more frequent than normal; physiologically: 24 h stool weight >200 g (less useful clinically)

**Classification**

- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) versus large volume (>1/2 cup stool; typical of small bowel diseases)
- watery (bowel disease) vs. steatorrhea
- secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)

**Acute Diarrhea****Definition**

- passage of frequent unformed stools for <14 d

**Etiology**

- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

**Risk Factors**

- food (seafood, chicken, turkey, eggs, beef)
- medications: antibiotics, laxatives
- others: high risk sexual activity, infectious outbreaks, family history (IBD)

**Classification**

- broadly divided and classified into inflammatory and non-inflammatory diarrhea
- mechanisms:
  - stimulation of intestinal water secretion and inhibition of water absorption (i.e. secretory problem)
  - in inflammatory diarrhea, organisms and cytotoxins invade mucosa, killing mucosal cells, further perpetuating the diarrhea

**Table 8. Classification of Acute Diarrhea**

	Inflammatory	Non-Inflammatory
<b>Definition</b>	Disruption of intestinal mucosa	Intestinal mucosa intact
<b>Site</b>	Usually colon	Usually small intestine
<b>Sigmoidoscopy</b>	Usually abnormal mucosa seen	Usually normal
<b>Symptoms</b>	Bloody (not always) Small volume, high frequency Often lower abdominal cramping with urgency $\pm$ tenesmus May have fever $\pm$ shock	Watery, little or no blood Large volume Upper/periumbilical pain/cramp $\pm$ shock
<b>Investigations</b>	Fecal WBC and RBC positive	Fecal WBC negative

**Useful Questions in Acute Diarrhea****Those Fads Wilt**

Travel  
Homosexual contacts  
Outbreaks  
Seafood  
Extra-intestinal signs of IBD  
Family history  
Antibiotics  
Diet  
Steatorrhea  
Weight loss  
Immunosuppressed  
Laxatives  
Tumour history

**Infectious Causes of Inflammatory Diarrhea****"Your Stool Smells Extremely Crappy"**

*Yersinia*  
*Shigella*  
*Salmonella*  
*E. coli* (EHEC 0157:H7), *E. histolytica*  
*Campylobacter*, *C. difficile*

**Table 8. Classification of Acute Diarrhea** (continued)

	Inflammatory	Non-Inflammatory
<b>Etiology</b>	See <i>Differential Diagnosis of Common Presenting Complaints, G4</i>	See <i>Differential Diagnosis of Common Presenting Complaints, G4</i>
<b>Differential Diagnosis</b>	Acute presentation of idiopathic inflammatory bowel disease	Acute presentation of non-inflammatory chronic diarrhea (e.g. celiac disease)
<b>Significance</b>	Higher yield with stool C&S Can progress to life-threatening megacolon, perforation, hemorrhage Antibiotics may benefit	Lower yield with stool C&S Chief life-threatening problem is electrolyte disturbances/ fluid depletion Antibiotics unlikely to be helpful

**Investigations**

- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (day care worker, nursing home resident, etc.)
  - C&S only tests *Campylobacter*, *Salmonella*, *Shigella*, *E. Coli*
    - ♦ other organisms must be ordered separately
- flexible sigmoidoscopy: useful if inflammatory diarrhea suspected
  - biopsies are the most useful method of distinguishing idiopathic IBD (Crohn's disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
- *C. difficile* toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home or recent chemotherapy

**Treatment**

- fluid and electrolyte replacement orally in most cases, intravenous if severe extremes of age/coma
- anti-diarrheals
  - antimitility agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
    - ♦ side effects: abdominal cramps, toxic megacolon
  - absorbants: kaolin/pectin (Kaopectate®), methylcellulose, activated attapulgite
    - ♦ act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
    - ♦ much less effective than antimitility agents
  - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful
- antibiotics: rarely indicated
  - risks
    - ♦ prolonged excretion of enteric pathogen (especially *Salmonella*)
    - ♦ drug side effects (including *C. difficile* infection)
    - ♦ development of resistant strains
    - ♦ renal failure/hemolysis (enterohemorrhagic *E. Coli* O157:H7)
  - indications for antimicrobial agents in acute diarrhea:
    - ♦ septicemia
    - ♦ prolonged fever with fecal blood or leukocytes
    - ♦ clearly indicated: *Shigella*, *V. cholerae*, *C. difficile*, traveller's diarrhea [enterotoxigenic *E. coli* (ETEC)], *Giardia*, *Entamoeba histolytica*, *Cyclospora*
    - ♦ situational: *Salmonella*, *Campylobacter*, *Yersinia*, non-enterotoxigenic *E. coli*
    - ♦ *Salmonella*: always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

**Stool Osmotic Gap**

Stool osmolality is normally about 290 mOsm/kg and can be approximated by the calculated stool osmolality ( $2 \times [\text{Na}^+]_{\text{stool}} + [\text{K}^+]_{\text{stool}}$ ). In osmotic diarrhea, measured stool osmolality > calculated stool osmolality. In secretory diarrhea measured stool osmolality = calculated stool osmolality.

*S. typhi* has a rose spot rash (transient maculopapular rash on anterior thorax, upper abdomen), and a prodrome of high fever, bradycardia, headache and abdominal pain. Diarrhea is not the initial presentation.

## Traveller's Diarrhea

- see [Infectious Diseases, ID14](#)

## Chronic Diarrhea

**Definition**

- passage of frequent unformed stool for >14 d
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

**Etiology/Classification**

- see *Differential Diagnosis of Common Presenting Complaints, G4*

**Investigations**

- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (anti-tTG, protein electrophoresis, IgA)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (last resort – very costly)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

## Maldigestion and Malabsorption

### Definition

- **maldigestion:** inability to break down large molecules in the lumen of the intestine into their component small molecules
- **malabsorption:** inability to transport molecules across the intestinal mucosa into circulation
- **malassimilation:** encompasses both maldigestion and malabsorption

### Etiology

- **maldigestion**
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis, pancreatitis, cancer)
  - bile salt deficiency
    - ♦ terminal ileal disease (impaired recycling), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic)
  - specific enzyme deficiencies (e.g. lactase)
- **malabsorption**
  - inadequate absorptive surface
    - ♦ infections/infestations (e.g. Whipple's disease, Giardia)
    - ♦ immunologic or allergic injury (e.g. celiac disease)
    - ♦ infiltration (e.g. lymphoma, amyloidosis)
    - ♦ fibrosis (e.g. systemic sclerosis, radiation enteritis)
    - ♦ bowel resection
    - ♦ extensive Crohn's disease
  - drug-induced
    - ♦ cholestyramine, ethanol, neomycin, tetracycline and other antibiotics
  - endocrine
    - ♦ diabetes (complex pathogenesis)

### Clinical Features

- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency (see Table 9)

Fat Soluble Vitamins: **ADEK**  
vitamin A, vitamin D, vitamin E, vitamin K

**Table 9. Absorption of Nutrients and Fat Soluble Vitamins**

Deficiency	Absorption	Signs and Symptoms	Investigations
<b>Iron</b>	Duodenum, upper jejunum	Hypochromic, microcytic anemia, glossitis, koilonychia (spoon nails), pica	↓ Hb, ↓ serum Fe, ↓ serum ferritin
<b>Calcium</b>	Duodenum, upper jejunum (binds to $\text{Ca}^{2+}$ binding-protein in cells; levels increased by Vit D)	Metabolic bone disease, may get tetany and paresthesias if serum calcium falls (see <a href="#">Endocrinology</a> , E40)	↓ serum $\text{Ca}^{2+}$ , ↓ serum $\text{Mg}^{2+}$ , and ↑ ALP Evaluate for ↓ bone mineralization radiographically (DEXA)
<b>Folic acid</b>	Jejunum	Megaloblastic anemia, glossitis, ↓ red cell folate (may see ↑ folic acid with bacterial overgrowth)	↓ serum folic acid
<b>Vitamin B<sub>12</sub></b>	B <sub>12</sub> ingested and bound to R proteins mainly from salivary glands; stomach secretes intrinsic factor (IF) in acidic medium; in basic medium, proteases from the pancreas cleave R protein and B <sub>12</sub> -IF complex forms, protecting B <sub>12</sub> from further protease attack; B <sub>12</sub> absorbed in ileum and binds to transcobalamin (TC)	Subacute combined degeneration of the spinal cord, peripheral/optic neuropathy, dementia, megaloblastic anemia, glossitis	Differentiate causes by Schilling test when available Positive anti-intrinsic factor antibodies and atrophic gastritis point toward pernicious anemia (see <a href="#">Hematology</a> , H22)
<b>Carbohydrate</b>	Complex polysaccharides hydrolyzed to oligosaccharides and disaccharides by salivary and pancreatic enzymes Monosaccharides absorbed in duodenum/jejunum	Generalized malnutrition, weight loss, flatus and diarrhea	Hydrogen breath test Trial of carbohydrate-restricted diet D-xylose test
<b>Protein</b>	Digestion at stomach, brush border, and inside cell Absorption occurs primarily in the jejunum	General malnutrition and weight loss, amenorrhea and ↓ libido if severe	↓ serum albumin (low sensitivity)
<b>Fat</b>	Lipase, colipase, phospholipase A (pancreatic enzymes) and bile salts needed for digestion Products of lipolysis form micelles which solubilize fat and aid in absorption Fatty acids diffuse into cell cytoplasm	Generalized malnutrition, weight loss and diarrhea Foul-smelling feces + gas Steatorrhea	Small bowel biopsy MRCP, ERCP, pancreatic function tests Quantitative stool fat test (72 h) (Sudan stain of stool) (C-triolein breath test)
<b>Vitamin A</b>	Dietary sources (e.g. milk, eggs, liver, carrots, sweet potatoes)	Night blindness Dry skin Keratomalacia	
<b>Vitamin D</b>	Skin (via UV light) or diet (e.g. eggs, fish oil, fortified milk)	Osteomalacia in adults Rickets in children	
<b>Vitamin E</b>	Dietary sources (e.g. vegetable oils, nuts, leafy green vegetables)	Retinopathy, neurological problems	
<b>Vitamin K</b>	Synthesized by intestinal flora ↑ risk of deficiency after prolonged use of broad spectrum antibiotics and/or starvation	Prolonged INR causes bleeding	

\* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone

## Investigations

- transglutaminase serology/protein electrophoresis and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea
- serum carotene, folate,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ , vitamin  $\text{B}_{12}$ , albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (rarely used)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)
- trial of therapy with pancreatic enzymes

## Treatment

- dependent on underlying etiology

# Celiac Disease (Gluten Enteropathy/Sprue)

## Definition

- abnormal small intestine mucosa due to intestinal reaction to gliadin, a component of gluten found in cereal grains

## Etiology

- only autoimmune disease in which antigen ( $\alpha$ -gliadin) is recognized
- associated with other autoimmune diseases, especially thyroid disease
- gluten, a protein in cereal grains, broken down to gliadin, is toxic factor
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; also associated with HLA-DQ8

## Epidemiology

- more common in women
- family history: 15% of first-degree relatives
- may present any time from infancy (when cereals introduced) to elderly
- peak presentation in infancy

## Clinical Features

- classically: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; now more commonly bloating, gas, iron deficiency
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
  - thus iron, calcium and folic acid deficiency more common than vitamin  $\text{B}_{12}$  deficiency
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

## Investigations

- small bowel mucosal biopsy (usually duodenum) is diagnostic with:
  - villous atrophy and crypt hyperplasia
  - increased number of plasma cells and lymphocytes in lamina propria
  - increased intraepithelial lymphocytes
  - villous atrophy also seen in small bowel overgrowth, Crohn's, lymphoma, Giardia, HIV
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation,  $\text{Ca}^{2+}$ , Fe, albumin, cholesterol, carotene,  $\text{B}_{12}$  absorption
- improvement with a gluten-free diet; should not be started before anti-tTG and biopsy
- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - IgA deficient patients have false-negative anti-tTG
    - thus measure serum IgA concomitantly (via serum protein electrophoresis)
- fecal fat >7%

## Treatment

- dietary counselling
  - gluten free diet: avoid barley, rye, wheat
    - oats allowed if not contaminated by other grains
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
- if poor response to diet change, consider:
  - alternate diagnosis
  - non-adherence to gluten-free diet
  - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)

### Gluten found in "BROW"

Barley  
Rye  
Oats (controversial)  
Wheat

### Gluten Microchallenge with Wheat-based Starch Hydrolysates in Celiac Disease Patients

*Aliment Pharm Therap* 2008;28:1240-1248

**Study:** Randomized, placebo-controlled, prospective study with 24 wk follow-up.

**Participants:** 90 patients with celiac disease in remission.

**Intervention:** Patients either received glucose syrups, maltodextrins or placebo.

**Primary Outcome:** Small bowel mucosal morphology and inflammation, symptoms, celiac serology and malabsorption.

**Results:** There were no significant differences between the intervention and control group in small-bowel morphology and inflammation, gastrointestinal symptoms, serology or malabsorption parameters.

**Conclusion:** Celiac patients can safely continue to consume wheat-based starch hydrolysates, glucose syrups and maltodextrins.

- development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
- development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

### Prognosis

- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon)
- risk of malignancy may be lowered by dietary gluten restriction

## Inflammatory Bowel Disease (IBD)

### Definition

- Crohn's disease, ulcerative colitis, indeterminate colitis

### Pathophysiology

- poorly understood
- sustained response of the immune system, perhaps to enteric flora in a genetically predisposed individual
- current hypothesis: lack of appropriate down-regulation of immune responsiveness

### Genetics

- increased risk of both UC and CD in relatives of patients with either disease, especially siblings, early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 9 gene loci described to be associated
- CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially Ashkenazi Jews, early onset disease, ileal involvement, fistulizing and stenotic disease
  - CARD15 gene product modulates NFκB, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

### Clinical Features

**Table 10. Clinical Differentiation of Ulcerative Colitis from Crohn's Disease**

	Crohn's Disease	Ulcerative Colitis
<b>Location</b>	Any part of GI tract <ul style="list-style-type: none"> <li>• Small bowel + colon: 50%</li> <li>• Small bowel only: 30%</li> <li>• Colon only: 20%</li> </ul>	Isolated to large bowel Always involves rectum, may progress proximally
<b>Rectal Bleeding</b>	Uncommon	Very common (90%)
<b>Diarrhea</b>	Less prevalent	Frequent small stools
<b>Abdominal Pain</b>	Post-prandial/colicky	Less common
<b>Fever</b>	Common	Uncommon
<b>Urgency/Tenesmus</b>	Uncommon (unless rectum involved)	Common
<b>Palpable Mass</b>	Frequent (25%), RLQ	Rare (if present, cecum full of stool)
<b>Recurrence After Surgery</b>	Common	None post-colectomy
<b>Endoscopic Features</b>	Ulcers (aphthous, stellate, linear), patchy lesions, pseudopolyps, cobblestoning	Continuous diffuse inflammation, erythema, friability, loss of normal vascular pattern, pseudopolyps
<b>Histologic Features</b>	Transmural distribution with skip lesions Focal inflammation ± noncaseating granulomas, deep fissuring + aphthous ulcerations, strictures Glands intact	Mucosal distribution, continuous disease (no skip lesions) Granulomas absent Gland destruction, crypt abscess
<b>Radiologic Features</b>	Cobblestone mucosa Frequent strictures and fistulae AXR: Bowel wall thickening "string sign"	Lack of haustra Strictures rare and suggests complicating cancer
<b>Complications</b>	Strictures, fistulae, perianal disease	Toxic megacolon
<b>Colon Cancer Risk</b>	Increased if >30% of colon involved	Increased except in proctitis

**Table 11. Extraintestinal Manifestations (EIM) of IBD**

System	Crohn's Disease	Ulcerative Colitis
<b>Dermatologic</b>		
Erythema Nodosum	15%	10%
Pyoderma Gangrenosum	10%	Less common
Perianal skin tags	75-80%	Rare
Oral mucosal lesions	Common	Rare
Psoriasis	Statistically associated in 5-10% of those with IBD but not an EIM	
<b>Rheumatologic</b>		
Peripheral arthritis	15-20% of those with IBD (CD>UC)	
Ankylosing Spondylitis	10% of those with IBD (CD>UC)	
Sacroiliitis	Occurs equally in CD and UC	
<b>Ocular</b> (~10% of IBD)		
Uveitis (vision threatening)		
Episcleritis (benign)	3-4% of IBD patients (CD>UC)	
<b>Hepatobiliary</b>		
Cholelithiasis	15-35% of patients with ileal Crohn's	
Primary sclerosing cholangitis (PSC)	1-5% of IBD cases involving colon	
Fatty liver		
<b>Urologic</b>		
Calculi	Most common in CD, especially following ileal resection	
Ureteric obstruction		
Fistulae	Characteristic of Crohn's	
<b>Others</b>		
Thromboembolism		
Vasculitis		
Osteoporosis		
Vitamin deficiencies (B <sub>12</sub> , Vit ADEK)		
Cardiopulmonary disorders		
Pancreatitis (rare)		

## Crohn's Disease (CD)

### Definition

- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region ("gum to bum")

### Epidemiology

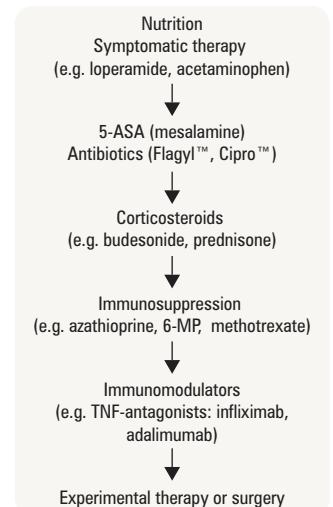

- incidence 1-6/100,000; prevalence 10-100/100,000
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn's increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in Crohn's patients is higher than general population

### Clinical Features

- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, diarrhea and weight loss
- most common location: ileum + ascending colon
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- fistulae, fissures, abscesses are common
- extra-intestinal manifestations (see Table 11) are more common with colonic involvement
- linear ulcers leading to mucosal islands and "cobblestone" appearance
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina and other parts of bowel
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

### Investigations

- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response
- bacterial cultures, O&P, *C. difficile* toxin to exclude other causes of inflammatory diarrhea

**Figure 7. Traditional graded approach to induction therapy in Crohn's disease**

Note: Starting with immunosuppressives plus immunomodulators ("bottom-up approach") increasingly being used (Lancet 2008;371:660-667). Combination of azathioprine and infliximab has the highest remission rate yet described with medical treatment (NEJM 2010;362:1383-1395).

Characteristically more than 1 yr between onset of symptoms and diagnosis of Crohn's disease.

**Management** (also see Figure 7)**Table 12. Management of Crohn's Disease**

Management	Notes
<b>Lifestyle/Diet</b>	Smoking cessation Fluids only during acute exacerbation Enteral diets may aid in remission No evidence for any non-enteral diet changing the natural history of Crohn's disease, but may affect symptoms Those with extensive small bowel involvement or extensive resection require electrolyte, mineral and vitamin supplements (vit D, $\text{Ca}^{2+}$ , $\text{Mg}^{2+}$ , zinc, Fe, $\text{B}_{12}$ )
<b>Antidiarrheal Agents*</b>	Loperamide (Imodium®) > diphenoxylate (Lomotil®) > codeine (cheap but addictive) All work by decreasing small bowel motility Caution if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups
<b>5-ASA</b>	Efficacy controversial: most evidence for mild colonic disease Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine Hydrolysis by intestinal bacteria releases 5-ASA (active component) Dose-dependent efficacy Mesalamine (Pentasa®): coated 5-ASA releases 5-ASA in the ileum and colon
<b>Antibiotics</b>	e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin Best described for perianal Crohn's, although characteristically relapse when discontinued
<b>Corticosteroids</b>	Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis
<b>Immunosuppressives</b>	6-mercaptopurine (6-MP), azathioprine (Imuran®); methotrexate (used less often) More often used to maintain remission than to treat active inflammation Most commonly used as steroid-sparing agents i.e. to lower risk of relapse as corticosteroids are withdrawn May require >3 mo to have beneficial effect; usually continued for several years May help to heal fistulae, decrease disease activity Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy
<b>Biologics</b>	Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF- $\alpha$ Proven effective for treatment of fistulae and patients with medically refractory CD First-line immunosuppressive therapy with infliximab + azathioprine more effective than using either alone
<b>Surgical/Experimental</b>	Surgical treatment (see <a href="#">General Surgery</a> , GS30) Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding and for medically refractory disease If <50% or <200 cm of functional small intestine, risk of short bowel syndrome At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher 40% likelihood of second bowel resection, 30% likelihood of third bowel resection Complications of ileal resection: <100 cm resected → watery diarrhea (impaired bile salt absorption) Treatment: cholestyramine or anti-diarrheals e.g. loperamide >100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency) Treatment: fat restriction, medium chain triglycerides

\*Cholestyramine: a bile-salt binding resin; for watery diarrhea with <100 cm of terminal ileum diseased or resected; however, non-specific anti-diarrheals are more convenient and often more potent

**Traditional Medical Management of Crohn's**

	Induction of Remission	Maintenance
5-ASA	?	?
Steroids	+	
Immunosuppressive	+	+
Antibiotics	+	
MTX	+	+
Infliximab	+	+

**Biological Therapies for Inflammatory Bowel Diseases**

*Gastroenterology* 2009;136:1182-1197

Although the etiology of inflammatory bowel diseases (IBD) is unknown, biological therapies (BT) that target key molecules in innate and adaptive immune pathways have been designed.

**Anti-TNF Agents** (infliximab, adalimumab, certolizumab): Effective in CD, less effective for UC. Increase mucosal healing, decrease need for hospitalizations and surgeries, and can induce steroid-free remission. At least 10% of patients annually develop intolerance and/or a loss of response.

**Selective Anti-Adhesion Molecules** (natalizumab): Increases response and remission rates, circulating leukocytes and steroid-sparing capacity in CD. Progressive multifocal leukoencephalopathy is a rare adverse event.

**Promising New BT:** Anti-Interleukin-12/Interleukin-23 p40 target factors more often associated with CD, while anti-IFN-antibodies may treat CD and UC.

**BT Without Established Efficacy:** Recombinant human cytokines, blockade of T-cell activation (daclizumab and basiliximab) and stimulators of the innate immune system.

**Conclusion:** Anti-TNF agents are effective treatments for IBD. There is a need to develop salvage biologic therapies for patients who do not respond to a first biological drug. BT's have a safety risk, so their place in treatment algorithms must be defined carefully.

**Prognosis**

- highly variable course
- 10% disabled by the disease eventually; spontaneous remission also described
- increased mortality, especially with more proximal disease; greatest in the first 4-5 yr
- complications include:
  - intestinal obstruction/perforation
  - fistula formation
  - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as ulcerative colitis (see below) if more than 1/3 of colon involved

## Ulcerative Colitis (UC)

### Definition

- inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

### Epidemiology

- incidence 2-10/100,000; prevalence 35-100/100,000 (more common than Crohn's)
- 2/3 onset by age 30 (with second peak after 50); M=F
- small hereditary contribution (15% of cases have 1st degree relative with disease)
- risk is less in smokers
- inflammation limited to rectum or left colon is more common than pancolitis

### Pathology

- disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
- inflammation seen is diffuse, continuous and confined to mucosa

### Clinical Features

- rectal bleeding is the hallmark feature, however diarrhea may be present if more than the rectum is involved
  - can also have abdominal cramps/pain, especially with defecation
- severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
- tenesmus, urgency, incontinence
- systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
- extra-intestinal manifestations (see Table 11)
- characteristic exacerbations and remissions; 5% of cases are fulminant

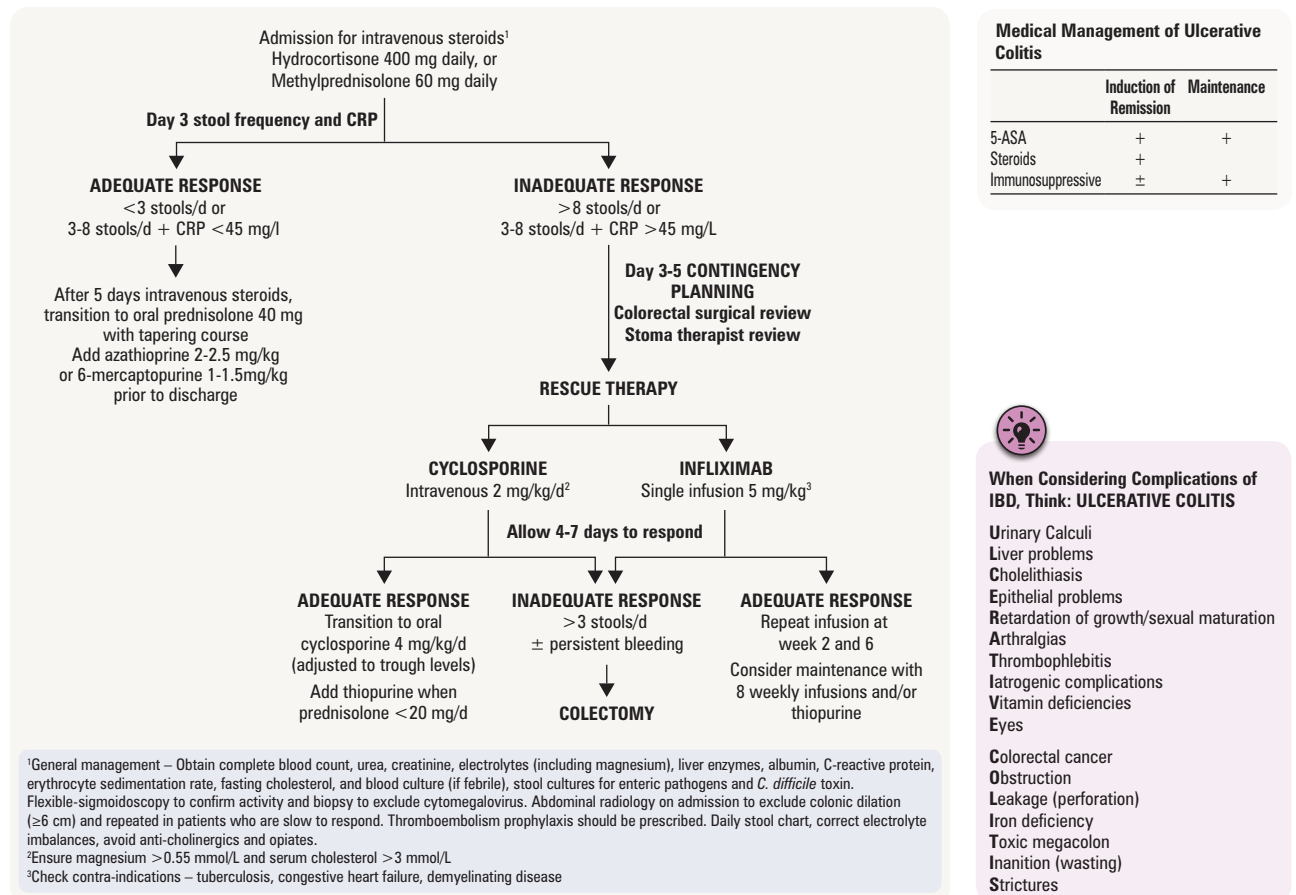

In UC, non-bloody diarrhea is frequently the initial presentation; eventually progressing to bloody diarrhea.

### Investigations

- sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
- colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
- stool culture, microscopy, *C. difficile* toxin assay necessary to exclude infection
- no single confirmatory test

### Management

- mainstays of treatment: 5-ASA (mesalamine) derivatives and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
- diet of little value in decreasing inflammation but may alleviate symptoms
- antidiarrheal medications generally not indicated in UC
- 5-ASA
  - topical (suppository or enema): very effective for distal disease (distal to splenic flexure), preferable to corticosteroids
  - oral: effective for mild to moderate, but not severe colitis (4 g/d)
  - e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d
  - commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
  - may decrease rate of colorectal cancer
- corticosteroids
  - to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h)
  - limited role as maintenance therapy
  - use suppositories for proctitis, enemas for proctosigmoiditis
  - topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
- immunosuppressants (steroid-sparing)
  - if severe UC is refractory to steroid therapy, consider adding IV cyclosporine or IV infliximab within 3-5 d of recognition of need for salvage – rapidly effective, but helpful only in a minority of patients
  - azathioprine: too slow to rapidly resolve acute relapse
    - most commonly used to induce and maintain remission as corticosteroids withdrawn
- surgical treatment
  - early in severe UC, especially fulminant cases and toxic megacolon – consider operation if no response after 3-5 d of corticosteroids, or after 4-7 d of immunosuppressive medical therapy
  - aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis
  - indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids

<sup>1</sup>General management – Obtain complete blood count, urea, creatinine, electrolytes (including magnesium), liver enzymes, albumin, C-reactive protein, erythrocyte sedimentation rate, fasting cholesterol, and blood culture (if febrile), stool cultures for enteric pathogens and *C. difficile* toxin. Flexible-sigmoidoscopy to confirm activity and biopsy to exclude cytomegalovirus. Abdominal radiology on admission to exclude colonic dilation (≥6 cm) and repeated in patients who are slow to respond. Thromboembolism prophylaxis should be prescribed. Daily stool chart, correct electrolyte imbalances, avoid anti-cholinergics and opiates.

<sup>2</sup>Ensure magnesium >0.55 mmol/L and serum cholesterol >3 mmol/L

<sup>3</sup>Check contra-indications – tuberculosis, congestive heart failure, demyelinating disease

**Medical Management of Ulcerative Colitis**

	Induction of Remission	Maintenance
5-ASA	+	+
Steroids	+	
Immunosuppressive	±	+

**When Considering Complications of IBD, Think: ULCERATIVE COLITIS**

Urinary Calculi  
Liver problems  
Cholelithiasis  
Epithelial problems  
Retardation of growth/sexual maturation  
Arthralgias  
Thrombophlebitis  
Iatrogenic complications  
Vitamin deficiencies  
Eyes

Colorectal cancer  
Obstruction  
Leakage (perforation)  
Iron deficiency  
Toxic megacolon  
Inanition (wasting)  
Strictures

**Figure 8. Medical management of severe ulcerative colitis**

Gastroenterology 2011;140:1827-1837

## Complications

- similar to CD, except:
  - more liver problems (especially primary sclerosing cholangitis in men)
  - greater risk of colorectal cancer
    - ♦ risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
    - ♦ risk also increases with active mucosal inflammation and sclerosing cholangitis
    - ♦ thus, regular colonoscopy and biopsy in pancolitis of ≥8 yr is indicated
  - toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see [General Surgery](#), GS26)

## Prognosis

- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- >1 attack in almost all patients
- more colonic involvement in the 1st year correlates with increased severity of attacks and increased colectomy rate
  - colectomy rate = 1% for all patients after the 1st year; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course

## Irritable Bowel Syndrome (IBS)

### Definition

- a form of functional bowel disease, more than just a label for GI symptoms unexplained after investigations

### Epidemiology

- 20% of North Americans
- onset of symptoms usually in young adulthood
- F>M

### Pathophysiology

- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associations or if causative
- psychological: stress may increase IBS symptoms but does not cause IBS

### Diagnosis

**Table 13. Rome III Criteria for Diagnosing Irritable Bowel Syndrome**

#### IBS Rome III Criteria

- $\geq 12$  wk in the past 12 mo of abdominal discomfort or pain that has 2 out of 3 features:
  - Relieved with defecation
  - Associated with a change in frequency of stool
  - Associated with a change in consistency of stool
- The following are supportive, but not essential to the diagnosis:
  - Abnormal stool frequency ( $>3/d$  or  $<3/wk$ )
  - Abnormal stool form (lumpy/hard/loose/watery)  $>1/4$  of defecations
  - Abnormal stool passage (straining, urgency, feeling of incomplete evacuation)  $>1/4$  of defecations
  - Passage of mucus  $>1/4$  of defecations
  - Bloating

#### Diagnosis of IBS Less Likely in Presence of "Red Flag" Features

- Weight loss
- Fever
- Nocturnal defecation
- Anemia
- Blood or pus in stool
- Abnormal gross findings on flexible sigmoidoscopy

#### Normal Physical Exam

### Investigations

- if history consistent with Rome III criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS
- CBC, TSH, albumin, CRP, tTG serology with protein electrophoresis
- stool for C&S, O&P, fat excretion if diarrhea present
- consider sigmoidoscopy

### Management

- reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction
- no therapeutic agent consistently effective, pain most difficult to control
- symptom-guided treatment
  - pain predominant
    - ♦ antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine)
    - ♦ increase dietary fibre (bran or psyllium)
    - ♦ tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI)
  - diarrhea predominant
    - ♦ increase dietary fibre (bran or psyllium) to increase stool consistency
    - ♦ loperamide (Imodium®)
    - ♦ diphenoxylate (Lomotil®)
    - ♦ cholestyramine 4 g QID
  - constipation predominant
    - ♦ exercise and increase fibre in diet
    - ♦ osmotic or other laxatives

### Prognosis

- 80% improve over time
- most have intermittent episodes
- normal life expectancy

#### IBS Mimickers

- Enteric infections e.g. *Giardia*
- Lactose intolerance/other disaccharidase deficiency
- Crohn's disease
- Celiac sprue
- Drug-induced diarrhea
- Diet-induced (excess tea, coffee, colas)

## Constipation

### Definition

- passage of infrequent or hard stools with straining (stool water  $<50$  mL/d); bowel frequency  $<3$  times/wk

### Epidemiology

- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

## Etiology

- most common: idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes
  - medication side effects (narcotics, antidepressants) are the most common
  - intestinal obstruction, left sided colon cancer (consider in older patients) and fecal impaction
  - metabolic
    - ♦ diabetes mellitus
    - ♦ hypothyroidism
    - ♦ hypercalcemia, hypokalemia, uremia
  - neurological
    - ♦ intestinal pseudo-obstruction
    - ♦ Parkinson's disease
    - ♦ multiple sclerosis
  - collagen vascular disease (e.g. scleroderma)
  - painful anal conditions (e.g. fissures)

## Clinical Presentation

- overlaps with irritable bowel syndrome
- abdominal pain relieved by defecation, hard stools, straining and pain with defecation, flatulence, overflow diarrhea, tenesmus (sense of incomplete evacuation), abdominal distention, <3 BM/wk

## Investigations

- consider colon visualization (colonoscopy, CT colonography), although chronic constipation by itself is rarely due to colonic mucosal disease
- classification based on colon transit time, can be quantitated by swallowing radio-opaque markers to measure colonic transit time (normal: 70 h)
  - (1) normal = misperception of normal defecation (irritable bowel syndrome)
  - (2) prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  - (3) outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of (2) and (3) common

## Treatment (in order of increasing potency)

- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
  - docusate salts, mineral oils
- osmotic agents (effective in 2-3 d)
  - lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, aka milk of magnesia), lactitol, polyethylene glycol 3350
- cathartics/stimulants (effective in 24 h)
  - castor oil, senna (avoid prolonged use to prevent melanosis coli), bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)

### Causes of Constipation

#### DOPED

Drugs

Obstruction

Pain

Endocrine dysfunction

Depression

## Upper Gastrointestinal Bleeding

### Definition

- bleeding proximal to the ligament of Treitz (75% of GI bleeds)
  - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

### Etiology

- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (see *Peptic Ulcer Disease*, G12)
  - gastritis (e.g. from alcohol or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and CTD)
  - dieulafoy lesion (very rare)

**Aortoenteric Fistula** is a rare and lethal cause of GI bleed, most common in patients with a history of aortic graft surgery. Therefore, perform emergency endoscopy if suspected, emergency surgery if diagnosed.

**Note:** The window of opportunity is narrow. Suspect if history of aortic graft, abdominal pain associated with bleeding.

- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy's lesion, AVM)

### Clinical Features

- in order of decreasing severity of the bleed: hematochezia > hematemesis > coffee ground emesis > melena > occult blood in stool

### Management (initial)

- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider NG tube to determine upper vs. lower GI bleeding in some cases
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclips
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50 µg loading dose followed by constant infusion of 50 µg/h
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach

### Prognosis

- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding: spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no predictors of rebleeding
- H<sub>2</sub>-antagonists have little impact on rebleeding rates and need for surgery
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)

Always ask about NSAID/Aspirin® or anticoagulant therapy in GI bleed.

### Forrest Classification of Bleeding Peptic Ulcers

Forrest Class	Type of lesion	Risk of Rebleed (%)
I	Arterial bleeding (oozing/spurting)	55-100
Ila	Visible vessel	43
Ilb	Sentinel clot	22
Ilc	Hematin covered flat spot	10
III	No stigmata of hemorrhage	5

Lancet 1974;2:394-397

### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

NEJM 2013;368:11-21

**Study:** Prospective, unblinded, RCT, follow-up up to 45 d.

**Populations:** 921 patients with hematemesis, bloody nasogastric aspirate, melena or both. Exclusion criteria included massive bleed, ACS, stroke/TIA or transfusion within previous 90 d; recent trauma/surgery; lower GI bleed.

**Intervention:** Patients randomized to restrictive (<70 g/L) or liberal (<90 g/L) transfusion.

**Outcome:** Mortality, further bleeding, adverse events.

**Results:** Fewer patients in the restrictive group required transfusion (51% vs. 15%;  $P < 0.001$ ). The hazard ratio for death for restrictive compared to liberal transfusion was 0.55; 95% CI, 0.33 to 0.92;  $P = 0.02$ . Further bleeding occurred in 10% vs. 16% ( $P = 0.01$ ) of patients, while adverse effects occurred in 40% vs. 48% ( $P = 0.02$ ) of patients in the restrictive and liberal strategies, respectively. The restrictive strategy had a better survival rate in patients with bleeding associated with cirrhosis Child-Pugh class A or B (HR: 0.30; 95% CI, 0.11 to 0.85), but not in cirrhosis Child-Pugh class C (HR: 1.04; 95% CI, 0.45 to 2.37) or a peptic ulcer (HR: 0.70; 95% CI, 0.26 to 1.25).

**Conclusions:** Transfusing patients with an acute upper GI bleed at hemoglobin of <70 g/L rather than 90 g/L is associated with fewer transfusions, better survival, and fewer adverse events.

### Review Article: Improved Survival with Patients with Variceal Bleeds

Int J Hepatol 2011;doi=10.461/2011/356919

**General measures:** Resuscitation to achieve hemodynamic stability (Hb >70-80 g/L) but avoid fluid overload as it can precipitate or worsen ascites.

**Antibiotic prophylaxis:** IV ceftriaxone or postendoscopic norfloxacin reduces bacterial infection, rebleeding rates, length of hospitalization, and all-cause mortality.

**Splanchnic vasoconstriction:** Somatostatin, Octreotide, Terlipressin.

**Therapeutic Endoscopy:** Band ligation is superior to injection sclerotherapy in initial control of bleeding, incidence of rebleeding, side effects, time, and survival.

Combination therapy with vasoactive drug plus endoscopic band ligation is recommended for Child's A and if combined therapy fails (HVPG >20 mmHg within 24 h after start of bleed is the best predictor failure); TIPS is then recommended for patients with Child's B or C, early TIPS is recommended over combined therapy.

## Approach to Iron Deficiency Anemia

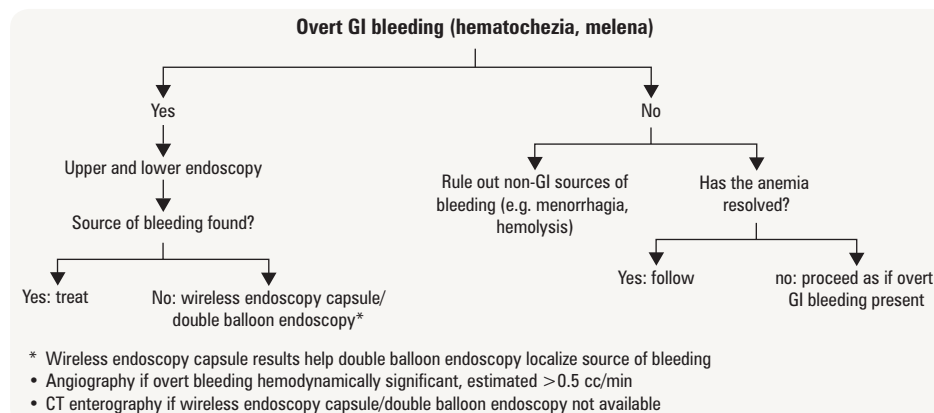

Figure 9. Approach to iron deficiency anemia

## Esophageal Varices

### Etiology

- almost always due to portal hypertension
- often accompanied by varices in stomach

### Clinical Features

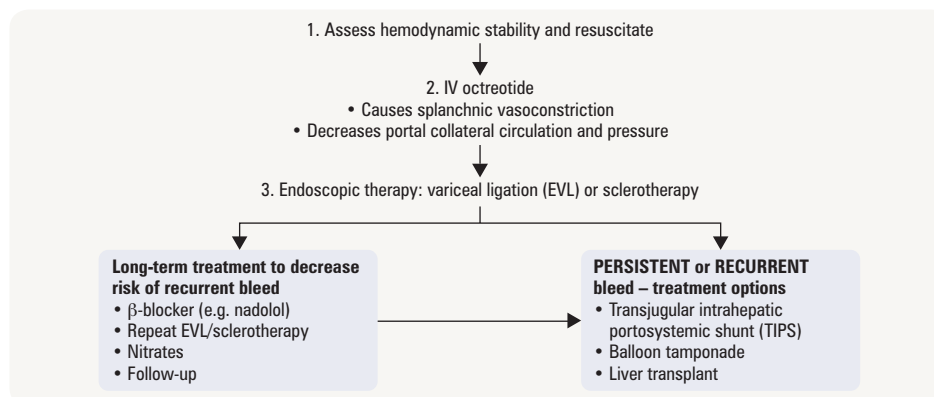

- characteristically massive upper GI bleeding

### Prognosis

- risk of bleeding: 30% in first year
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

**Investigations**

- endoscopy

**Management****Figure 10. Management of bleeding esophageal varices**

Not depicted: Intravenous ceftriaxone (lowers risk of sepsis, especially spontaneous bacterial peritonitis)

If varices isolated to stomach, think of splenic vein thrombosis.

Gastric varices best treated by endoscopic injection of cyanoacetate ("crazy glue").

In a prospective study of upper GI tract bleeding, mortality, recurrent bleeding, and adverse events were lower when transfusions were given only when the hemoglobin concentration fell below 70 g/L, compared to transfusions given when the hemoglobin fell below 90 g/L. The benefit was most marked in variceal bleeding with Childs-Pugh Class A or B cirrhosis (see below under cirrhosis), but also seen in peptic ulcer. Exclusion criteria included exsanguinating bleeding, acute coronary syndrome and stroke.

*N Engl J Med* 2013;368:11-21

## Mallory-Weiss Tear

**Definition**

- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

**Etiology**

- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present

**Clinical Features**

- hematemesis  $\pm$  melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

**Management**

- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection  $\pm$  clips or surgical repair

## Lower Gastrointestinal Bleeding

**Definition**

- bleed distal to ligament of Treitz

**Etiology**

- rule out upper GI source
- diverticular (60% from right colon)
- vascular
  - angiodysplasia
  - anorectal (hemorrhoids, fissures)
- neoplasm
  - cancer
  - polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic)
- post-polypectomy

**Clinical Features**

- hematochezia (see Figure 11)
- anemia
- occult blood in stool
- rarely melena

**Management**

- treat underlying cause

Always exclude upper GI lesion before localizing the site of the bleeding to the lower GI tract.

**Lower GI Bleed****CHAND**

Colitis [radiation, infectious, ischemic, IBD (UC > CD)]

Hemorrhoids/fissure

Angiodysplasia

Neoplastic

Diverticular disease

## Liver

## Investigations of Hepatobiliary Disease

### A. TEST OF LIVER FUNCTION

#### Prothrombin Time (PT or INR)

- a marker of hepatic protein synthesis
- increased by:
  - impaired hepatic protein synthesis (>80%) (including all coagulation factors except VIII) i.e. hepatocellular dysfunction
  - vitamin K deficiency
  - vitamin K administration promptly corrects PT in vitamin K deficiency (malnutrition, malabsorption, etc.) but not in hepatocellular dysfunction; thus in the absence of vitamin K deficiency, PT is a reliable index of hepatocellular dysfunction

#### Serum Albumin Level

- a marker of hepatic protein synthesis; must exclude malnutrition, renal or GI losses and significant inflammatory or malignant illness of any organ system

#### Serum Bilirubin

- marker of hepatic excretion: transport from hepatocyte to bile
- canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut
- direct bilirubin = conjugated; indirect = unconjugated bilirubin
- liver dysfunction causes hyperbilirubinemia (elevated direct bilirubin) since conjugation preserved even in end stage liver failure

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver.

**Serum transaminases >1000 due to**

- Viral hepatitis
- Drugs
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone

ALT > AST = most causes of hepatitis  
AST > ALT = alcoholic liver disease or other causes of hepatitis that have progressed to advanced cirrhosis

**B. TESTS OF LIVER DAMAGE**

- disproportionately increased AST or ALT = hepatocellular damage
  - ALT more specific to liver; AST from multiple sources (especially muscle)
  - elevation of both highly suggestive of liver injury
  - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP and GGT = cholestasis
  - if ALP is elevated alone, rule out bone disease by fractionating ALP
  - if ALP elevation out of proportion to ALT/AST elevation, consider:
    - obstruction of common bile duct (extraluminal = pancreatic Ca, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
    - destruction of microscopic ducts (e.g. PBC)
    - bile acid transporter defects (drugs, intrahepatic cholestasis of pregnancy)
    - infiltration of the liver (liver metastases, lymphoma, granulomas, amyloid)

**Alcoholic hepatitis:** history of recent alcohol, RUQ abdominal pain, AST/ALT > 2, AST usually < 300, low grade fever, mildly elevated WBC.

**Major Sources of ALP**

- Hepatobiliary tree
- Bone
- Placenta

**Acute Viral Hepatitis (General)****Definition**

- viral hepatitis lasting < 6 mo

**Clinical Features**

- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - nausea, vomiting, anorexia, taste/smell disturbance, headaches, fatigue, myalgia, low-grade fever
  - arthralgia and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

**Investigations**

- AST and ALT (> 10-20x normal in hepatocellular necrosis)
- ALP and bilirubin minimally elevated
- viral serology, IgM

**Treatment**

- supportive (hydration, diet)
- indications for hospitalization: encephalopathy, coagulopathy severe vomiting, hypoglycemia

**Prognosis**

- poor prognostic indicators: comorbidities, persistently high bilirubin (> 340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia
- cholestasis (most commonly with HAV infection)

**Complications**

- hepatocellular necrosis: AST, ALT > 10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

**DDx for Hepatomegaly**

- Congestive (right heart failure, Budd-Chiari syndrome)
- Infiltrative
  - Malignant (primary, secondary, lymphoproliferative, leukemia)
  - Benign (fatty liver, cysts, hemochromatosis, extramedullary hematopoiesis, amyloid)
- Proliferative
  - Infectious (viral, tuberculosis, abscess, echinococcus)
  - Inflammatory (granulomas [sarcoid], histiocytosis X)

**DDx for Hepatitis**

- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

**Causes of Elevated Serum Transaminases in Chronic Hepatitis B**

- Ongoing immune-mediated liver injury without immune control of HBV
- Reactivation from prior immune control due to lack of adequate immune control
- Seroconversion (HBeAg converting to anti-HBe; spontaneously or with Rx)
- Hepatitis D
- Liver insult (fatty liver, alcohol, drugs, hepatitis A)

**Hepatitis A Virus (HAV)**

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice
- can cause fulminant hepatic failure and subsequent death (< 1-5%)
- can relapse, but never becomes chronic

**Hepatitis B Virus (HBV)****Table 14. Hepatitis B Serology**

	HBsAg	Anti-HBs	HBeAg	Anti-HBe	Anti-HBc	Liver Enzymes
Acute HBV	+	-	+	-	IgM	
Chronic HBV (high HBV DNA)	+	-	+	-	IgG	ALT, AST elevated
Chronic HBV (low HBV DNA)	+	-	-	+	IgG	ALT, AST normal
Resolved infection	-	±	-	±	IgG	
Immunization	-	+	-	-	-	

**Figure 12. Time course of acute hepatitis B infection**

### Epidemiology

- 4 phases of chronic hepatitis B: not all will go through all 4 phases, but all will have positive HBsAg
  - immune tolerance:** extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or 'incubation period' in adult with newly-acquired HBV)
  - immune clearance** (or immunoactive): falling but still elevated HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment
  - immune control:** lower HBV-DNA (<20,000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  - immune escape** ("core or precore mutant"): elevated HBV-DNA (>2,000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

### Management

- counselling: 40% of men and 10% of women with perinatal infection will die from HBV-related complications
- prolonged immune-mediated damage leads to higher risk of liver fibrosis
- hepatocellular carcinoma screening with ultrasound q6mo, especially if high serum HBV-DNA levels, cirrhosis, men, (age >40 in Asian men, >50 in Asian women, and >20 in African descent)
- consider pharmacological therapy if:
  - HBeAg positive + HBV-DNA >20,000 IU/mL + ALT >90; or
  - HBeAg negative + HBV-DNA >2,000 IU/mL + ALT >90 + stage ≥2 fibrosis on liver biopsy
  - treat to *prevent* flare when placed on immunosuppressive therapy such as prednisone
- treatment goal: reduce serum HBV-DNA to undetectable level
- treatment options: interferon, tenofovir, entecavir, lamivudine, adefovir
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions

### Hepatitis D

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with hepatitis B; causes more aggressive disease than hepatitis B virus alone
- co-infection: acquire HDV and HBV at the same time
  - better prognosis than superinfection (acute HDV infection on pre-existing HBV infection)
- HDV can present as fulminant hepatic failure (FHF) and/or accelerate progression to cirrhosis
- management: low-dose interferon (20% response) and liver transplant for end-stage disease

Risk of hepatocellular carcinoma in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis.

Risk of hepatocellular carcinoma in HCV increases only after cirrhosis develops.

Without treatment, 8-20% of those with ongoing immunoactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury.

In acute hepatitis B, HDV co-infection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis.

## Hepatitis C Virus (HCV)

- RNA virus
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- clinical manifestation develops 6-8 wk after exposure
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

## Diagnosis

- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- virus genotype correlates with response to treatment but not prognosis
  - serum HCV-RNA inversely correlates with response to treatment
- normal transaminases can have underlying cirrhosis on biopsy, but otherwise excellent prognosis

## Management

- blood-borne precautions; vaccinate for hepatitis B and A if serology negative, avoid alcohol
- clearest indication for treatment is in subgroup likely to develop clinically significant liver disease
  - persistently elevated transaminases, liver biopsy shows fibrosis/cirrhosis and at least moderately severe necrosis/inflammation
- indicators of poor response to treatment: cirrhosis, genotype 1, high HCV-RNA, co-infection with HIV, African-American race
- pegylated interferon- $\alpha$  + ribavirin aims to clear HCV infection, but only 50-80% success rate and side effects common (therefore not all patients are treated)
  - “sustained remission” = undetectable HCV-RNA 6 mo off treatment (which generally means that HCV has been successfully eradicated)
  - pegylated interferon- $\alpha$  SC injection weekly and ribavirin PO bid and add proteinase inhibitor PO (bocepravir or telaprevir) for genotype 1
- length of treatment determined by time required for HCV-RNA to fall
- measure HCV-RNA at 1 and 3 mo after starting treatment
- adverse effects: depression/fatigue, hemolysis, bone marrow suppression (monitor CBC regularly), fevers/myalgia, precipitates autoimmune diseases (rare), skin rashes
- recently introduced proteinase inhibitors for genotype I (most common, least amenable to treatment) have significantly increased sustained remission rate to up to 70%

HCV treatment lowers the risk of hepatocellular carcinoma.

### Risk Factors for Progression

- EtOH
- HIV co-infection
- Old age at diagnosis

## Prognosis

- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- risk of hepatocellular carcinoma increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

**Table 15. Characteristics of the Viral Hepatitides**

	HAV	HBV	HCV	HDV	HEV	CMV	EBV	Yellow Fever
<b>Virus Family</b>	<i>Picornaviridae</i>	<i>Hepadnaviridae</i>	<i>Flaviviridae</i>	<i>Deltaviridae</i>	<i>Caliciviridae</i>	<i>Herpesviridae</i>	<i>Herpesviridae</i>	<i>Flavivirus</i>
<b>Genome</b>	RNA	DNA	RNA	RNA	RNA	DNA	RNA	RNA
<b>Envelope</b>	No	Yes	Yes	Yes	No	Yes	Yes	Yes
<b>Transmission</b>	Fecal-oral	Parenteral/sexual or equivalent Vertical	Parenteral /sexual (transfusion, IVDU, sexual (<HBV)) 40% have no known risk factors	Non-parenteral (close contact in endemic areas) Parenteral (blood products, IVDU)-sexual transmission is inefficient	Fecal-oral (endemic: Africa, Asia, central America, India, Pakistan)	Close contacts, most body fluids	Saliva-oral	Vector
<b>Incubation</b>	4-6 wk	6 wk-6 mo	2-26 wk	3-13 wk	2-8 wk	20-60 d	30-50 d	3-6 d
<b>Onset</b>	Usually abrupt	Usually insidious	Insidious	Usually abrupt	Usually abrupt	Variable	Variable	Usually abrupt
<b>Communicability</b>	2-3 wk in late incubation to early clinical phase Acute hepatitis in most adults, 10% of children	HBsAg + state highly communicable Increased during third trimester or early post-partum	Communicable prior to overt symptoms and throughout chronic illness	Infectious only in presence of HBV (HBsAg required for replication)	Unknown	Variable – dormant or persistent	Communicable highest during year after primary infection but never zero	Variable, vector-dependent
<b>Chronicity</b>	None, although can relapse	5% adults, 90% infants	80%, 20% of which develop cirrhosis	5%	None	Common; latent	Common; latent	Infection confers lifelong immunity
<b>Serology</b>	Anti-HAV (IgM)	See Table 15	HCV-RNA Anti-HCV (IgG/IgM)	HBsAg Anti-HDV (IgG/IgM)	Anti-HEV (IgG/IgM)	Anti- CMV (IgM/IgG)	Monospot; anti-EBV IgM/IgG, EBV DNA quantitation	Anti-YF (IgM/IgG)
<b>Immunity</b>	Yes	Yes	?	Yes	?	?	?	Yes
<b>Vaccine</b>	Havrix, 2 doses q6mo, combined with Twinrix at 0, 7, and 21 d	Recombivax HB TM, age 11-15, 2 doses q6mo	No	No	No	No	No	YF-VAX, 1 dose booster q10yr
<b>Management</b>	General hygiene Treat close contacts (anti-HAV Ig) Prophylaxis for high-risk groups (HAV vaccine $\pm$ HAV Ig) unless immune	Prevention: HBV vaccine and/or hepatitis B Ig (HBIG) for needlestick, sexual contact, infants of infected mothers unless already immune	Prevention: no vaccine Rx: IFN + ribavirin	Prevention: HBV vaccine	Prevention: general hygiene, no vaccine	In high risk transplant patients: CMV IG and anti-virals (ganciclovir, valganciclovir)	Supportive treatment post infection	Prevention Supportive treatment post infection

**Table 15. Characteristics of the Viral Hepatitis** (continued)

	HAV	HBV	HCV	HDV	HEV	CMV	EBV	Yellow Fever
<b>Acute mortality</b>	0.1-0.3%	0.5-2%	1%	2-20% coinfection with HBV, 30% superinfection Predisposes HBV carriers to more severe hepatitis and faster progression to cirrhosis	1-2% overall, 10-20% in pregnancy	Rare in immunocompetent adults	Rare	20-60% in developing countries
<b>Oncogenicity</b>	No	Yes	Yes	?	No	No	Yes	No
<b>Complications</b>	Can cause fulminant hepatic failure and subsequent death (<1-5%)	Hepatocellular carcinoma secondary to cirrhosis, Serum sickness-like syndrome, glomerulonephritis, cryoglobulinemia, polyarteritis nodosa, porphyria cutanea tarda	Hepatocellular carcinoma in 2-5% of cirrhosis per year, cryoglobulinemia, B-cell non-Hodgkin lymphoma	Leukocytoclastic vasculitis, membranous glomerulonephropathy	Mild, except in third trimester (10-20% fulminant liver failure)	5% of newborns with multiple handicaps Immunocompromised patients at risk of CMV-induced hepatitis, retinitis, colitis, esophagitis, pneumonitis	Associated with Burkitt's lymphoma and nasopharyngeal carcinoma (rare in Western world)	Can cause a recurrent toxic phase with liver damage, GI bleeding, and high mortality rates

## Autoimmune Chronic Active Hepatitis

- diagnosis of exclusion: rule out viruses, drugs, metabolic or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
  - hypergammaglobulinemia
    - ♦ anti-smooth muscle antibody elevation is most characteristic; also elevations in anti-LKM (liver kidney microsome, especially in children)
      - less specific: elevated ANA, RF
    - ♦ can have false positive viral serology (especially anti-HCV)
    - ♦ biopsy – periportal (zone 1) and “interface” inflammation and necrosis
- management: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)

## Drug-Induced Liver Disease

**Table 16. Classification of Hepatotoxins**

	Direct	Indirect
<b>Example</b>	Acetaminophen, CCl <sub>4</sub>	Phenytoin, INH
<b>Dose-dependence</b>	Usual	Unusual
<b>Latent period</b>	Hours-days	Weeks-months
<b>Host factors</b>	Not important	Very important
<b>Predictable</b>	Yes	No (idiosyncratic)

**Hy's Law:** drug-induced hepatocellular jaundice indicates a mortality of at least 10%.

### Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause FHF (transaminases >1,000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite is formed → covalently binds to hepatocyte membrane
  - presentation:
    - ♦ first 24 h: nausea and vomiting (usually within 4-12 h of overdose)
    - ♦ 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - ♦ >48 h: continued hepatic necrosis possibly complicated with FHF or resolution
    - ♦ note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy:
    - ♦ gastric lavage/emesis (if <2 h after ingestion)
    - ♦ oral activated charcoal
    - ♦ N-acetylcysteine (NAC, Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
      - promotes hepatic glutathione regeneration
    - ♦ no recorded fatal outcomes if NAC given before increase in transaminases
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus and eosinophilia

- INH (isoniazid)
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- methotrexate
  - causes cirrhosis; increased risk in the presence of obesity, diabetes, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methylodopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, chinese herbs (e.g. germander, comfrey, bush tea)

## Wilson's Disease

### Definition

- autosomal recessive defect in copper metabolism (gene ATP7B)

### Pathology

- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin

### Clinical Manifestations

- liver: acute hepatitis, fulminant liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
- eyes: Kayser-Fleischer rings (copper deposits in Descemet's membrane); more common in patients with CNS involvement, present in 50% if only liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi's syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

#### Clinical Manifestations of Wilson's Disease

##### ABCD

##### Asterixis

Basal ganglia degeneration: suspect if parkinsonian features in the young

Ceruloplasmin ↓

##### Cirrhosis

Corneal deposits (Kayser-Fleischer ring)

Copper

Dementia

### Investigations

- suspect if increased liver enzymes with clinical manifestations at young age (<30); especially combination of liver disease with dystonia, psychiatric symptoms
- screening tests:
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion
- gold standard:
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in ATP7B are possible

### Treatment

- 4 drugs available:
  1. penicillamine chelates copper, poorly tolerated
  2. trientine chelates copper
  3. zinc impairs copper excretion in stool/ decreases copper absorption from gut
  4. tetrathiomolybdate preferred if neurological involvement
- screen relatives
- liver transplant in severe cases

## Hemochromatosis

### Definition

- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20-40 g (normal 1 g)

### Etiology

- primary hemochromatosis
  - primarily due to common recessive gene (HFE, 5%); 1/400 patients are homozygotes
  - results in ongoing gut absorption of iron despite adequate iron stores
- secondary hemochromatosis
  - parenteral iron overload (e.g. transfusions)
  - chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency
  - excessive iron intake

Gene mutation not 100% penetrant: so not all with homozygous gene defect have clinically significant iron overload.

### Clinical Features

- usually presents with trivial elevation in serum transaminases
- liver: cirrhosis (30%), HCC (200x increased risk) – most common cause of death (1/3 of patients)
- pancreas: diabetes, chronic pancreatitis
- skin: bronze or grey (due to melanin, not iron)
- heart: dilated cardiomyopathy
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis

### Investigations

- screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease)
  - transferrin saturation (free  $\text{Fe}^{2+}$ /TIBC) >50%
  - serum ferritin >400 ng/mL
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- liver biopsy (to define degree of iron overload and to detect cirrhosis)
  - usually indicated if age >40, ALT/AST more than 2.5 times the upper limit of normal, or ferritin >1000
- HCC screening if cirrhosis

### Treatment

- phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

### Prognosis

- normal life expectancy if treated before the development of cirrhosis or diabetes

Ferritin may never normalize if other causes of high ferritin present (e.g. fatty liver from metabolic syndrome or alcohol).

## Alcoholic Liver Disease

### Types of Lesions

- fatty liver (all alcoholics): always reversible if alcohol stopped
- alcoholic hepatitis (35% of alcoholics): usually reversible if alcohol stopped
- cirrhosis (10-15% of alcoholics): potentially irreversible

### Pathophysiology

- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde:
  - reduces  $\text{NAD}^+$  to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
  - binds to hepatocytes evoking an immune reaction
- ethanol increases gut permeability leading to increased bacterial translocation
- alcohol metabolism causes:
  - relative hypoxia in liver zone III > zone I
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis:
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

### Clinical Features

- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10 to 20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver:
  - mildly tender hepatomegaly; jaundice rare
  - mildly increased transaminases <5x normal
- alcoholic hepatitis:
  - variable severity: mild to fatal liver failure
  - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice and mildly elevated INR)
  - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

#### Standard Drink Equivalent

1 standard drink = 14 g EtOH  
 = 12 oz beer (5% alcohol)  
 = 5 oz wine (12-17%)  
 = 3 oz fortified wine (17-22%)  
 = 1.5 oz liquor (40%)

Tip: Percentage alcohol multiplied by oz roughly equals 60

#### Biopsy + Histology of Alcoholic Hepatitis (triad)

- Hepatocyte necrosis with surrounding inflammation in zone III
- Mallory bodies (intracellular eosinophilic aggregates of cytokeratins)
- Chicken-wire fibrosis (network of intralobular connective tissue surrounding cells and venules)

- blood tests are non-specific, but in general:
  - AST:ALT >2:1 (usually <300)
  - increased GGT
  - CBC: increased MCV (mean corpuscular volume), increased WBC
- prognosis: Maddrey's discriminant function (based on PT and bilirubin) predicts mortality

### Treatment

- alcohol cessation (see [Psychiatry](#), PS22)
  - Alcoholics Anonymous, disulfiram, naltrexone, acamprosate
- multivitamin supplements (especially thiamine)
- caution with drugs metabolized by the liver
- prednisone 40 mg OD x 28 d (taper over 2-4 wk) in subgroup with elevated bilirubin and INR, or if encephalopathy; but contraindicated in GI bleeding, renal failure, infection
- pentoxifylline decreases TNF, shown in one trial to reduce death, albeit only from renal failure, favourable side-effect profile

### Prognosis

- fatty liver: complete resolution with cessation of alcohol intake
- alcoholic hepatitis mortality
  - immediate: 30%-60% in the first 6 mo if severe
  - with continued alcohol: 70% in 5 yr
  - with cessation: 30% in 5 yr

### GI Complications of Alcohol Abuse

- **Esophagus**
  - Mallory-Weiss tear
  - Esophageal varices (secondary to portal hypertension)
- **Stomach**
  - Alcoholic gastritis
- **Pancreas**
  - Acute pancreatitis
  - Chronic pancreatitis
- **Liver**
  - Alcoholic hepatitis
  - Fatty liver
  - Cirrhosis
  - Hepatic encephalopathy
  - Portal hypertension (secondary to cirrhosis)
  - Ascites (secondary to cirrhosis)
  - HCC (secondary to cirrhosis)

## Non-Alcoholic Fatty Liver Disease (NAFLD)

### Etiology/Epidemiology

- spectrum of disorders characterized by macrovesicular hepatic steatosis
- most common cause of liver disease in North America

### Pathophysiology

- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

### Risk Factors

- likely a component of the metabolic syndrome along with type II diabetes, hypertension, hypertriglyceridemia
- rapid weight loss or weight gain

### Clinical Features/Investigations

- often asymptomatic
- may present with fatigue, malaise and vague RUQ discomfort
- elevated serum triglyceride/cholesterol levels and insulin resistance
- elevated serum AST, ALT  $\pm$  ALP; AST/ALT <1
- presents as echogenic liver texture on ultrasound
- liver biopsy diagnostic, but often necessary only for prognosis

### Management

- no proven effective therapy other than gradual weight loss
- some evidence for vitamin E (800 U daily); pioglitazone if diabetes concomitantly present
- modification of risk factors is generally recommended, especially gradual weight reduction
- optimization of therapy for diabetes, hyperlipidemia, hypertension

### Prognosis

- most die from cardiovascular or cerebrovascular disease
- better prognosis than alcoholic hepatitis
  - <25% progress to cirrhosis over a 7-10 yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavourable prognosis: diabetes, age, metabolic syndrome

## Acute Liver Failure (ALF; Formerly Fulminant Hepatic Failure)

### Definition

- severe decline in liver function characterized by coagulation abnormality (INR > 1.5) and encephalopathy
- in setting of previously normal liver
- rapid (< 26 wk duration)

### Etiology

- drugs (especially acetaminophen), hepatitis B (measure IgM anti-HBc because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

### Management

- correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, vigilant for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value is to exclude chronic disease, less helpful for prognosis
- liver transplant: consider early, especially if time from jaundice to encephalopathy > 7 d (e.g. not extremely rapid), age < 10 or > 40, cause is drug or unknown, bilirubin > 300  $\mu\text{mol/L}$ , INR > 3.5, creatinine > 200  $\mu\text{mol/L}$

## Cirrhosis

### Definition

- liver damage characterized by diffuse distortion of the basic architecture and replacement with scar tissue and formation of regenerative nodules
- Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
- Stage 2 cirrhosis is the onset of first decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy

### Etiology

- fatty liver (alcohol, metabolic syndrome)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- hemochromatosis
- $\alpha$ 1-antitrypsin deficiency
- primary biliary cirrhosis
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- idiopathic
- rare: Wilson's disease, Gaucher's disease

### Diagnosis

- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive:
  - blood work: fall in platelet count < 150 is the earliest finding, followed many yr later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event; see Figure 13)
  - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging:
    - ♦ U/S is the primary imaging modality but only finds advanced cirrhosis
    - ♦ CT to look for varices, nodular liver texture, splenomegaly, ascites
    - ♦ FibroScan: non-invasive tool using elastography (variable availability)
  - gastroscopy: varices or portal gastropathy

### Management

- treat underlying disorder
- decrease insults (e.g. alcohol cessation, hepatotoxic drugs)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh Score (see Table 17)
- liver transplantation for end-stage disease if no alcohol for > 6 mo; use MELD stratification (see sidebar)

Fibrosis may regress and disappear if cause of liver injury is treated or resolves.

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC.

**Figure 13. Progression of liver dysfunction based on liver function tests – the “W”**

#### MELD (Model for End Stage Liver Disease)

- Predicts 3-mo survival and used to stratify patients on transplant list
- Based on creatinine, INR and total bilirubin

**Table 17. Child-Pugh Score and Interpretation**

Classification	1	2	3
Serum bilirubin ( $\mu\text{mol/L}$ )	<34	34-51	>51
Serum albumin (g/L)	>35	28-35	<28
INR	<1.7	1.7-2.3	>2.3
Presence of ascites	Absent	Controllable	Refractory
Encephalopathy	Absent	Minimal	Severe
Interpretation			
Points	Class	Life Expectancy	Perioperative Mortality
5-6	A	15-50 yr	10%
7-9	B	Candidate for transplant	30%
10-15	C	1-3 mo	82%
Score: 5-6 (Child's A), 7-9 (Child's B), 10-15 (Child's C)			

\*Note: Child's classification is rarely used for shunting, but is still useful to quantitate the severity of cirrhosis

## Complications

- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR, thus tendency for bruising and bleeding
- variceal bleeds
  - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%
  - hepatic venous pressure gradient (HVPG)  $\geq 10$  mmHg is the strongest predictor of variceal development
  - management: resuscitation, antibiotic prophylaxis, vasoactive drugs combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
  - classifications
    - pre-renal (usually due to over-diuresis)
    - acute tubular necrosis (ATN)
    - hepatorenal syndrome (HRS)
      - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - Type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
    - HRS can occur at any time in severe liver disease, especially after:
      - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
      - GI bleed
      - sepsis
    - treatment for hepatorenal syndrome (generally unsuccessful at improving long term survival)
      - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
      - definitive treatment is liver transplant
- hepatopulmonary syndrome
  - majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal hypertension
  - thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
  - clinical features:
    - hyperdynamic circulation with cardiac output  $>7$  L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
    - dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency) and orthodeoxia (desaturation in the upright position, improved by recumbency)
    - diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
    - only proven treatment is liver transplantation

### Cirrhosis Complications

#### VARICES

Varices  
Anemia  
Renal failure  
Infection  
Coagulopathy  
Encephalopathy  
Sepsis

### Hepatorenal Syndrome vs. Pre-renal Failure – difficult to differentiate:

- Similar blood and urine findings, (see [Nephrology](#), NP33)
- Urine sodium: very low in hepatorenal; low in pre-renal
- Intravenous fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome

### Hepatopulmonary Syndrome

#### Clinical triad:

- Liver disease
- Increased alveolar-arterial gradient while breathing room air
- Evidence for intrapulmonary vascular abnormalities

Figure 14. Clinical features of liver disease

#### Portal Hypertension

##### Signs

- Esophageal varices
- Melena
- Splenomegaly
- Ascites
- Hemorrhoids

##### Management

- $\beta$ -blockers
- Nitrates
- Shunts [e.g. transjugular intrahepatic portosystemic shunt (TIPS)]

## Hepatocellular Carcinoma (HCC)

- see [General Surgery](#), GS43

## Liver Transplantation

- see [General Surgery](#), GS44

## Portal Hypertension

### Definition

- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure)  $>5$  mmHg

### Pathophysiology

- 3 sites of increased resistance (remember pressure = flow  $\times$  resistance)
  - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

### Complications

- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

### Management

- non-selective  $\beta$ -blockers (propranolol, nadolol) decrease risk of bleeding from varices
- transjugular intrahepatic portosystemic shunt (TIPS): to decrease portal venous pressure
  - shunt between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - shunt usually remains open for  $<1$  yr
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction
  - most commonly used as a "bridge" to liver transplant
- other surgically created shunts (rare): portacaval, distal spleno-renal (Warren shunt)

## Hepatic Encephalopathy

### Definition

- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

### Pathophysiology

- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

### Precipitating Factors

- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

### Stages

- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness, disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar responses
- IV: coma (response to painful stimuli only)

### Investigations

- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out:
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves

### Treatment

- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - decrease dietary protein to 50 g/d; vegetable protein is better tolerated than animal protein
  - lactulose: titrated to achieve 2 to 3 soft stools per day
    - ♦ prevents diffusion of  $\text{NH}_3$  (ammonia) from the colon into blood by lowering pH and forming non-diffusible  $\text{NH}_4$  (ammonium)
    - ♦ serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - ♦ also acts as a laxative to eliminate nitrogen-producing bacteria from colon
- if inadequate response with lactulose may try antibiotics
  - broad-spectrum antibiotics (metronidazole, rifaximin) eliminate ammonia producing bacteria from bowel lumen
  - non-absorbable antibiotic rifaximin probably most effective treatment but only available through special access in Canada
- best acute treatment in comatose patient is tap water or lactulose enemas

#### Precipitating Factors for Hepatic Encephalopathy

##### HEPATICS

Hemorrhage in GI tract/Hypokalemia  
Excess dietary protein  
Paracentesis  
Alkalosis/Anemia  
Trauma  
Infection  
Colon surgery  
Sedatives

## Ascites

### Definition

- accumulation of excess fluid in the peritoneal cavity

### Etiology

**Table 18. Serum-Ascites Albumin Gradient as an Indicator of the Causes of Ascites**

Serum [Alb] – Ascitic [Alb] >11 g/L (1.1 g/dL) Portal Hypertension Related	Serum [Alb] – Ascitic [Alb] <11 g/L (1.1 g/dL) Non-portal Hypertension Related
Cirrhosis/severe hepatitis	Peritoneal carcinomatosis
Chronic hepatic congestion (right heart failure, Budd-Chiari)	TB
Massive liver metastases	Pancreatic disease
Myxedema	Serositis
	Nephrotic syndrome*

\* In nephrotic syndrome: decreased serum [Alb] to begin with therefore gradient not helpful

Secondary bacterial peritonitis (as opposed to primary bacterial peritonitis) usually results from a perforated viscus or surgical manipulation.

### Pathogenesis

- key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  - underfill hypothesis: first step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney
  - overflow hypothesis: cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily
  - peripheral arterial vasodilation theory (most popular): as portal hypertension develops in cirrhosis, production of local mediators such as nitric oxide lead to splanchnic arterial vasodilation which ultimately results in reduction of effective arterial volume and compensatory sodium and fluid retention by the kidneys (i.e. circulation volume is increased, as per overflow hypothesis, but relatively underfilled, as per underfill hypothesis)

#### Serum Ascites Albumin Gradient

- >11 g/L portal HTN
- <11 g/L unrelated to portal HTN

## Diagnosis

- abdominal ultrasound
- physical exam (clinically detectable when >500 mL):
  - bulging flanks, shifting dullness, fluid-wave test positive
  - most sensitive symptom: ankle swelling

## Investigations

- diagnostic paracentesis
  - 1<sup>st</sup> aliquot: cells and differential
  - 2<sup>nd</sup> aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis, TG if turbid and suspect chylous ascites)
  - 3<sup>rd</sup> aliquot: C&S, Gram stain
  - 4<sup>th</sup> aliquot: cytology (usually positive in peritoneal carcinomatosis)

## Treatment

- non-refractory ascites:
  - Na<sup>+</sup> restriction (daily sodium intake <2 g)
  - diuretics: spironolactone, furosemide
  - aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  - double diuretic dose every 2-4 wk to achieve weight loss target
- refractory ascites (treatment with diuretics are inadequate or not tolerated):
  - therapeutic/palliative paracentesis indicated
  - IV albumin (not indicated if <5 L removed by paracentesis)
  - TIPS usually provides temporary benefit in controlling ascites but no survival advantage
  - liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis are associated with 50% 2-yr mortality

## Complication: Primary/Spontaneous Bacterial Peritonitis (SBP)

- primary/spontaneous bacterial peritonitis (SBP)
  - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: *E. coli* (most common), *Streptococcus*, *Klebsiella*
- diagnosis
  - absolute neutrophil count in peritoneal fluid >0.25x10<sup>9</sup> cells/L (250 cells/mm<sup>3</sup>)
  - Gram stain positive in only 10-50% of patients
  - culture positive in <80% of patients (not needed for diagnosis)
- prophylaxis: consider in patients with
  - cirrhosis or GI bleed: IV ceftriaxone daily or norfloxacin bid x 7 d
  - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
- treatment
  - IV antibiotics (cefotaxime 2 g IV q8h is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
  - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

### Primary Prophylaxis of Spontaneous Bacterial Peritonitis Delays Hepatorenal Syndrome and Improves Survival in Cirrhosis

*Gastroenterology* 2007;133:818-824

**Study:** RCT, double-blinded study with 1 yr follow-up.

**Population:** 68 patients with cirrhosis, ascites, ascitic fluid protein <15 g/L and impaired renal function or severe liver failure.

**Intervention:** General, regional or combined anesthesia to patients undergoing a surgical procedure.

**Main Outcome:** Norfloxacin versus placebo.

**Results:** There was a significant reduction of patients developing spontaneous bacterial peritonitis (SBP) (6% vs. 30%,  $p=0.02$ ) and spontaneous bacteremia (0% vs. 12%,  $p=0.05$ ) with norfloxacin therapy. There were significantly fewer patients who developed all-cause renal failure (7 vs. 16,  $p=0.03$ ) and hepatorenal syndrome (HRS) with norfloxacin therapy. Probability of survival at 3 mo (94% vs. 62%,  $p=0.02$ ) and 1 yr (60% vs. 48%,  $p=0.003$ ) were high in patients treated with norfloxacin.

**Conclusion:** Primary prophylaxis with norfloxacin in patients with advanced cirrhosis reduced SBP, HRS, and improved 1 yr survival.

# Biliary Tract

## Jaundice

- see Table 2, Figures 15 and 16

## Signs and Symptoms

- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer, although most patients with pancreatic cancer have pain
- kernicterus: rarely seen in adults due to maturation of blood brain barrier

## Investigations

- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- direct bile duct visualization
  - magnetic resonance cholangiopancreatography (MRCP): non-invasive
  - endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumours
  - endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
  - percutaneous transhepatic cholangiography (PTC): if ERCP fails, if obstruction is in liver

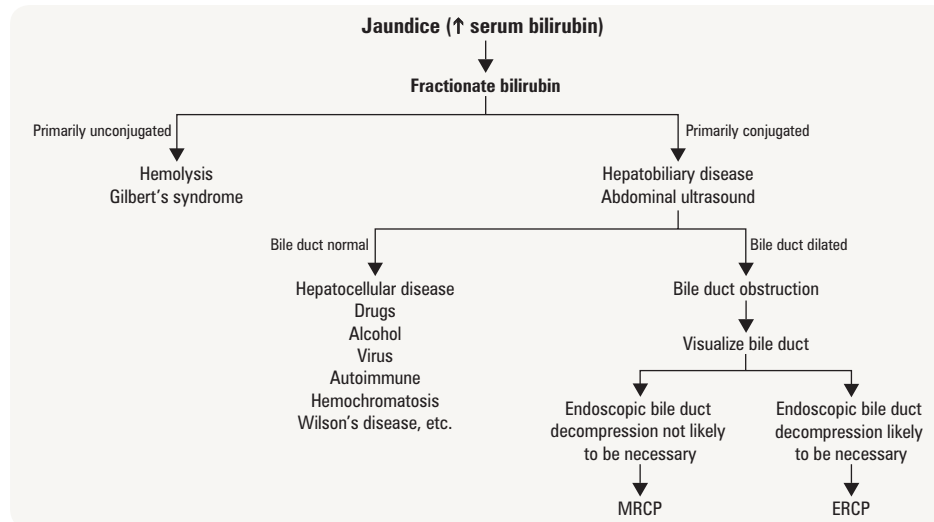

Figure 16. Approach to jaundice

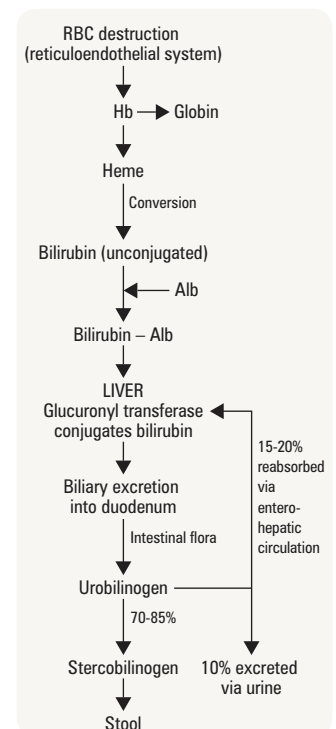

Figure 15. Production and excretion of bilirubin

## Gilbert's Syndrome

### Definition

- mild decrease in glucuronyltransferase activity leading to defective conjugation of bilirubin

### Etiology/Epidemiology

- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

### Signs and Symptoms

- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting; no other clinical implications

### Treatment

- none indicated (entirely benign)

### Gilbert's Syndrome vs. Crigler-Najjar Syndrome

**Gilbert's Syndrome:** mild decrease in glucuronyltransferase activity.

**Crigler-Najjar Syndrome:** complete deficiency of glucuronyltransferase.

## Sclerosing Cholangitis

### Definition

- inflammation of biliary tree (intra and/or extrahepatic bile ducts) leading to scarring and lumen obliteration

### Etiology

- primary/idiopathic (most common)
  - associated with IBD, more commonly UC, in up to 70% of patients (usually male)
  - one of the most common indications for transplant
- secondary (less common)
  - long-term choledocholithiasis
  - cholangiocarcinoma
  - surgical/traumatic injury (iatrogenic)
  - contiguous inflammatory process
  - post-ERCP
  - associated with HIV/AIDS ("HIV cholangiopathy")

**Signs and Symptoms**

- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

**Diagnosis**

- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)
- ERCP shows narrowing and dilatations of bile ducts that may result in “beading”, both intrahepatic and extrahepatic bile ducts
  - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

**ERCP**

- Absence of narrowing in PBC
- Narrowing of intra and extrahepatic ducts in PSC

**Complications**

- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

**Management**

- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma
- endoscopic sphincterotomy, biliary stent in selected cases of dominant CBD stricture
- antibiotics for cholangitis
- suppurative cholangitis requires emergency drainage of pus in CBD
- liver transplantation appears the best treatment for advanced sclerosing cholangitis (nearly 90% 1-yr survival; mean follow-up from time of diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

**Prognosis**

- unfavourable regardless of treatment
- mean survival after diagnosis remains 4-10 yr

## Primary Biliary Cirrhosis (PBC)

**Definition**

- chronic inflammation and fibrous obliteration of intrahepatic bile ductules

**Etiology/Epidemiology**

- likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome, RA, thyroiditis)
- affects mainly middle-aged women (M:F = 1:9)

**Signs and Symptoms**

- often asymptomatic
- initial symptoms: pruritus, fatigue
- chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
- end-stage: hepatocellular failure, portal hypertension, ascites
- high incidence of osteoporosis

**Investigations**

- increased ALP, GGT; bilirubin rises in later stage
- positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
- increased serum cholesterol (mild increase in LDL, larger increase in HDL)
  - may have: xanthelasmas, xanthomas
- liver biopsy confirms diagnosis and stages severity
- normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
- recently described “overlap” syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis

**Clinical Course**

- can be fatal, although not all asymptomatic patients show progression

**Treatment**

- treat with ursodiol (less frequently colchicine, methotrexate)
- cholestyramine (for pruritus and hypercholesterolemia)
- calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
- monitor for thyroid disease
- liver transplant if disease severe, progressive

Table 19. Primary Sclerosing Cholangitis vs. Primary Biliary Cirrhosis

	Primary Sclerosing Cholangitis	Primary Biliary Cirrhosis
<b>Predominant gender</b>	Male	Female
<b>Associated comorbidities</b>	IBD, especially UC	Other autoimmune disorders (Sjögren's, CREST, RA)
<b>Affected ducts</b>	Both intra- and extra-hepatic	Intrahepatic only
<b>Investigations</b>	ERCP/MRCP (narrowing and dilatations of ducts visualized)	Anti-mitochondrial antibodies, IgM, increased lipids, liver biopsy (absence of duct narrowing on ERCP)

## Secondary Biliary Cirrhosis

### Definition

- cirrhosis from prolonged partial or total obstruction of major bile ducts

### Etiology

- acquired: post-op strictures, chronic pancreatitis, sclerosing cholangitis, stone in bile duct
- congenital: cystic fibrosis (CF), congenital biliary atresia, choledochal cysts

### Diagnosis

- cholangiography and liver biopsy

### Treatment

- treat obstruction, give antibiotics for cholangitis prophylaxis

## Biliary Colic, Cholecystitis

- see [General Surgery](#), GS46

## Ascending Cholangitis

- see [General Surgery](#), GS48

### Definition

- infection of the biliary tree

### Etiology

- stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
- infection originates in the duodenum or spreads hematogenously from the portal vein
- bacteria
  - *E. coli*, *Klebsiella*, *Enterobacter*, *Enterococcus*
  - co-infection with *Bacteroides* and *Clostridia* can occur

### Signs and Symptoms

- Charcot's triad: fever, RUQ pain, jaundice (50-70%)
- Reynold's Pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

### Diagnosis

- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated
- blood culture
- abdominal U/S: CBD dilation, stones

### Treatment

- most important is drainage, ideally via ERCP, but if necessary by percutaneous biliary or surgical routes
- antibiotic therapy: broad spectrum to cover Gram-negatives, *Enterococcus*, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  - ampicillin + sulbactam or piperacillin/tazobactam
  - metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  - carbapenem monotherapy (e.g. imipenem or meropenem)

### Prognosis

- good with effective drainage and antibiotics in mild to moderate cases
- high mortality (~50%) in patients with Reynold's Pentad

#### Charcot's Triad

- RUQ pain
- Fever
- Jaundice

#### Reynold's Pentad

- Charcot's triad
- Hypotension
- Altered mental status

# Pancreas

## Pancreatic Enzyme Abnormalities

### Causes of Increased Serum Amylase

- pancreatic disease
  - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
  - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
  - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  - macroamylasemia

### Causes of Increased Serum Lipase

- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
  - macrolipasemia
  - renal failure

#### Pancreatic Enzymes

**TALC**  
 Trypsin  
 Amylase  
 Lipase  
 Chymotrypsin

When serum amylase >5x normal, the cause is almost always pancreatitis or renal disease.

## Acute Pancreatitis

### Etiology

Idiopathic: thought to be hypertensive sphincter or microlithiasis

Gallstones (45%)

Ethanol (35%)

Tumours: pancreas, ampulla, choledochocoele

Scorpion stings

Microbiological

- bacterial: *Mycoplasma*, *Campylobacter*, TB, *M. avium intracellulare*, *Legionella*, leptospirosis
- viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
- parasites: ascariasis, clonorchiasis, echinococcosis

Autoimmune: SLE, polyarteritis nodosa (PAN), Crohn's

Surgery/trauma

- manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer

Hyperlipidemia (TG >11.3 mmol/L; >1000 mg/dL), Hypercalcemia, Hypothermia

Emboli or ischemia

Drugs/toxins

- azathioprine, mercaptopurine, furosemide, estrogens, methyl dopa, H<sub>2</sub>-blockers, valproic acid, antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

When thinking about the causes of acute pancreatitis remember: **I GET SMASHED**, but vast majority due to gallstones or ethanol

### Pathogenesis

- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- in ethanol-related pancreatitis, pathogenesis is unknown
- in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

### Pathology

- mild (interstitial)
  - peri-pancreatic fat necrosis
  - interstitial edema
- severe (necrotic)
  - extensive peri-pancreatic and intra-pancreatic fat necrosis
  - parenchymal necrosis and hemorrhage → infection in 60%
  - release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
- severity of clinical features may not always correlate with pathology

- 3 phases:
  - local inflammation + necrosis → hypovolemia
  - systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
  - local complications 2 wk after presentation → pancreatic sepsis/abscess

### Signs and Symptoms

- pain: epigastric, noncolicky, constant
- can radiate to back
- may improve when leaning forward (Inglefinger's sign)
- tender rigid abdomen; guarding
- nausea and vomiting
- abdominal distention from paralytic ileus
- fever: chemical, not due to infection
- jaundice: compression or obstruction of bile duct
- Cullen's/Grey-Turner's signs
- tetany: transient hypocalcemia
- hypovolemic shock: can lead to renal failure
- acute respiratory distress syndrome
- coma

### Investigations

- increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- increased WBC, glucose, low calcium
- imaging: CT most useful for diagnosis and prognosis
  - x-ray: "sentinel loop" (dilated proximal jejunum), calcification and "colon cut-off sign" (colonic spasm)
  - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  - CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
  - ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum

### Prognosis

- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to:
  - shock
  - pulmonary edema
  - multi-organ dysfunction syndrome
  - GI ulceration due to stress
  - death
- mortality according to Ranson's criteria (see sidebar)
  - ≤2 criteria = <5% mortality
  - 3-4 criteria = 15-20%
  - 5-6 criteria = 40%
  - ≥7 criteria = >99%
  - multiple other prognostic indices available, more accurate than Ranson but difficult to remember (e.g. APACHE)

### Treatment

- goals (only supportive therapy available):
  - (1) hemodynamic stability
  - (2) analgesia
  - (3) oxygen
  - (4) stop progression of damage (difficult)
  - (5) treat local and systemic complications
- antibiotics controversial except in documented infection (use cephalosporins, imipenem)
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
  - beware third spacing of fluid, monitor urine output carefully
- NG suction (rests pancreas) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
  - recent evidence supports nasogastric enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H<sub>2</sub>-blockers, peritoneal lavage
- follow clinically and CT/ultrasound to exclude complications
- chief role of surgery is to drain fluid or excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for >2 wk to allow demarcation between viable and necrotic tissue)

#### Cullen's Sign

Periumbilical ecchymosis

#### Grey-Turner's Sign

Flank ecchymosis

#### Increased Amylase

- Sensitive, not specific

#### Increased Lipase

- Higher sensitivity and specificity
- Stays elevated longer

#### Ranson's Criteria: Prognostic Indicator of Mortality in Pancreatitis not due to Gallstones

##### At Admission

**G:** Blood Glucose >11 mmol/L (>200 mg/dL) (with no history of hyperglycemia)

**A:** Age >55

**L:** Serum LDH >350 IU/L

**A:** AST >250 IU/L

**W:** WBC >16 x 10<sup>9</sup>/L (16,000/mm<sup>3</sup>)

##### During First 48 h

**C:** Serum Calcium <2 mmol/L (<8 mEq/L)

**H:** Hematocrit drop >10%

**O:** Arterial PO<sub>2</sub> <60 mmHg

**B:** Base deficit >4 mmol/L (>4 mEq/L)

**B:** BUN rise >1.8 mmol/L (>5 mg/dL)

**S:** Estimated fluid Sequestration >6 L

- Difficult course if 2 criteria present
- High mortality if ≥3 criteria present

#### Prophylactic Antibiotics Cannot Reduce Infected Pancreatic Necrosis and Mortality in Acute Necrotizing Pancreatitis: Evidence from a Meta-analysis of Randomized Controlled Trials

*Am J Gastroenterol* 2008;103:104-110

**Purpose:** To review the effectiveness of IV antibiotics on pancreatic necrosis.

**Study Selection:** RCTs comparing antibiotics with placebo or no treatment.

**Results:** Seven trials (n= 467) were included. Antibiotics were not statistically superior to controls in reduction of infected necrosis and mortality.

**Conclusion:** Prophylactic antibiotics cannot reduce infected pancreatic necrosis and mortality in patients with acute necrotizing pancreatitis.

**Note:** In practice the temptation to give antibiotics for pancreatitis is mainly in the setting of a sick patient with fever and suggestive pancreatic necrosis on CT scan. It is difficult to determine whether pancreatic necrosis has become infected without aspiration biopsy. See *Curr Gastroenterol Rep* 2009;11:104-110

**Late Complications**

- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
  - drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
- infected necrosis/abscesses: antibiotics + percutaneous drainage, endoscopic vs. surgical
- bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: diabetes, pancreatic duct damage

## Chronic Pancreatitis

**Definition**

- irreversible damage to pancreas characterized by:
  - (1) pancreatic cell loss (from necrosis)
  - (2) inflammation
  - (3) fibrosis

**Etiology/Pathophysiology**

- alcohol (most common):
  - causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  - changes composition of pancreatic juice (e.g. increases viscosity)
  - decreases pancreatic secretion of pancreatic stone protein (lithostathine) which normally solubilizes calcium salts
    - ♦ precipitation of calcium within pancreatic duct results in duct and gland destruction
  - toxic effect on acinar and duct cells – directly or via increasing free radicals
  - acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
  - varying degrees of ductular dilatation, strictures, protein plugs, calcification
  - no satisfactory theory to explain why only a minority of alcoholics develop pancreatitis
- unusual causes
  - cystic fibrosis
  - severe protein-calorie malnutrition
  - hereditary
  - idiopathic

**Signs and Symptoms**

- early stages:
  - recurrent attacks of severe abdominal pain (upper abdomen and back)
  - chronic painless pancreatitis: 10%
- late stages: occurs in 15% of patients
  - malabsorption syndrome when >90% of function is lost, steatorrhea
  - diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

**Investigations**

- laboratory:
  - increase in serum glucose
  - increase in serum ALP, less commonly bilirubin (jaundice)
  - serum amylase and lipase usually normal
- AXR: looking for pancreatic calcifications
- U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
- MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
- EUS: abnormalities of pancreatic parenchyma and pancreatic ducts
- 72-h fecal fat test: measures exocrine function
- secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
- fecal pancreatic enzyme measurement (elastase-1, chymotrypsin) available only in selected centres

**Management**

- most common problem is pain, difficult to control
- general management:
  - total abstinence from alcohol
  - enzyme replacement may help pain by resting pancreas via negative feedback
  - analgesics
  - celiac ganglion blocks
  - time: pain decreases with time as pancreas “burns out”
- endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct

Gallstones only cause acute pancreatitis (not chronic pancreatitis).

**Symptoms of Chronic Pancreatitis**

- Abdominal pain
- Diabetes
- Steatorrhea

**Etiology** = Almost Always Alcohol

**Treatment**

- Alcohol abstinence
- Pancreatic enzyme replacement
- Analgesics
- Pancreatic resection if ductular blockage

- surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
- steatorrhea:
  - pancreatic enzyme replacement
  - restrict fat, increase carbohydrate and protein (may also decrease pain)
  - neither endoscopy nor surgery can improve pancreatic function

## Autoimmune Pancreatitis

- most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice  $\pm$  abdominal pain)

### Investigations

- histology: lymphocyte and plasma cell infiltration of pancreas
- imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
- serology: increased serum IgG4
- other organs involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

### Treatment

- responds to prednisone

## Clinical Nutrition

### Determination of Nutritional Status

- corrected weight loss [expressed as body mass index ( $\text{kg}/\text{m}^2$ )] is most important parameter in assessing need for nutritional support

### Investigations

- plasma proteins: albumin, pre-albumin (shorter half life than albumin), transferrin
  - decrease may indicate decreased nutritional status or disease state
- thyroid-binding globulin, retinol-binding protein (may be too sensitive)
- anthropometry (e.g. triceps skinfold thickness), grip strength less often used

Table 20. Areas of Absorption of Nutrients

	Fe	CHO	Proteins, Lipids Na <sup>+</sup> , H <sub>2</sub> O	Bile Acids	Vit B <sub>12</sub>
Duodenum	+++	+++	+++	+	
Jejunum	+	+	++	+	+
Ileum	+	+	++	+++	+++

Hypomagnesemia may be an initial sign of short bowel syndrome in patients who have undergone surgical bowel resection.

#### Most Common Indications for Artificial Nutrition Support include:

- Preexisting nutritional deprivation
- Anticipated or actual inadequate energy intake by mouth
- Significant multiorgan system disease

## Enteral Nutrition (EN)

### Definition

- enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
- choice of tubes: nasogastric (NG), nasojejunal (NJ), percutaneous endoscopic gastrostomy (G-tube), percutaneous endoscopic jejunostomy (J-tube) or tubes can be placed radiologically, surgically

### Indications

- oral feeding inadequate or contraindicated

### Feeds

- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolality)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

### Relative Contraindications

- non-functioning gut (e.g. intestinal obstruction, enteroenteral or enterocutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

## Complications

- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein)

## Enteral Nutrition Advantages over Parenteral Nutrition

- far fewer serious complications (especially sepsis)
- nutritional requirements for enterally administered nutrition better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- prevents gallstones by stimulating gallbladder motility
- much less expensive

### Enteral versus Parenteral Nutrition for Acute Pancreatitis

*Cochrane DB of Syst Rev* 2010;1:CD002837

**Purpose:** Compare EN versus TPN on mortality, morbidity and hospital stay in patients with pancreatitis.

**Study Selection:** RCTs of TPN versus EN in pancreatitis.

**Results:** Eight trials (n=348) were included. Enteral nutrition decreases RR of death (0.50), multiple organ failure (0.55), infection (0.39) and other local complications (0.70). It also decreased hospital stay by 2.37 d.

**Conclusion:** EN reduces mortality, organ failure, infections and length of hospital stay in patients with pancreatitis.

## Parenteral Nutrition (PN)

### Definition

- parenteral nutrition is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

### Indications

- short term (<1 mo)
  - whenever GI tract not functioning
  - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively and difficult to control sepsis
  - preoperative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
  - renal failure: PN shown to increase rate of recovery; no increase in survival
  - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival
  - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)
  - some evidence for efficacy, but convincing data not available for:
    - ♦ radiation/chemotherapy-induced enteritis
    - ♦ AIDS with wasting diarrhea
    - ♦ severe acute pancreatitis
- long term (>1 mo): can be given at home
  - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
  - following surgical resection of >70% of bowel (e.g. bowel infarction)
  - severe motility diseases (e.g. scleroderma affecting bowel)

### Relative Contraindications

- functional GI tract for enteral nutrition
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem
- unreliable patient or clinical setting

### Complications of PN

- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: CHF, hyperglycemia, gallstones, cholestasis

Whenever possible, enteral nutrition is ALWAYS preferable over parenteral nutrition!

## Common Medications

**Table 21. Common Drugs Prescribed in Gastroenterology**

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
<b>Proton Pump Inhibitors</b> (H <sup>+</sup> /K <sup>+</sup> -ATPase inhibitors)	omeprazole	Losec®/Prilosec®	20 mg PO OD	Inhibits gastric enzymes H <sup>+</sup> /K <sup>+</sup> -ATPase (proton pump)	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, reflux esophagitis, symptomatic GERD, dyspepsia, Zollinger-Ellison syndrome, eradication of <i>H. pylori</i> (combined with antibiotics)	Hypersensitivity to drug	Dizziness, headache, flatulence, abdominal pain, nausea, rash, increased risk of osteoporotic fracture (secondary to impaired calcium absorption)
	lansoprazole or dexlansoprazole	Prevacid® Kapidex®	Oral therapy: 15-30 mg OD (before breakfast) IV therapy: 30 mg OD	Same as above	Same as above	Same as above	Same as above
	pantoprazole	Pantoloc® Protonix®	40 mg PO OD for UGIB: 80 mg IV bolus then 8 mg/h infusion	Same as above	Same as above and UGIB	Same as above	Same as above
	rabeprazole	Pariet®/Aciphex®	40 mg PO OD	Same as above	Same as above	Same as above	Same as above
	esomeprazole	Nexium®	20-40 mg PO OD	Same as above	Same as above	Same as above	Same as above
<b>Histamine H<sub>2</sub>-receptor Antagonists</b>	ranitidine	Zantac®	300 mg PO OD or 150 mg bid  IV therapy: 50 mg q8h (but tachyphylaxis a problem)	Inhibits gastric histamine H <sub>2</sub> -receptors	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, ulcer prophylaxis, reflux esophagitis, symptomatic GERD, Zollinger-Ellison syndrome	Hypersensitivity to drug	Confusion, dizziness, headache, arrhythmias, constipation, nausea, agranulocytosis, pancytopenia, depression
	famotidine	Pepcid®	Oral therapy: duodenal/gastric ulcers: 40 mg qhs GERD: 20 mg bid IV therapy: 20 mg bid	Same as above	Same as above	Same as above	Same as above
<b>Stool Softener</b>	docusate sodium	Colace®	100-400 mg daily, divided in 1-4 doses	Promotes incorporation of water into stool	Relief of constipation	Presence of abdominal pain, fever, nausea and vomiting	Throat irritation, abdominal cramps, rashes
<b>Osmotic Laxatives</b>	lactulose	Lactulose/ Constulose®	Constipation: 15-30 mL OD to bid Encephalopathy: 15-30 mL bid to qid	Poorly absorbed in GI tract and is broken down by colonic bacteria into lactic acid into colon, increased osmotic colonic contents, increases stool volume	Chronic constipation, prevention and treatment of portal-systemic encephalopathy	Patients who require a low galactose diet	Flatulence, intestinal cramps, nausea, diarrhea if excessive dosage
	PEG3350	Lax-a-day®/ Golytely®	Constipation: 17 g powder dissolved in 4-8 oz liquid PO OD	Osmotic agent causes water retention in stool and promotes frequency of stool	Relief of constipation Colonoscopy prep	Hypersensitivity to drug	Abdominal distension, pain, anal pain, thirst, nausea, rigor, tonic-clonic seizures (rare)
<b>Prokinetic Laxatives</b>	senna	Senokot®	Tablets: 1-4 PO qhs Syrup: 10-15 mL PO qhs	Induce peristalsis in lower colon	Constipation	Patients with acute abdomen	Abdominal cramps, discolouration of breast milk, urine, feces, melanosis coli and atonic colon from prolonged use (controversial)
	bisacodyl	Bisacodyl®	5-30 mg PO OD (start at 10 mg for bowel preparation)	Enteric nerve stimulation and local contact-induced secretory effects. Colonic movements	Constipation Preparation of bowel for procedure	GI obstruction Gastroenteritis	Abdominal colic, abdominal discomfort, proctitis (with suppository use), diarrhea
	metoclopramide	Maxeran®	See anti-emetics	See anti-emetics	See anti-emetics	See anti-emetics	See anti-emetics
<b>Bulk Laxatives</b>	psyllium	Metamucil®	2-6 tabs (1 tab = 0.52 g) PO qd-tid prn	Increases stool bulk → water retention in stool	Constipation	Hypersensitivity to drug GI obstruction	GI obstruction, diarrhea, constipation, abdominal cramps

**Table 21. Common Drugs Prescribed in Gastroenterology** (continued)

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
<b>Antidiarrheal Agents</b>	loperamide	Imodium®	Acute diarrhea: 4 mg PO initially, followed by 2 mg after each unformed stool	Acts as antidiarrheal via cholinergic, oncholingeric, opiate and nonopiate receptor-mediated mechanisms; decreases activity of myenteric plexus	Adjunctive therapy for acute non-specific diarrhea, chronic diarrhea associated with IBD and for reducing the volume of discharge for ileostomies, colostomies and other intestinal resections	Children <2 yr, known hypersensitivity to drug, acute dysentery characterized by blood in stools and fever, acute ulcerative colitis or pseudomembranous colitis associated with broad-spectrum antibiotics	Abdominal pain or discomfort, drowsiness or dizziness, tiredness, dry mouth, nausea and vomiting, hypersensitivity reaction
	diphenoxylate/atropine	Lomotil®	5 mg PO tid to qid	Inhibits GI propulsion via direct action on smooth muscle, resulting in a decrease in peristaltic action and increase in transit time	Adjunctive therapy for diarrhea, as above	Hypersensitivity to diphenoxylate or atropine, jaundice, pseudomembranous enterocolitis, diarrhea caused by enterotoxin producing bacteria	Dizziness, drowsiness, insomnia, headache, nausea, vomiting, cramps, allergic reaction
<b>Anti-emetics</b>	dimenhydrinate	Gravol®	25-50 mg PO/IV/IM q4-6h prn	Competitive H <sub>1</sub> receptor antagonist in GI tract, blood vessels, and respiratory tract. Blocks chemoreceptor trigger zone. Diminishes vestibular stimulation and disrupts labyrinthine function through central anticholinergic action	Motion sickness, radiation sickness, postoperative vomiting, and drug-induced nausea and vomiting	Hypersensitivity to drug	Xerostomia, sedation
	prochlorperazine	Stemetil®	5-10 mg PO/IV/IM bid-td pm	D <sub>1</sub> , D <sub>2</sub> receptor antagonist in chemoreceptor trigger zone and α adrenergic and anticholinergic effects. Depresses RAS affecting emesis	Post op nausea and vomiting, antipsychotic, anxiety	Hypersensitivity to drug	Dystonia, EPS, seizure, neuroleptic malignant syndrome (NMS) (rarely)
	metoclopramide	Maxeran®	10 mg IV/IM q2-3h pm, 10-15 mg PO qid (30 min before meals and qhs)	Dopamine and HT receptor antagonist in chemoreceptor trigger zone. Enhances response to Ach in upper GI tract, enhancing motility and gastric emptying. Increases LES tone	GER, diabetic gastroparesis, post op and chemotherapy induced nausea and vomiting, migraines, constipation	Hypersensitivity to drug, GI obstruction, perforation, hemorrhage, pheochromocytoma, seizures and EPS	Restlessness, drowsiness, dizziness, fatigue, EPS, some rare serious side effects include NMS, agranulocytosis
	ondansetron	Zofran®	Depends on procedure, generally 8-16 mg PO	Selective 5HT <sub>3</sub> receptor antagonist in central chemoreceptor trigger zone and peripherally on vagus nerve	Nausea and vomiting caused by cancer chemotherapy and radiation therapy. Multiple off label uses, including gastroenteritis nausea and vomiting	Morphine, hypersensitivity to drug	Constipation, diarrhea, increased liver enzymes, headache, fatigue, malaise, cardiac dysrhythmia
	granisetron	Kytril®	1 mg PO bid (for nausea from chemotherapy/radiation)	Same as above	Nausea and vomiting caused by cancer chemotherapy and radiation therapy	Same as above	Constipation, prolonged QT interval (rarely)
<b>IBD Agents</b>	mesalamine	Pentasa® Salofalk® Asacol® Mesasal®	CD: 1g tid/qid Active UC: 1g qid Maintenance UC: 1.6 g divided doses daily also as suppositories and enemas	5-ASA: Blocks arachidonic acid metabolism to prostaglandins and leukotrienes	IBD	Hypersensitivity to mesalamine salicylates	Abdominal pain, constipation, arthralgia, headache
	sulfasalazine	Salazopyrin®	3-4 g/d in divided doses	Compound composed of 5-ASA bound to sulfapyridine, hydrolysis by intestinal bacteria releases 5-ASA, the active component	Colonic disease	Hypersensitivity to sulfasalazine, sulfa drugs, salicylates; intestinal or urinary obstruction, porphyria	Rash, loss of appetite, nausea, vomiting, headache, oligospermia (reversible)
	prednisone		20-40 mg PO OD for acute exacerbation	Anti-inflammatory	Mod-severe CD and UC		Complications of steroid therapy
<b>Immuno-suppressive Agents</b>	6-mercaptopurine (6-MP)	Purinethol®	CD: 1.5 mg/kg/d	Immunosuppressive	IBD: active inflammation and to maintain remission	Hypersensitivity to mercaptopurine, prior resistance to mercaptopurine or thioguanine, history of treatment with alkylating agents, hypersensitivity to azathioprine, pregnancy	Pancreatitis, bone marrow suppression, increased risk of cancer
	azathioprine	Azasan® Imuran®	IBD: 2-3 mg/kg/d	Same as above	Same as above	Same as above	Same as above
<b>Immunomodulators</b>	infliximab	Remicade®	5-10 mg/kg IV over 2 h	Antibody to TNFα	Medically refractory CD	Heart failure, moderate to severe, doses >5 mg/kg	Reported cases of reactivated TB, PCP, lymphoma, other infections

## Landmark Gastroenterology Trials

Trial	Reference	Results
ALF	<i>Gastroenterology</i> 2009; 137:856-64	IV NAC was shown to improve transplant-free survival in patients with early non-acetaminophen related acute liver failure. Later stage disease did not improve with IV NAC
BISAP	<i>Am J Gastro</i> 2009; 104:966	Five point scoring system for patients with acute pancreatitis to identify those at increased risk for mortality
Early combined vs. conventional management in Crohn's	<i>Lancet</i> 2008; 371:660-7	Initiation of more intensive therapy early in Crohn's disease may be more likely to result in corticosteroid-free remission than conventional therapy
FAMOUS	<i>Lancet</i> 2009; 374:119-25	Famotidine was effective in preventing gastric and duodenal ulcers, and erosive esophagitis in patients receiving low-dose ASA therapy
Glucocorticoids and NAC in Alcoholic Hepatitis	<i>NEJM</i> 2011; 365:1781-9	Combination therapy improved 1 mo survival, but not 6 mo survival compared to prednisolone monotherapy
MELD	<i>Gastroenterology</i> 2003; 124:91-6	MELD score can be applied for allocation of donor livers as it accurately predicts 3 mo mortality in patients with chronic liver failure
SONIC	<i>NEJM</i> 2010; 362:1383-95	In moderate-severe Crohn's disease, infliximab + azathioprine was more likely to result in corticosteroid-free remission than infliximab monotherapy. Infliximab monotherapy was more effective than azathioprine monotherapy

## Acronyms

AAA	abdominal aortic aneurysm
ABG	arterial blood gas
ABI	ankle brachial index
APR	abdomino-perineal resection
BRBPR	bright red blood per rectum
CBD	common bile duct
CVA	costovertebral angle
CVP	central venous pressure
DIC	disseminated intravascular coagulation
DPL	diagnostic peritoneal lavage
EBL	estimated blood loss
OGD/EGD	esophagogastro-duodenoscopy
ERCP	endoscopic retrograde cholangiopancreatography
EUA	examination under anesthesia
EUS	endoscopic ultrasound
FAST	focused abdominal sonogram for trauma
FNA	fine needle aspiration
FOBT	fecal occult blood test
GERD	gastroesophageal reflux disease
HGCG	hereditary diffuse gastric carcinoma
HNPPC	hereditary nonpolyposis colorectal cancer
I&D	incision and drainage
LAR	low anterior resection
LBO	large bowel obstruction
LES	lower esophageal sphincter
LGIB	lower GI bleed
MAE	moving all extremities
MEN	multiple endocrine neoplasia
MIS	minimally invasive surgery
MRCP	magnetic resonance cholangiopancreatography
NGT	nasogastric tube
OGD	oesophagogastroduodenoscopy
POD	postoperative day
PTC	percutaneous transhepatic cholangiography
SBO	small bowel obstruction
SIADH	syndrome of inappropriate anti-diuretic hormone
TED	thrombo embolic deterrent
TEE	transesophageal echocardiogram
TTE	transthoracic echocardiogram
UGIB	upper GI bleed
VATS	video-assisted thorascopic surgery

## Basic Anatomy Review

© Agnes Chan 2012

**Figure 1. Abdominal incisions**

### Layers from Superficial to Deep

- skin (epidermis, dermis, subcutaneous fat)
- superficial fascia
  - Camper's fascia (fatty) → Dartos
  - Scarpa's fascia (membranous) → Colles' superficial perineal fascia
- muscle (see Figure 2 and Figure 3)
  - external oblique → inguinal ligament → external spermatic fascia → fascia lata
  - internal oblique → cremasteric muscle/fascia
  - transversus abdominis → posterior inguinal wall
- transversalis fascia → internal spermatic fascia
- preperitoneal fat
- peritoneum → tunica vaginalis
- at midline
  - rectus abdominis muscle: in rectus sheath, divided by linea alba
- above arcuate line (semicircular line of Douglas), which is midway between symphysis pubis and umbilicus
  - anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
  - posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus muscle aponeurosis
- below arcuate line
  - anterior rectus sheath = aponeurosis of external, internal oblique, transversus muscles
  - posterior rectus sheath = transversalis fascia
- arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle

**Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord**

Figure 3. Midline cross-section of abdominal wall

Figure 4. Blood supply to the GI tract

### Venous Flow

Figure 5. Venous drainage of the GI tract

Organ	Arteries
Liver	Left and right hepatic (branches of hepatic proper)
Spleen	Splenic
Gallbladder	Cystic (off right hepatic artery)
Stomach	1. Lesser curve: right and left gastric 2. Greater curve: right (off gastroduodenal) and left (off splenic) gastroepiploic (i.e. gastro-omental) 3. Fundus: short gastrics (off splenic)
Duodenum	1. Gastroduodenal 2. Pancreaticoduodenals (superior off gastroduodenal, inferior off superior mesenteric)
Pancreas	1. Splenic branches 2. Pancreaticoduodenals
Small intestine	1. Superior mesenteric branches: jejunal, ileal, ileocolic
Large intestine	1. Superior mesenteric branches: right colic, middle colic 2. Inferior mesenteric branches: left colic, sigmoid, rectal

# Differential Diagnoses of Common Presentations

## Acute Abdominal Pain

Table 1. Differential Diagnosis of Acute Abdominal Pain

In all patients presenting with an acute abdomen, order the following:

### KEY TESTS FOR SPECIFIC DIAGNOSIS

- ALP, ALT, AST, bilirubin
- Amylase/lipase
- Urinalysis
- $\beta$ -hCG (in women of childbearing age)
- Troponins
- Lactate

### KEY TESTS FOR OR PREPARATION

- CBC, electrolytes, BUN, creatinine, glucose
- CXR + ECG
- INR/PTT

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate laparotomy.

### Localization of Pain

Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation. Kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain.

### Referred Pain

- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (right paracolic gutter)
- Hip pain: to groin

### Most Common Presentations of Surgical Pain

- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = ischemic bowel
- Vague pain that then localizes = appendicitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction

### Types of Peritonitis

- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

## Abdominal Mass

**Table 2. Differential Diagnosis of Abdominal Mass**

Right Upper Quadrant (RUQ)	Upper Midline	Left Upper Quadrant (LUQ)
<b>Gallbladder:</b> cholecystitis, cholangiocarcinoma, peri-ampullary malignancy, cholelithiasis <b>Biliary tract:</b> Klatskin tumour <b>Liver:</b> hepatomegaly, hepatitis, abscess, tumour (hepatocellular carcinoma, metastatic tumour, etc.)	<b>Pancreas:</b> pancreatic adenocarcinoma, other pancreatic neoplasm, pseudocyst <b>Abdominal aorta:</b> AAA (pulsatile) Gastric tumour (adenocarcinoma, gastrointestinal stromal tumour, carcinoid tumour), MALT lymphoma	<b>Spleen:</b> splenomegaly, tumour, abscess, subcapsular splenic hemorrhage, can also present as RLQ mass if extreme splenomegaly <b>Stomach:</b> tumour
Right Lower Quadrant (RLQ)	Lower Midline	Left Lower Quadrant (LLQ)
<b>Intestine:</b> stool, tumour (CRC), mesenteric adenitis, appendicitis, appendiceal phlegmon or other abscess, typhlitis, intussusception, Crohn's inflammation <b>Ovary:</b> ectopic pregnancy, cyst (physiological vs. pathological), tumour (serous, mucinous, struma ovarii, germ cell, Krukenberg) <b>Fallopian tube:</b> ectopic pregnancy, tubo-ovarian abscess, hydrosalpinx, tumour	<b>Uterus:</b> pregnancy, leiomyoma (fibroid), uterine cancer, pyometra, hematometra <b>GU:</b> bladder distention, tumour	<b>Intestine:</b> stool, tumour, abscess (see RLQ) <b>Ovary:</b> ectopic pregnancy, cyst, tumour (see RLQ) <b>Fallopian tube:</b> ectopic pregnancy, tubo-ovarian abscess, hydrosalpinx, tumour

### Indications for Urgent Operation

#### IHOP

Ischemia  
Hemorrhage  
Obstruction  
Perforation

## GI Bleeding

- see [Gastroenterology](#), G25

### Indications for Surgery

- failure of medical management
- hemodynamic instability despite vigorous resuscitation
- recurrent hemorrhage after initial stabilization procedures with up to two attempts of endoscopic hemostasis
- hypovolemic shock
- prolonged bleeding with transfusion requirement >3 units/d

### Surgical Management of GI Bleeding

- upper GI bleeding:
  - bleeding from a source proximal to the ligament of Treitz
  - often presents with hematemesis and melena unless very brisk (then can present with hematochezia, hypotension, tachycardia)
  - initial management with endoscopy; if fails, then consider surgery
  - note: PUD accounts for approximately 55% of severe UGI bleeding
- lower GI bleeding:
  - bleeding from a source distal to the ligament of Treitz
  - often presents with BRBPR unless proximal to transverse colon
    - ♦ may occasionally present with melena
  - initial management with colonoscopy to detect and potentially stop source of bleeding
  - angiography, RBC scan to determine source as indicated
    - ♦ surgical intervention if no source found – obscure bleed

**Table 3. Differential Diagnosis of GI Bleeding**

Anatomical Source	Etiology	
<b>Hematological</b>	Excess anticoagulation (coumadin, heparin, etc.) Excess antiplatelet (clopidogrel, ASA)	Disseminated intravascular coagulation (DIC) Congenital bleeding disorders
<b>Nose</b>	Epistaxis	
<b>Esophagus</b>	Esophageal varices Mallory-Weiss tear Esophagitis	Aorto-esophageal fistula (generally post endovascular aortic repair)* Esophageal cancer
<b>Stomach</b>	Gastritis Gastric varices Dieulafoy's lesion	Gastric ulcer Gastric cancer*
<b>Duodenum</b>	Duodenal ulcer Perforated duodenal ulcer*	Duodenal cancer*
<b>Jejunum</b>	Tumours* Polyps Ulcers	

**Overt bleeding:** obvious hematochezia or melena per rectum visible to naked eye

**Occult bleeding:** bleeding per rectum is not obvious to naked eye (e.g. positive guaiac test)

**Obscure bleeding:** overt bleeding with no identifiable source after colonoscopy and endoscopy

### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

NEJM 2013;368:11-21

Recent study by Villanueva et. al, demonstrates that a restrictive transfusion strategy significantly improves outcomes in patients with acute upper GI bleeding, compared to a liberal transfusion strategy. Refer to study for details.

**Table 3. Differential Diagnosis of GI Bleeding** (continued)

Anatomical Source	Etiology	
<b>Ileum and Ileocecal Junction</b>	Meckel's diverticulum (rare surgical management)	Crohn's disease*
	Small bowel obstruction	Tuberculosis of ileocecal junction
<b>Large Intestine</b>	Colorectal cancer*	Crohn's disease (less frequently presents with bleeding)*
	Mesenteric thrombosis/ischemic bowel*	Pancolitis (infectious, chemotherapy or radiation induced)
	Ulcerative colitis* (subtotal colectomy if failure of medical management)	Bleeding post-gastrointestinal anastomosis
	Angiodysplasia	
	Diverticula	
<b>Sigmoid</b>	Diverticulosis*	Polyps* (surgical management if not amenable to colonoscopic polypectomy)
	Sigmoid cancer*	Inflammatory bowel disease (IBD)
	Bleeding post-polypectomy	
<b>Rectum and Anus</b>	Hemorrhoids	Polyps* (surgical management if not amenable to polypectomy)
	Fissures	Crohn's or ulcerative colitis*
	Rectal cancer*	Solitary rectal ulcer syndrome
	Anal varices	

\*Managed surgically in most cases

## Jaundice

- see [Gastroenterology](#), G40

**Table 4. Differential Diagnosis of Jaundice**

<b>Pre-hepatic:</b> Pathology prior to the level of the liver Hemolysis Hyperthyroidism Portosystemic shunts Heart failure Large heme load (e.g. large hematoma reabsorption)	<b>Post-hepatic (obstructive):</b> Pathology after the conjugation of bilirubin in the liver
<b>Hepatic:</b> Pathology at the level of the liver Viral hepatitis Alcohol related hepatitis Non-alcohol related steatohepatitis Drug-induced hepatitis Dubin-Johnson syndrome Sepsis and hypoperfusion states TPN Infiltrative diseases (e.g. amyloidosis, lymphoma, sarcoidosis, tuberculosis) Hepatic crisis in sickle cell disease Pregnancy Cirrhosis End-stage liver disease	<b>Intraductal</b> Choledocholithiasis Sclerosing cholangitis Choledochal cyst Benign biliary stricture Cholangiocarcinoma AIDS cholangiopathy Autoimmune cholangiopathy Certain parasitic infections (e.g. <i>Ascaris lumbricoides</i> , liver flukes)  <b>Extraductal</b> Carcinoma: head of pancreas, ampulla of Vater, duodenum Lymphoma Metastases in peri-portal nodes Acute/chronic pancreatitis

### Biochemical Signs for Differentiating Jaundice

**Hepatocellular:** Elevated bilirubin + elevated ALT/AST  
**Cholestatic:** Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary U/S  
**Hemolysis:** ↓ haptoglobin ↑ LDH

**Note:** cholestatic jaundice is usually surgical.

### Bilirubin Levels

	Prehepatic	Intrahepatic	Posthepatic
<b>Serum bilirubin</b>			
Indirect	↑	↑	N
Direct	N	↑	↑
<b>Urine</b>			
Urobilinogen	↑	↑	–
Bilirubin	–	+	+
<b>Fecal</b>			
Urobilinogen	↑	↑	–

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out.

### Best Practice in General Surgery (BPIGS)

<http://www.bpigs.ca/>  
 BPIGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains EBM based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up to date pre-operative and general treatment guidelines.

## Preoperative Preparations

### Considerations

- informed consent (see [Ethical, Legal and Organizational Aspects of Medicine](#), ELOAM5)
- screening questionnaire to assess important potential risk factors such as age, exercise capacity, and medication use
- consults: anesthesia, medicine, cardiology as indicated
- NPO for ≥6 h prior, AAT (activity as tolerated), VSR (vital signs routine)
- IV – balanced crystalloid at maintenance rate (4:2:1 rule → roughly 100-125 cc/h): normal saline or Ringer's lactate; bolus to catch up on estimated losses including losses from bowel prep
  - appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- patient's regular medications including prednisone: consider pre-op stress dose if prednisone with β-blocker used in past year
- prophylactic antibiotics depending on wound class (within 1 h prior to incision): usually cefazolin (Ancef®) ± metronidazole (Flagyl®)
- bowel prep: cleans out bowel and decreases bacterial population
  - oral cathartic (e.g. fleet Phosphosoda®) starting previous day
  - in selected cases; current evidence does not support routine use
- consider DVT prophylaxis for all inpatient surgery (heparin)

- do not hold heparin prior to surgery unless epidural is expected
- hold ASA x 1 wk pre-op
- smoking cessation x 6 wk pre-op can significantly decrease post-op complications

### Investigations

- blood components: group and screen or cross and type depending on procedure
- CBC, electrolytes, BUN, creatinine
- INR/PT, PTT
- ABGs if predisposed to respiratory insufficiency
- CXR (PA and lateral) if >50 yr old or previously abnormal within past 6 mo
- ECG if >50 yr old or as indicated by history
- $\beta$ -HCG testing in all women of reproductive age

### Drains

- nasogastric (NG) tube:
  - indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, feeding (only if necessary due to risk of aspiration → naso-jejunal tube preferable)
  - contraindications: suspected basal skull fracture, obstruction of nasal passages due to trauma
- Foley catheter with urometer:
  - indications: to accurately monitor urine output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
  - contraindications: suspected urethral injury, difficult insertion of catheter

#### Approach to the Critically Ill Surgical/Trauma Patient

##### ABC, I'M FINE ABC

IV: 2 large bore IV's with NS, wide open  
Monitors: O<sub>2</sub> sat, ECG, BP  
Foley catheter to measure urine output  
Investigations: bloodwork  
NG tube if indicated  
"Ex" rays (abdomen 3 views, CXR),  
other imaging – only when stable

#### Pre and Post-Op Orders

##### ADDAVIDS

Admit to ward X under Dr. Y  
Diagnosis  
Diet  
Activity  
Vitals (q4h from ED and post-op is standard)  
IV, Investigations, Ins and Outs  
Drugs, Dressings, Drains  
Special procedures

#### Drugs – 6 As

Analgesia  
Anti-emetic  
Anti-coagulation  
Antibiotics  
Anxiolytics  
All other patient meds (home meds, stress dose steroids and  $\beta$ -blockers)

#### 5 Ws of Post-Op Fever

Wind POD #1-2 (pulmonary – atelectasis, pneumonia)  
Water POD #3-7 (urine – UTI)  
Wound POD #3-7  
Walk POD #8+ (thrombosis – DVT/PE)  
Wonder drugs POD #1+ (drug – fever)

#### Drain Size:

Measured by the unit French:  
French = diameter (mm) x 3

## Surgical Complications

### Postoperative Fever

- fever does not necessarily imply infection particularly in the first 24-48 h post-op
- fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids or immunosuppression
- timing of fever may help identify cause
  - hours after surgery – POD #1 (immediate):
    - ♦ inflammatory reaction in response to trauma from surgery
    - ♦ reaction to blood products received during surgery
    - ♦ malignant hyperthermia
  - POD #1-2 (acute):
    - ♦ atelectasis (most common cause of fever on POD #1)
    - ♦ early wound infection (especially *Clostridium*, Group A *Streptococcus* – feel for crepitus and look for “dishwater” drainage)
    - ♦ aspiration pneumonitis
    - ♦ other: Addisonian crisis, thyroid storm, transfusion reaction
  - POD #3-7 (subacute): infections more likely
    - ♦ UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, leakage at bowel anastomosis (tachycardia, hypotension, oliguria, abdominal pain)
  - POD #8+ (delayed):
    - ♦ intra-abdominal abscess, DVT/PE (can be anytime post-op, most commonly POD #8-10), drug fever
    - ♦ other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, *C. difficile* colitis, endocarditis

### Treatment

- treat primary cause
- antipyrexia (e.g. acetaminophen)

## Wound/Incisional Complications

### WOUND CARE

- can shower POD #2-3 after epithelialization of wound
- dressings can be removed POD #2 and left uncovered if dry
- examine wound if wet dressing, signs of infection (fever, tachycardia, pain)
- skin sutures and staples can be removed POD #7-10:
  - exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, immunosuppressed) removed POD #14, earlier if signs of infection
- negative pressure dressings consist of foam and suction, promote granulation
  - ideal for large (grafted sites) or non-healing wounds (irradiated skin, ulcer)

## DRAINS

- sometimes placed intra-operatively to prevent fluid accumulation (blood, pus, serum, bile, urine)
  - can be used to assess quantity of third space fluid accumulation post-operatively
- potential route of infection, bring out through separate incision (vs. operative wound) to decrease risk of wound infection and remove as soon as possible
- types of drains
  - open (Penrose), higher risk of infection
  - closed (Jackson-Pratt, hemovac) connected to suction
  - pump (Daval) suction with airflow system to prevent obstruction
- monitor drain outputs daily
- drains should be removed once drainage is minimal (usually less than 30-50 cc/24 h)
- evidence does not support routine post-operative drainage of abdominal cavity

## SURGICAL SITE INFECTION

### Etiology

- *S. aureus*, *E. coli*, *Enterococcus*, *Streptococcus* spp., *Clostridium* spp.

### Risk Factors

- type of procedure:
  - clean (elective, not emergent, not traumatic, no acute inflammation, resp/GI/biliary/GU tracts not entered): <1.5%
  - clean-contaminated (elective entering of resp/GI/biliary/GU tracts): <3%
  - contaminated (nonpurulent inflammation, gross spillage from GI, entry into biliary or GU tracts with infected bile/urine, penetrating trauma <4 h old): 5%
  - dirty (purulent inflammation, pre-op perforation of resp/GI/biliary/GU tracts, penetrating trauma >4 h old): ~33-50%
  - increased risk with procedures >2 h long, use of drains
- patient characteristics:
  - age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, chemotherapy
- other factors:
  - prolonged preoperative hospitalization, reduced blood flow, break in sterile technique, multiple antibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, hypothermia

### Clinical Presentation

- typically fever POD #3-6 (*Streptococcus* and *Clostridium* can present in 24 h)
- pain, blanchable wound erythema, induration, frank pus or purulosanguinous discharge, warmth
- complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, hernia

### Prophylaxis

- used to reduce the chance of surgical site infections
  - pre-op antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamycin):
    - within 1 h pre-incision; can re-dose at 1-2 half lives (~q4-8h) in the OR
    - not required for low risk elective cholecystectomy, hemorrhoidectomy, fistulotomy, sphincterotomy for fissure
- generally no need to continue prophylactic antibiotics postoperatively, reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection
- normothermia (maintain patient temperature 36-38°C during OR)
- hyperoxygenation (consider FiO<sub>2</sub> of 80% in OR)
- chlorhexidine-alcohol wash of surgical site
- hair removal should not be performed unless necessary; if so, clipping superior to shaving
- consider delayed primary closure of incision for contaminated wounds

### Treatment

- examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
- re-open affected part of incision, pack, heal by secondary intention
- antibiotics and demarcation of erythema only if cellulitis or immunodeficiency
- debride necrotic and non-viable tissue

#### Prophylactic Anastomotic Drainage for Colorectal Surgery

Cochrane DB Syst Rev 2004;2:CD002100

**Purpose:** To determine if prophylactic anastomotic drainage prevents complications after elective colorectal surgery.

**Methods:** Systematic review and meta-analysis of randomized-controlled trials (RCTs). Main outcome was clinical anastomotic dehiscence. Secondary outcomes were mortality, radiological anastomotic dehiscence, wound infection, reoperation, and extra abdominal complications.

**Results:** 6 RCTs (n = 1140 patients; n = 573 with drains, n = 567 no drains) were included. No statistically significant differences were found between drains and no drains in all outcomes.

**Conclusions:** Insufficient evidence to conclude if routine prophylactic anastomotic drainage prevents complications after colorectal surgery.

#### Systemic Prophylactic Antibiotics Recommendations

Updated Recommendations for Control of Surgical Site Infections

Ann Surg 2011;253:1082-93

- Choice of routine prophylactic antibiotic depends on the pathogen and patient allergies.
- Vancomycin and fluoroquinolones should be administered 1-2 h prior to incision. All other antibiotics should be administered 30 min prior to incision.
- Short-acting antibiotics should be redosed ~3 h after incision.
- Antibiotic administration >24 h after surgery does not appear to add benefits
- Antibiotics should no longer be routinely administered in three doses.
- The majority of antibiotics are renally excreted hence renal function must be considered in antibiotic administration
- Obese patients need higher antibiotic doses to achieve therapeutic concentrations
- Drug half-life and length of operation need to be considered in antibiotic administration

#### Examples of Wound Classification

**Clean:** elective inguinal herniorrhaphy

**Clean-contaminated:** cholecystectomy

**Contaminated:** necrotic bowel resection

**Dirty:** intra-abdominal abscess drainage

## WOUND HEMORRHAGE/HEMATOMA

- secondary to inadequate surgical control of hemostasis

### Risk Factors

- anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial hypertension, severe cough
- more common with transverse incisions through muscle

### Clinical Features

- pain, swelling, discolouration of wound edges, leakage
- rapidly expanding neck hematoma can compromise airway and is a surgical emergency

### Treatment

- pressure dressing
- open drainage ± wound packing (large hematoma only)
- if significant bleeding, may need to re-operate to find source (often do not find a discrete vessel)

## SEROMA

- fluid collection other than pus or blood
- secondary to transection of lymph vessels
- delays healing
- increased infection risk

### Treatment

- pressure dressing ± needle drainage
- if significant may need to re-operate

## WOUND DEHISCENCE

- disruption of fascial layer, abdominal contents contained by skin only
- 95% caused by intact suture tearing through fascia

### Clinical Features

- typically POD #1-3, most common presentation sign is serosanguinous drainage from wound, ± evisceration (disruption of all abdominal layers and extrusion of abdominal contents – mortality of 15%)
- palpation of wound edge: should normally feel a “healing ridge” from abdominal wall closure (raised area of tissue under incision)

### Risk Factors

- local: technical failure of closure, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing
- systemic: smoking, malnutrition (hypoalbuminemia, vitamin C deficiency), connective tissue diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy, obesity, other (e.g. age, sepsis, uremia)
- diabetes mellitus alone is not a risk factor

### Treatment

- place moist dressing over wound with binder around abdomen and transfer to OR
- may consider conservative management with debridement of fascial and/or skin margins
- evisceration is a surgical emergency: take patient for operative closure, use slowly absorbable suture ± retention sutures

#### Preoperative Skin Antiseptics for Preventing Surgical Wound Infections after Clean Surgery *Cochrane DB Syst Rev 2013;3:CD003949*

**Purpose:** To determine if preoperative skin antiseptics prior to clean surgery prevents surgical-site infection (SSI) and which antiseptic is most effective.

**Methods:** Systematic review and meta-analysis of randomized-controlled trials (RCTs). Main outcome was SSI. Secondary outcomes included quality of life, mortality, and length of hospital stay.

**Results:** 13 RCTs (n = 2,623 patients) were included that made 11 total comparisons between skin antiseptics. A single study found a statistically significant difference between two antiseptics: 0.5% chlorhexidine solution in methylated spirits prevented SSIs after clean surgery better than alcohol-based povidone-iodine paint. No other statistically significant differences were found.

**Conclusions:** Insufficient evidence that one antiseptic is better than another. Alcohol-based solutions are probably more effective than aqueous-based solutions.

#### Prospective Randomized Trial of Two Wound Management Strategies for Dirty Abdominal Wounds *Ann Surg 2001;233:409-413*

**Purpose:** To determine the optimal method of wound closure for dirty abdominal wounds.

**Methods:** Patients (n = 51) with dirty abdominal wounds related to perforated appendicitis, other perforated viscus, traumatic injuries >4 h old, or intraabdominal abscesses were included. Patients were randomized to one of two wound management strategies: wound packed with saline-soaked gauze, evaluated 3 d after surgery for closure the next day if appropriate or primary closure. Wounds were considered infected if purulence discharged from the wound, or possibly infected if there were signs of inflammation or serous discharge.

**Results:** The wound infection rate was higher in the primary closure group than in the delayed packed closure group. Lengths of hospital stay and hospital charges were similar between the two groups.

**Conclusion:** Delayed packed closure is appropriate for dirty abdominal wounds with closure on day 4. This resulted in fewer wound infections and no increased duration of admission.

## Urinary and Renal Complications

### URINARY RETENTION

- may occur after any operation with general anesthesia or spinal anesthesia
- more likely in older males with history of benign prostatic hyperplasia, patients on anticholinergics

### Clinical Presentation

- abdominal discomfort, palpable bladder, overflow incontinence, post-void residual urine volume >100 mL

### Treatment

- Foley catheter to rest bladder, then trial of voiding

**OLIGURIA/ANURIA** (see [Nephrology](#), NP33)**Etiology**

- pre-renal vs. renal vs. post-renal:
  - most common post-op cause is pre-renal  $\pm$  ischemic ATN
    - ♦ external fluid loss: hemorrhage, dehydration, diarrhea
    - ♦ internal fluid loss: third-spacing due to bowel obstruction, pancreatitis

**Clinical Presentation**

- urine output  $<0.5$  cc/kg/h, increasing Cr, increasing BUN

**Treatment**

- according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

## Postoperative Dyspnea

- see *Respiratory Complications* below and *Cardiac Complications*, GS11

**Etiology**

- respiratory: atelectasis, pneumonia, pulmonary embolus (PE), acute respiratory distress syndrome (ARDS), asthma, pleural effusion
- cardiac: MI, arrhythmia, CHF
- inadequate pain control

## Respiratory Complications

**ATELECTASIS**

- comprises 90% of post-op pulmonary complications

**Clinical Features**

- low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, tachypnea

**Risk Factors**

- COPD, smoking, obesity, elderly persons
- upper abdominal/thoracic surgery, oversedation, significant post-op pain, poor inspiratory effort

**Treatment**

- pre-operative prophylaxis
  - smoking cessation (best if  $>8$  wk pre-op)
- postoperative prophylaxis
  - incentive spirometry, deep breathing exercise, chest physiotherapy, intermittent positive-pressure breathing
  - selective nasogastric tube decompression after abdominal surgery
  - short-acting neuromuscular blocking agents
  - minimize use of respiratory depressive drug, good pain control, early ambulation

**PNEUMONIA/PNEUMONITIS**

- may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

**Risk Factors**

- aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NG tube, pregnancy, seizure disorder
- non-aspiration: atelectasis, immobility, pre-existing respiratory disease

**Clinical Features**

- productive cough, fever
- tachycardia, cyanosis, respiratory failure, decreased LOC
- CXR: pulmonary infiltrate

**Treatment**

- prophylaxis: see atelectasis prophylaxis, pre-op NPO/NG tube, rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. ceftriaxone, metronidazole)

**PULMONARY EMBOLUS** (see [Respirology](#), R17)**Clinical Features**

- unilateral leg swelling and pain (DVT as a source of PE), sudden onset SOB, tachycardia, fever
- most commonly POD #8-10, but can occur anytime post-op

**Treatment**

- IV heparin, long term warfarin (INR = 2-3) for 3 mo
- Greenfield (IVC) filter if contraindications to anticoagulation
- prophylaxis: subcutaneous heparin (5000 units bid) or LMWH, compression stockings (T.E.D. Hose)

**PULMONARY EDEMA****Etiology**

- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, alveolar injury due to toxins (e.g. ARDS)
  - more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anaesthesia

New onset "asthma" and wheezing in the elderly is cardiogenic until proven otherwise.

**Clinical Features**

- shortness of breath, crackles at lung bases, CXR abnormal

**Treatment (LMNOP)**

- Lasix
- Morphine (decreases symptoms of dyspnea, venodilator and afterload reduction)
- Nitrates (venodilator)
- Oxygen + non-invasive ventilation
- Position (sit patient up)

**RESPIRATORY FAILURE****Clinical Features**

- dyspnea, cyanosis, evidence of obstructive lung disease
- earliest manifestations – tachypnea and hypoxemia (RR >25, pO<sub>2</sub> <60)
- pulmonary edema, unexplained decrease in SaO<sub>2</sub>

**Treatment**

- ABCs, O<sub>2</sub>, ± intubation
- bronchodilators, diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep PaO<sub>2</sub> >60, consider acute respiratory distress syndrome (ARDS)

## Cardiac Complications

- abnormal ECGs common in post-op period (compare to pre-op ECG)
- common arrhythmias: supraventricular tachycardia (SVT), atrial fibrillation (secondary to fluid overload, PE, MI)

**MYOCARDIAL INFARCTION (MI)**

- see [Cardiology and Cardiovascular Surgery](#), C24
- surgery increases risk of MI
- incidence:
  - 0.5% in previously asymptomatic men >50 yr old
  - 40-fold increase in men >50 yr old with previous MI

**Risk Factors**

- pre-op hypertension, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intra-operative hypotension
- operations >3 h
- angina

**Clinical Features**

- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, hypotension

## Intra-abdominal Abscess

### Definition

- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

### Etiology

- usually polymicrobial: Gram-negative bacteria, anaerobes
  - consider Gram-positives if coexisting cellulitis

### Risk Factors

- emergency, contaminated OR
- GI surgery with anastomoses
- poor healing risk factors (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

### Clinical Features

- persistent spiking fever, dull pain, weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison's pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, psoas

### Investigations

- CBC, blood cultures x2
- CT  $\pm$  water-soluble contrast
- DRE (pelvic abscess)

### Treatment

- eradication (preferred), laparoscopy, open drainage
- subsequent antibiotic coverage, ciprofloxacin (Cipro®) + metronidazole (Flagyl®)

## Paralytic Ileus

- see *Bowel Obstruction*, GS24

## Delirium

- see [Psychiatry](#), PS19 and [Neurology](#), N17

## Thoracic Surgery

### Hiatus Hernia

© Jenusha Ellis 2012

Figure 6. Types of hiatus hernia

**SLIDING HIATUS HERNIA (Type I)** (see Figure 6)

- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

**Risk Factors**

- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, heavy lifting)
- smoking

**Clinical Features**

- majority are asymptomatic
- larger hernias frequently associated with GERD due to decreased competence of GE junction

**Complications**

- most common complication is GERD
- other complications are rare and are related to reflux:
  - esophagitis (dysphagia, heartburn)
  - consequences of esophagitis (peptic stricture, Barrett's esophagus, esophageal carcinoma)
  - extra-esophageal complications (pneumonitis/pneumonia, asthma, cough, laryngitis)

**Investigations**

- CXR, barium swallow, endoscopy, or esophageal manometry (technique for measuring LES pressure)
- 24-h esophageal pH monitoring to quantify reflux
- gastroscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett's esophagus and cancer

**Treatment**

- lifestyle modification:
  - stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint and fat
- medical:
  - antacid, H<sub>2</sub>-antagonist, proton pump inhibitor, prokinetic agent
- surgical (<15%):
  - if failure of medical therapy, esophageal stricture, severe nocturnal aspiration, Barrett's esophagus
  - anti-reflux procedure (usually laparoscopic) e.g. Nissen fundoplication
    - ♦ fundus of stomach is wrapped around the lower esophagus and sutured in place
    - ♦ 90% success rate

**PARAESOPHAGEAL HIATUS HERNIA (Type II)** (see Figure 6)

- herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
- least common esophageal hernia (<10%)

**Clinical Features**

- usually asymptomatic due to normal GE junction
- pressure sensation in lower chest, dysphagia

**Complications**

- hemorrhage, incarceration, strangulation, obstruction, gastric stasis ulcer

**Treatment**

- surgery to prevent severe complications:
  - reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
  - may consider suturing stomach to anterior abdominal wall (gastropexy)
  - in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy)

**MIXED HIATUS HERNIA (Type III)**

- combination of Types I and II

**TYPE IV HERNIA**

- herniation of other abdominal organs into thorax: colon, spleen, small bowel

**Differential Diagnosis of Hiatus Hernia**

GI Causes	Non-GI Causes
<ul style="list-style-type: none"> <li>• Cholelithiasis</li> <li>• Diverticulitis</li> <li>• Peptic ulcer</li> <li>• Achalasia</li> <li>• Pancreatitis</li> <li>• GERD</li> <li>• Gastritis</li> </ul>	<ul style="list-style-type: none"> <li>• MI</li> <li>• Angina</li> <li>• Pericarditis</li> </ul>

## Esophageal Perforation

### Etiology

- iatrogenic (most common):
  - endoscopic, dilatation, biopsy, intubation, operative, NG tube placement
- barogenic:
  - trauma
  - repeated, forceful vomiting (Boerhaave's syndrome)
  - other: convulsions, defecation, labour (rare)
- ingestion injury:
  - foreign body, corrosive substance
- carcinoma

### Clinical Features

- neck or chest pain
- fever, tachycardia, hypotension, dyspnea, respiratory compromise
- subcutaneous emphysema, pneumothorax, hematemesis

### Investigations

- CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air
- CT chest: widened mediastinum, pneumomediastinum
- contrast swallow (water-soluble then thin barium): contrast extravasation

### Treatment

- supportive if rupture is contained:
  - NPO, vigorous fluid resuscitation, broad-spectrum antibiotics, possible percutaneous drainage
- surgical:
  - <24 h
    - ♦ primary closure of a healthy esophagus or resection of diseased esophagus
  - >24 h or non-viable wound edges
    - ♦ diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, gastrostomy/jejunostomy for decompression/feeding)

### Complications

- sepsis, abscess, fistula, empyema, mediastinitis, death
- post-op esophageal leak
- mortality 10-50% dependent on timing of diagnosis

**Boerhaave's syndrome:** transmural esophageal perforation

**Mallory-Weiss tear:** non-transmural esophageal tear (partial thickness tear)

Both are associated with forceful emesis.

## Esophageal Carcinoma

### Epidemiology

- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), lower (33-50%)
- main types:
  - most common worldwide: squamous cell carcinoma (SCC) in upper 2/3 of esophagus
  - most common in western countries: adenocarcinoma in distal 1/3 of esophagus

### Risk Factors

- geographic variation in incidence
- SCC:
  - underlying esophageal disease such as strictures, diverticula, achalasia
  - more common in patients from Asia
- adenocarcinoma:
  - Barrett's esophagus (most important), smoking, obesity (increased reflux), GERD

### Clinical Features

- frequently asymptomatic: late presentation
- progressive dysphagia (mechanical): first solids then liquids
- odynophagia then constant pain
- constitutional symptoms
- regurgitation and aspiration (aspiration pneumonia)
- hematemesis, anemia
- tracheoesophageal or bronchoesophageal fistula
- direct, hematogenous or lymphatic spread:
  - trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac and mediastinal nodes

#### 4Ss of SCC

Smoking  
Spirits (alcohol)  
Seeds (betel nut)  
Scalding (hot liquid)

### Investigations

- barium swallow: shows narrowing – suggestive but not diagnostic
- esophagoscopy: biopsy and assess resectability
- endoscopic ultrasound (EUS):
  - visualize local disease
  - regional nodal involvement (most accurate way to stage the cancer)
- bronchoscopy ± thoracoscopy:
  - rule out airway invasion in tumours of the upper and mid esophagus
- CT chest/abdomen
- full metastatic workup (CXR, bone scan, CT-head/CAP, LTFs, etc.)

### Treatment

- if present with distant metastatic disease
  - treat with systemic therapy and treat symptoms (esophageal stent)
- if locally advanced (locally invasive disease or nodal disease on CT or EUS):
  - multimodal therapy:
    - ♦ concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    - ♦ possibility of curative esophagectomy after chemoradiation if disease responds well
  - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation
- if early stage (non-transmural and without evidence of nodal disease):
  - esophagectomy (trans thoracic or trans-hiatal approach) and lymphadenectomy
    - ♦ anastomosis in chest or neck
    - ♦ stomach most often used for reconstruction; may also use colon
  - neoadjuvant chemotherapy and radiation are controversial
  - adjuvant chemotherapy ± radiation usually recommended for post-op node-positive disease

### Prognosis

- prognosis usually poor because presentation is usually at advanced stage

### OTHER DISORDERS

- esophageal varices (see [Gastroenterology](#), G26)
- Mallory-Weiss tear (see [Gastroenterology](#), G27)

## Chest Wall

### CONGENITAL ABNORMALITIES

- pectus excavatum, pectus carinatum, sternal fissures
- surgery for cosmesis, psychosocial factors, respiratory or cardiovascular insufficiency (uncommon)

### THORACIC OUTLET SYNDROME

- impingement of subclavian vessels and brachial plexus nerve trunk

### Etiology

- congenital: cervical rib
- trauma
- degenerative: osteoporosis, arthritis

### Clinical Features

- neurogenic: ulnar and median nerve motor and sensory deficit
- arterial: fatigue, weakness, coldness, ischemic pain, paresthesia
- venous: edema, venous distention, collateral formation, cyanosis

### Treatment

- conservative (50-90%)
  - physiotherapy, posture and behaviour modification
- surgical: if conservative treatment fails, removal of first or cervical rib (if applicable)

### TUMOURS

- benign: fibrous dysplasia, eosinophilic granuloma, osteochondroma
- malignant: fibrosarcoma, chondrosarcoma, osteogenic sarcoma, Ewing's sarcoma, myeloma

**Figure 7. Typical thoracic surgery incisions**

## Pleura, Lung, and Mediastinum

- see [Respirology](#), R20

### Tube Thoracostomy

#### Indications

- to drain abnormal large-volume air or fluid collections in the pleural space
  - hemothorax, chylothorax, empyema
  - pneumothorax, if:
    - ♦ large or progressive
    - ♦ patient is on mechanical ventilation
    - ♦ bronchopleural fistula
    - ♦ tension pneumothorax
- to facilitate pleurodesis:
  - i.e. obliteration of the pleural space by instilling talc or doxycycline to cause fibrosis and adherence of parietal and visceral pleura
  - indicated for recurrent pleural effusions (often malignant)
- for long-term drainage of malignant effusions

#### Complications

- overall complications are rare (1-3%)
- malposition (most common complication), especially by inexperienced operators:
  - tubes may dissect along the external chest wall, or may be placed below the diaphragm
- bleeding (anticoagulation is a relative contraindication)
- local infection, empyema
- perforation of lung parenchyma
- risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)

## Lung Transplantation

#### Conditions Leading to Transplantation

- chronic obstructive pulmonary disease (COPD), emphysema due to  $\alpha$ -1 antitrypsin deficiency
- cystic fibrosis (CF)
- idiopathic interstitial pneumonias: idiopathic pulmonary fibrosis (IPF), nonspecific interstitial pneumonitis
- idiopathic pulmonary arterial hypertension (IPAH), secondary pulmonary hypertension
- Eisenmenger's syndrome
- sarcoidosis, lymphangioleiomyomatosis, pulmonary Langerhan's cell histiocytosis

#### Clinical Indications

- transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
- patients who are symptomatic during activities of daily living and limited expected survival over the next 2 yr

#### Criteria for Transplantation

- lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
- transplant benefit = post-transplant survival (days) – waitlist survival (days)

#### Contraindications

- uncontrolled or untreatable pulmonary or extrapulmonary infection
- malignancy in the last 2 yr
- advanced cardiopulmonary disease
- significant chest wall/spinal deformity
- active cigarette smoking
- HIV infection, ongoing HBV or HCV infections

#### Post-op Complications

- primary graft dysfunction: main cause is ischemia-reperfusion injury, graded by  $\text{PaO}_2/\text{FiO}_2$  ratio and CXR findings
- airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, fistula)
- chronic graft dysfunction: bronchiolitis obliterans syndrome

Figure 8. Tube thoracostomy

- infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, mycobacteria)
- malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi's sarcoma, bladder)

### Prognosis

- median survival for all adult recipients: 5.4 yr
- 1 yr survival: COPD > IPF > IPAHA
- 10 yr survival: CF,  $\alpha$ -1 antitrypsin deficiency > IPAHA > COPD, IPF

## Chronic Obstructive Pulmonary Disease

- see [Respirology](#), R8

### Treatment

- indications for surgical management:
  - dyspnea despite maximal medical therapy and pulmonary rehabilitation
  - CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
  - may be used as a bridging procedure to lung transplantation
- contraindications:
  - age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
  - homogeneously distributed emphysematous changes without areas of preserved lung tissue
  - $DL_{CO}$  <20% of predicted,  $PaCO_2$  >60 mm Hg,  $PaO_2$  <45 mmHg
- surgical procedures:
  - lung volume reduction surgery (LVRS): wedge excision of emphysematous tissue
  - bilateral or unilateral, thoracotomy or VATS

### Complications of Treatment

- air leak: may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

### Prognosis

- total mortality at 2 yr same as with maximal medical therapy, but better exercise capacity and quality of life with LVRS

#### A Randomized Trial Comparing Lung Volume Reduction Surgery with Medical Therapy with Severe Emphysema

NEJM 2003;348:2059-2073

**Purpose:** To describe the outcomes of patients with severe emphysema who received pulmonary rehabilitation and lung-volume-reduction surgery or medical treatment.

**Methods:** Randomization of 1218 patients from 17 clinics to lung-volume-reduction surgery (bilateral stapled wedge resection by median sternotomy or video-assisted thoracic surgery) or continued medical treatment.

**Results:** More patients in the surgery group ( $n = 608$ ) had improved exercise capacity than the medical group ( $n = 610$ ) ( $p < 0.001$ ). After exclusion of patients at high mortality risk, no difference in overall mortality was found between the surgery and medical groups ( $p = 0.31$ ). For patients with predominantly upper-lobe emphysema and low exercise capacity ( $n = 290$ ), there was lower mortality in the surgery vs. medical group ( $p = 0.005$ ) and higher exercise capacity improvement in the surgery group ( $p < 0.001$ ). Mortality was higher in the surgery vs. medical group for patients with non-upper-lobe emphysema and high exercise capacity ( $n = 220$ ) ( $p = 0.02$ ).

**Conclusions:** No overall differences in mortality were found between the lung-volume-reduction surgery vs. medical groups. However, patients receiving surgery had improved exercise capacity. Patients with predominantly upper-lobe emphysema and low exercise capacity may be good candidates for lung-volume-reduction surgery while patients with non-upper-lobe emphysema and high exercise capacity may be poor candidates.

## Stomach and Duodenum

### Peptic Ulcer Disease

#### GASTRIC ULCERS

- see [Gastroenterology](#), G12

#### Indications for Surgery

- unresponsive to medical treatment (intractability):
  - always operate if fails to heal completely, even if biopsy negative: could be primary gastric lymphoma or adenocarcinoma
- dysplasia or carcinoma:
  - always biopsy ulcer for malignancy
- hemorrhage: 3x greater risk of bleeding compared to duodenal ulcers
- complications: obstruction, perforation, bleeding
- surgical treatment is increasingly rare due to *H. pylori* eradication and medical treatment

#### Procedures

- distal gastrectomy with ulcer excision: Billroth I or Billroth II (see Figure 9)
- vagotomy and pyloroplasty only if acid hypersecretion (rare)
- wedge resection if possible or biopsy with primary repair

#### DUODENAL ULCERS

- see [Gastroenterology](#), *Bleeding Peptic Ulcer*, G13 and *Peptic Ulcer Disease*, G12
- most within 2 cm of pylorus (duodenal bulb)

#### Indications for Surgery

- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
  - decision to operate based on amount of blood loss (usually >8 units), rate of bleeding and hemodynamic stability
- intractable despite medical management (endoscopy)

**Kissing ulcer:** combination of perforation and bleeding.

### Procedures

- Graham patch of perforated ulcer-plication of ulcer and omental patch
- oversewing of bleeding ulcer  $\pm$  pyloroplasty
- pyloroplasty, gastroduodenostomy or gastrojejunostomy (improved drainage)
- antrectomy (eliminate hormonal stimulation from the antrum)
- gastric resection (decrease the number of parietal cells)
- vagotomy
  - rarely done now due to *H. pylori* eradication and proton pump inhibitors

### Complications of Surgery

- retained antrum
- fistula (gastrocolic/gastrojejunal)
- dumping syndrome, postvagotomy diarrhea, afferent loop syndrome (see *Complications of Gastric Surgery*, GS20)

**Table 5. Complications of Duodenal Ulceration**

Complication	Clinical Features	Management
<b>Perforated ulcer</b> (typically on anterior surface)	Sudden onset of pain (possibly in RLQ due to track down right paracolic gutter) Acute abdomen: rigid, diffuse guarding Ileus Initial chemical peritonitis followed by bacterial peritonitis	Investigation: CXR – free air under diaphragm (70% of patients)  Treatment: Oversew ulcer (plication) and omental (Graham) patch – most common treatment
<b>Posterior penetration</b>	Elevated amylase/lipase if penetration into pancreas Constant mid-epigastric pain burrowing into back, unrelated to meals	
<b>Hemorrhage</b> (typically on posterior surface)	Gastroduodenal artery involvement	Resuscitation initially with crystalloids; blood transfusion if necessary Diagnostic and/or therapeutic endoscopy (laser, cautery or injection); if recurs, may have second scope Consider interventional radiology: angiography with embolization/coiling Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and IR: oversewing of ulcer, pyloroplasty
<b>Gastric outlet obstruction</b>	Ulcer can lead to edema, fibrosis of pyloric channel, neoplasm Nausea and vomiting (undigested food, non-bilious), dilated stomach, crampy abdominal pain Succussion splash (splashing noise heard with stethoscope over the stomach when patient is shaken) Auscultate gas and fluid movement in obstructed organ	NG decompression and correction of hypochloremic, hypokalemic metabolic alkalosis Medical management initially: high dose PPI therapy Surgical resection if obstruction does not resolve: either Billroth I, pyloroplasty or gastrojejunostomy

**Figure 9. Billroth I and Billroth II with roux-en-y reconstruction (gastrojejunostomy)**

## Gastric Carcinoma

### Epidemiology

- male:female = 3:2
- incidence of adenocarcinoma <10 (U.S.) vs. 60 (Japan, Korea) per 100,000 (incidence highest in Asia and Latin America)
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr

### Risk Factors

- *H. pylori*, causing chronic atrophic gastritis
- hereditary nonpolyposis colorectal cancer (HNPCC), hereditary diffuse gastric carcinoma (HDGC)
- smoking, alcohol, smoked food, nitrosamines
- pernicious anemia associated with achlorhydria and chronic atrophic gastritis
- gastric adenomatous polyps
- previous partial gastrectomy (>10 yr post-gastrectomy)
- hypertrophic gastropathy
- blood type A

## Clinical Features

- clinical suspicion:
  - ulcer fails to heal
  - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious or late onset of symptoms:
  - postprandial abdominal fullness, vague epigastric pain
  - anorexia, weight loss
  - burping, nausea, vomiting, dyspepsia, dysphagia
  - hepatomegaly, epigastric mass (25%)
  - hematemesis, fecal occult blood, melena, iron-deficiency anemia
- metastasis:
  - peritoneum, liver, lung, brain

## Investigations

- OGD and biopsy; EUS to assess preoperative T-stage and N-stage
- chest/abdo/pelvis CT (for metastatic work-up see Table 7)

**Table 6. TNM Classification System for Staging of Gastric Carcinoma (AJCC/IUCC 2010)**

Primary Tumour (T)		Regional Lymph Nodes (N)		Distant Metastasis (M)	
T0	No evidence of primary tumour	NX	Cannot be assessed	M0	No distant metastasis
Tis	Carcinoma in situ	N0	No regional node	M1	Distant metastasis
T1a	Invasion into lamina propria or muscularis mucosae	N1	Metastasis in 1-2 regional nodes		
T1b	Invasion into submucosa	N2	Metastasis in 3-6 regional nodes		
T2	Invasion into muscularis propria	N3a	Metastasis in 7-15 regional nodes		
T3	Penetration of subserosal connective tissue without tissue invasion of visceral peritoneum or adjacent structures	N3b	Metastasis in ≥16 regional nodes		
T4a	Invasion into serosa				
T4b	Invasion into adjacent structures				

## Treatment

- adenocarcinoma:
  - proximal lesions:
    - total gastrectomy and esophagojejunostomy – Roux-en-Y (see Figure 9)
  - distal lesions:
    - distal gastrectomy: wide margins, en bloc removal of omentum and lymph nodes
  - palliation:
    - gastric resection to decrease bleeding and relieve obstruction, enables the patient to eat
    - radiation therapy
    - studies are showing larger role for chemotherapy
- lymphoma:
  - H. pylori* eradication, chemotherapy ± radiation, surgery in limited cases (perforation, bleeding, obstruction)

### Signs of Metastatic Gastric Carcinoma

**Virchow's node:** left supraclavicular node

**Blumer's shelf:** mass in pouch of Douglas

**Krukenberg tumour:** metastases to ovary

**Sister Mary Joseph node:** umbilical metastases

**Irish's node:** left axillary nodes

### Staging and 5-year Survival Rates for Gastric Cancer

Stage	TNM	5-Year Survival
IA	T1N0M0	71%
IB	T2N0M0 T1N1M0	57%
IIA	T3N0M0 T2N1M0 T1T2M0	45%
IIB	T4aN0M0 T3N1M0 T2N2M0 T1N3M0	33%
IIIA	T4aN1M0 T3T2M0 T2N3M0	20%
IIIB	T4bN0M0 T4bN1M0 T4aN2M0 T3N3M0	14%
IIIC	T4bN2M0 T4bN3M0 T4aN3M0	9%
IV	TxNxM1	4%

### Bariatric (Weight Loss) Surgery for Obesity is Considered when Other Treatments have Failed

#### Benefits

- Greater weight loss in patients with BMI >30 at 2 yr
- Reduction in co-morbidities (Type II diabetes, hypertension and medication use)
- Improvement in quality of life at 2 yr (physical function, physical role, general health, vitality and emotional role)

#### Risks

- Complications: leaks, hernias, infection, pulmonary embolism, postoperative mortality
- Side effects specific to type of procedure (i.e. vomiting, dumping syndrome, food intolerance)
- Cholecystitis occurs as a result of rapid weight loss

Cochrane DB Syst Rev 2009;2:CD003641

## Gastrointestinal Stromal Tumour (GIST)

### Epidemiology

- most common mesenchymal neoplasm of GI tract
- derived from interstitial cells of Cajal (cells associated with Auerbach's plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
- 75-80% associated with tyrosine kinase (c-KIT) mutations
- most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
- typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anemia
- often discovered incidentally on CT, laparotomy or endoscopy

### Risk Factors

- Carney's triad: GISTs, paraganglioma, and pulmonary chondroma
- Type IA neurofibromatosis

### Investigations

- pre-operative biopsy: controversial, but useful for indeterminate lesions:
  - not recommended if index of suspicion for GIST is high
  - percutaneous biopsy is NOT recommended due to high friability and risk of peritoneal spread

### Treatment

- surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
- localized GIST
  - surgical resection with preservation of intact pseudocapsule
  - lymphadenectomy NOT recommended, as GISTs rarely metastasize to lymph nodes
  - consider imatinib postop for high-risk GIST (large, >4 cm with significant mitotic activity)
- advanced disease (i.e. metastases to liver and/or peritoneal cavity)
  - chemotherapy with imatinib

### Prognosis

- risk of metastatic potential depends on:
  - tumour size (worse if >10 cm)
  - mitotic activity (worse if >5 mitotic figures or 50/hpf)
  - degree of nuclear pleomorphism
  - location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
- metastases to liver, omentum, peritoneum; nodal metastases rare

## Bariatric Surgery

- weight reduction surgery for morbid obesity
- indications: BMI >40 or BMI >35 with related comorbidity (e.g. DM, CAD, sleep apnea, severe joint disease)
- requires multidisciplinary evaluation and follow-up

### Surgical Options

- malabsorptive/restrictive:
  - laparoscopic Roux-en-Y gastric bypass (most common – see Figure 9)
  - staple off small gastric pouch (restrictive) with Roux-en-Y limb to pouch (malabsorptive) with dumping syndrome physiology
  - most effective, higher complication rates
- restrictive:
  - laparoscopic adjustable gastric banding
    - silicone band around fundus creates pouch, adjustable through port under skin
  - laparoscopic vertical banded gastroplasty
    - vertical stapled small gastric pouch with placement of silastic ring band
- malabsorptive:
  - biliopancreatic diversion with duodenal switch
  - gastrectomy, enteroenterostomy, duodenal division closure and duodenoenterostomy

### Complications

- perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
- obstruction at enteroenterostomy (see *Complications of Gastric Surgery*, below)
- staple line dehiscence
- dumping syndrome
- cholelithiasis due to rapid weight loss (20-30%)
- band abscess (if long-term)

## Complications of Gastric Surgery

- most resolve within 1 yr (see Figure 10)

### Alkaline Reflux Gastritis (see Figure 10A)

- duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
- treatment:
  - medical: H<sub>2</sub>-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
  - surgical: conversion of Billroth I or II to Roux-en-Y

**Figure 10. Complications of gastric surgery**

**Afferent Loop Syndrome** (see Figure 10B)

- accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
- clinical features:
  - early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
- treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

Keep/maintain a very low threshold for laparoscopy in patients with abdominal pain after gastric bypass.

**Dumping Syndrome** (see Figure 10C)

- early – 15 min post-prandial:
  - etiology:
    - ♦ hyperosmotic chyme released into small bowel (fluid accumulation and jejunal distention)
  - clinical features:
    - ♦ post-prandial symptoms
    - ♦ epigastric fullness or pain, emesis, nausea, diarrhea, palpitations, dizziness, tachycardia, diaphoresis
  - treatment:
    - ♦ small multiple low carbohydrate, low fat and high protein meals and avoidance of liquids with meals
    - ♦ last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
- late – 3 h post-prandial:
  - etiology: large glucose load leads to large insulin release and hypoglycemia
  - treatment: small snack 2 h after meals

**Blind-Loop Syndrome** (see Figure 10D)

- bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
- clinical features:
  - anemia/weakness, diarrhea, malnutrition, abdominal pain and hypocalcemia
- treatment: broad-spectrum antibiotics, surgery (conversion to Billroth I)

**Postvagotomy Diarrhea** (see Figure 10E)

- up to 25%
- bile salts in colon inhibit water resorption
- treatment: medical (cholestyramine), surgical (reversed interposition jejunal segment)

## Small Intestine

### Tumours of Small Intestine

**BENIGN TUMOURS**

- 10x more common than malignant
- usually asymptomatic until large
- most common sites: terminal ileum, proximal jejunum
- polyps:
  - adenomas
  - hamartomas
  - familial adenomatous polyposis (FAP) (see *Familial Colon Cancer Syndromes*, GS33)
  - juvenile polyps
- other: leiomyomas, lipomas, hemangiomas

**Malignant Tumours – ACLS**

Adenocarcinoma      Most common  
 Carcinoid  
 Lymphoma  
 Sarcoma              Least common

↓

**Carcinoid Syndrome Symptoms – FDR**

Flushing  
 Diarrhea  
 Right-sided heart failure

**Table 7. Malignant Tumours of the Small Intestine**

	Adenocarcinoma	Carcinoid	Lymphoma	Metastatic
<b>Epidemiology</b>	Usually 50-70 yr old M>F	Increased incidence 50-60 yr old	Highest incidence in 70s M>F Usually non-Hodgkin's lymphoma	Most common site of GI metastases in patients with metastatic melanoma
<b>Risk Factors</b>	FAP, history of colorectal cancer (CRC), HNPCC		Crohn's, celiac disease, autoimmune disease, immunosuppression, radiation therapy, nodular lymphoid hyperplasia	Melanoma, breast, lung, ovary, colon, cervical cancer

Table 7. Malignant Tumours of the Small Intestine (continued)

	Adenocarcinoma	Carcinoid	Lymphoma	Metastatic
<b>Clinical Features</b>	Early metastasis to LNs 80% metastatic at time of operation Abdo pain (common)	Nausea, vomiting, anemia, GI bleeding, jaundice, weight loss (less common) Often slow-growing Usually asymptomatic, incidental finding Obstruction, bleeding, crampy abdominal pain, intussusception Carcinoid syndrome (<10%): • Hot flashes, hypotension, diarrhea, bronchoconstriction, right heart failure • Requires liver involvement: lesion secretes serotonin, kinins and vasoactive peptides directly to systemic circulation (normally inactivated by liver)	Fatigue, weight loss, fever malabsorption, abdo pain, anorexia, vomiting, constipation, mass Rarely – perforation, obstruction, bleeding, intussusception	Obstruction and bleeding
<b>Investigations</b>	CT abdo/pelvis Endoscopy	Most found incidentally at surgery for obstruction or appendectomy Chest thorax/abdo/pelvis Consider small bowel enteroclysis to look for primary Elevated 5-HIAA (breakdown product of serotonin) in urine or increased 5-HT in blood Radiolabelled octreotide or MIBG scans to locate tumour	CT abdo/pelvis	CT abdo/pelvis
<b>Treatment</b>	Surgical resection ± chemotherapy	Surgical resection ± chemotherapy Carcinoid syndrome treated with steroids, histamine, octreotide Metastatic risk 2% if size <1 cm, 90% if >2 cm	Low grade: chemotherapy with cyclophosphamide High grade: surgical resection, radiation Palliative: somatostatin, doxorubicin	Palliation
<b>Prognosis</b>	5-yr survival 25% (if node positive)	5 yr survival 70%; 20% with liver metastases	5-yr survival 40%	Poor
<b>Origin/Location</b>	Usually in proximal small bowel, incidence decreases distally	Classified based on embryological origin (foregut, midgut, hindgut) Originate from gut enterochromaffin cell Appendix 46%, distal ileum 28%, rectum 17%	Usually distal ileum Proximal jejunum in patients with celiac disease	Hematogenous spread from breast, lung, kidney Direct extension from cervix, ovaries, colon
<b>Staging System</b>	TNM	TNM	Ann Arbor	

## Hernia

### Definition

- fascial defect → protrusion of a viscus into an area in which it is not normally contained

### Epidemiology

- M:F = 9:1
- lifetime risk of developing a hernia: males 20-25%, females 2%
- 50% are indirect inguinal hernia, 25% are direct inguinal hernia, 5% are femoral
- most common surgical disease of males

### Risk Factors

- activities which increase intra-abdominal pressure:
  - obesity, chronic cough, pregnancy, constipation, straining on urination or defecation, ascites, heavy lifting
- congenital abnormality (e.g. patent processus vaginalis)
- previous hernia repair

### Clinical Features

- mass of variable size
- tenderness worse at end of day, relieved with supine position or with reduction
- abdominal fullness, vomiting, constipation
- transmits palpable impulse with coughing or straining

### Investigations

- physical examination usually sufficient
- ultrasound ± CT (CT required for obturator hernias, internal abdominal hernias and Spigelian femoral hernias in obese patients)

Figure 11. Normal inguinal anatomy

### Borders of Hesselbach's Triangle

- Lateral: inferior epigastric artery
- Inferior: inguinal ligament
- Medial: lateral margin of rectus sheath

Figure 12. Richter's hernia

## Classification

- complete: hernia sac and contents protrude through defect
- incomplete: partial protrusion through the defect
- internal hernia: sac herniating into or involving intra-abdominal structure
- external hernia: sac protrudes completely through abdominal wall
- strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
  - requires **emergency** repair
- incarcerated hernia: irreducible hernia, not necessarily strangulated
- Richter's hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
  - a strangulated Richter's hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation
- sliding hernia: part of wall of hernia formed by protruding viscus (usually cecum)

## Anatomical Types

- groin (see Tables 8 and 9)
  - indirect and direct inguinal, femoral (see Figure 13)
  - pantaloon: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
- epigastric: defect in linea alba above umbilicus
- incisional: ventral hernia at site of wound closure, may be secondary to wound infection
- other: Littre's (involving Meckel's), Amyand's (containing appendix), lumbar, obturator, parastomal, umbilical, Spigelian (ventral hernia through linea semilunaris)

## Complications

- incarceration: irreducible
- strangulation: irreducible with resulting ischemia
  - small, new hernias more likely to strangulate
  - femoral >> indirect inguinal > direct inguinal
  - intense pain followed by tenderness
  - intestinal obstruction, gangrenous bowel, sepsis
  - surgical emergency
  - **DO NOT** attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous
    - ♦ will cause closed loop SBO – and EMERGENCY

## Treatment

- surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis; if asymptomatic can delay surgery
- repair may be done open or laparoscopic and may use mesh for tension-free closure
- most repairs are now done using tension free techniques – a plug in the hernial defect and a patch over it or patch alone
- observation is acceptable for small asymptomatic inguinal hernias

## Postoperative Complications

- recurrence (15-20%):
  - risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-op functional status (ASA ≥3 – see [Anesthesia](#), A3), associated medical conditions: type II DM, hyperlipidemia, immunosuppression, any comorbid conditions increasing intra-abdominal pressure
  - less common with mesh/"tension-free" repair
- scrotal hematoma (3%):
  - painful scrotal swelling from compromised venous return of testes
  - deep bleeding: may enter retroperitoneal space and not be initially apparent
  - difficulty voiding
- nerve entrapment:
  - ilioinguinal (causes numbness of inner thigh or lateral scrotum)
  - genital branch of genitofemoral (in spermatic cord)
- stenosis/occlusion of femoral vein:
  - acute leg swelling
- ischemic colitis

### Watchful Waiting vs. Repair of Inguinal Hernia in Minimally Symptomatic Men: A Randomized Clinical Trial

JAMA 2006;295:285-292

**Purpose:** To compare pain and the physical component score (PCS) of the Short Form-36 Version 2 survey at 2 yr in men with minimally symptomatic inguinal hernias treated with watchful waiting or surgical repair.

**Methods:** RCT of 720 men (n=364 watchful waiting, n=356 surgical repair) followed up for 2-4.5 yr. Watchful-waiting patients were followed up at 6 mo and annually and watched for hernia symptoms; repair patients received standard open tension-free repair and were followed up at 3 and 6 mo and annually. The main outcome was pain and discomfort interfering with usual activities at 2 yr and change in PCS from baseline to 2 yr. Secondary outcomes were complications, patient-reported pain, functional status, activity levels, and satisfaction with care.

**Results:** Primary intention-to-treat outcomes were similar at 2 yr for watchful waiting vs. surgical repair: pain limiting activities (5.1% vs. 2.2%, respectively; P = .06 [corrected]); PCS (improvement over baseline, 0.29 points vs. 0.13 points; P = .79). Twenty-three percent of patients assigned to watchful waiting crossed over to receive surgical repair (increase in hernia-related pain was the most common reason offered); 17% assigned to receive repair crossed over to watchful waiting. Self-reported pain in watchful-waiting patients crossing over improved after repair. Occurrence of postoperative hernia-related complications was similar in patients who received repair as assigned and in watchful-waiting patients who crossed over. One watchful-waiting patient (0.3%) experienced acute hernia incarceration without strangulation within 2 yr; a second had acute incarceration with bowel obstruction at 4 yr, with a frequency of 1.8/1000 patient/yr inclusive of patients followed up for as long as 4.5 yr.

**Conclusion:** Watchful waiting is an acceptable option for men with minimally symptomatic inguinal hernias. Delaying surgical repair until symptoms increase is safe because acute hernia incarcerations occur rarely.

### Inguinal Hernias – MD's don't Lie

MD: Medial to the inferior epigastric a.  
= Direct inguinal hernia  
LI: Lateral to the inferior epigastric a.  
= Indirect inguinal hernia

**Inguinal canal walls = MALT x 2**  
(starting superior, moving around posterior)

Roof	<b>2M</b>	2 muscles
Ant. wall	<b>2A</b>	2 aponeuroses
Floor	<b>2L</b>	2 ligaments
Post. wall	<b>2T</b>	2 tendons

Cooper's Ligament, which runs on the pectineal line of the pubic bone, is often exploited in hernia repair.

### Contents of Spermatic Cord

vas deferens, testicular artery/veins, genital branch of genitofemoral nerve, lymphatics, cremaster muscle, ± hernia sac

## Groin Hernias

Table 8. Groin Hernias

	Direct Inguinal	Indirect Inguinal	Femoral
<b>Epidemiology</b>	1% of all men	Most common hernia in men and women Males > females	Affects mostly females
<b>Etiology</b>	Acquired weakness of transversalis fascia "Wear and tear" Increased intra-abdominal pressure	Congenital persistence of processus vaginalis in 20% of adults	Pregnancy – weakness of pelvic floor musculature Increased intra-abdominal pressure
<b>Anatomy</b>	Through Hesselbach's triangle <b>Medial</b> to inferior epigastric artery Usually does not descend into scrotal sac	Originates in deep inguinal ring <b>Lateral</b> to inferior epigastric artery Often descends into scrotal sac (or labia majora)	Into femoral canal, below inguinal ligament but may override it Medial to femoral vein within femoral canal
<b>Treatment</b>	Surgical repair	Surgical repair	Surgical repair
<b>Prognosis</b>	3-4% risk of recurrence	<1% risk of recurrence	

Table 9. Superficial Inguinal Ring vs. Deep Inguinal Ring

Superficial Inguinal Ring	Deep Inguinal Ring
Opening in external abdominal aponeurosis; palpable superior and lateral to pubic tubercle	Opening in transversalis fascia: palpable superior to mid-inguinal ligament
Medial border: medial crus of external abdominal aponeurosis	Medial border: inferior epigastric vessels
Lateral border: lateral crus of external oblique aponeurosis	Superior-lateral border: internal oblique and transversus abdominis muscles
Roof: intercrural fibres	Inferior border: inguinal ligament

## Bowel Obstruction

### Definition

- partial or complete blockage of the bowel resulting in failure of intestinal contents to pass through lumen

### Pathogenesis

- disruption of the normal flow of intestinal contents → proximal dilatation + distal decompression
- may take 12-24 h to decompress, therefore passage of feces and flatus may occur after the onset of obstruction
- bowel ischemia may occur if blood supply is strangulated or bowel wall inflammation leads to venous congestion
- bowel wall edema and disruption of normal bowel absorptive function → increased intraluminal fluid → transudative fluid loss into peritoneal cavity, electrolyte disturbances

### Differential Diagnosis

- small bowel obstruction (SBO), large bowel obstruction (LBO), pseudo-obstruction

### Clinical Features

- must differentiate between obstruction and ileus, and characterize obstruction as acute vs. chronic, partial vs. complete (constipation vs. obstipation), small vs. large bowel, strangulating vs. non-strangulating, and with vs. without perforation

Table 10. Bowel Obstruction vs. Paralytic Ileus

	SBO	LBO	Paralytic Ileus
<b>Nausea, Vomiting</b>	Early, may be bilious	Late, may be feculent	Present
<b>Abdominal Pain</b>	Colicky	Colicky	Minimal or absent
<b>Abdominal Distention</b>	+ (prox SBO), ++ (distal SBO)	++	+
<b>Constipation</b>	+	+	+
<b>Other</b>	± visible peristalsis	± visible peristalsis	
<b>Bowel Sounds</b>	Normal, increased Absent if secondary ileus	Normal, increased (borborygmi) Absent if secondary ileus	Decreased, absent
<b>AXR Findings</b>	Air-fluid levels "Ladder" pattern (plicae circularis) Proximal distention (>3 cm) + no colonic gas	Air-fluid levels "Picture frame" appearance Proximal distention + distal decompression No small bowel air if competent ileocecal valve Coffee bean sign	Air throughout small bowel and colon

Figure 13. Schematic of inguinal (direct and indirect) and femoral hernias

### Complications (of total obstruction)

- strangulating obstruction (10% of bowel obstructions) = **surgical emergency**:
  - cramping pain turns to continuous ache, hematemesis, melena (if infarction)
  - fever, leukocytosis, tachycardia
  - peritoneal signs, early shock
  - see *Intestinal Ischemia*, GS28
- other:
  - perforation: secondary to ischemia and luminal distention
  - septicemia
  - hypovolemia (due to third spacing)

### Investigations

- radiological:
  - upright CXR or left lateral decubitus (LLD) to rule out free air, usually seen under the right hemidiaphragm
  - abdominal x-ray (3 views) to determine SBO vs. LBO vs. ileus (see Table 10)
    - ♦ if ischemic bowel look for: free air, pneumatosis, thickened bowel wall, air in portal vein, dilated small and large bowels, thickened or hose-like haustra (normally finger-like projections)
  - other:
    - ♦ most used: CT provides information on level of obstruction, severity, cause
      - important to r/o closed loop obstruction, especially in the elderly
    - ♦ less used: upper GI series/small bowel series for SBO (if no cause apparent, i.e. no hernias, no previous surgeries)
    - ♦ if suspect LBO, consider a rectal water-soluble (Gastrografin® for PO/PR; Hypaque® for IV) enema rather than barium enema (can thicken and cause complete obstruction)
    - ♦ may consider ultrasound or MRI in pregnant patients
- laboratory:
  - may be normal early in disease course
  - BUN, creatinine, hematocrit (hemoconcentration) to assess degree of dehydration
  - fluid, electrolyte abnormalities
  - amylase elevated
  - metabolic alkalosis due to frequent emesis
  - if strangulation: leukocytosis with left shift, lactic acidosis, elevated LDH (late signs)

### Treatment

- stabilize vitals, fluid and electrolyte resuscitation (with normal saline/Ringer's first, then with added potassium after fluid deficits are corrected)
- NG tube to relieve vomiting, prevent aspiration and decompress small bowel by prevention of further distention by swallowed air
- Foley catheter to monitor in/outs

#### MUST DO

Rule out CRC in constipated patient  
Send for TURP in patient with BPH (treat intra-abdominal hypertension)

#### Increased Risk of Perforation with Distention as seen on Abdo Imaging

- Small bowel  $\geq 3$  cm
- Distal colon  $\geq 6$  cm
- Proximal colon  $\geq 9$  cm
- Cecum  $\geq 12$  cm

Patients presenting with a SBO in setting of "virgin" abdomen should have surgery ASAP – EXCEPTION: malignant obstruction from history and imaging.

## Small Bowel Obstruction (SBO)

### Etiology

Table 11. Common Causes of SBO

Intraluminal	Intramural	Extramural
Intussusception Gallstones	Crohn's Radiation stricture Adenocarcinoma	Adhesions Incarcerated hernia Peritoneal carcinomatosis

### Treatment

- consider whether complete or partial obstruction, ongoing or impending strangulation, location and cause:
  - SBO with history of abdo/pelvic surgery → conservative management (likely to resolve) → surgery if no resolution in 48-72 h or complications
  - complete SBO, strangulation → urgent surgery after stabilizing patient with fluid resuscitation
  - SBO with no previous surgery and no evidence of carcinomatosis → operate
  - trial of medical management may be indicated in Crohn's, recurrent SBO, carcinomatosis
    - ♦ NGT decompression, GI rest, serial abdominal exams
  - special case: early postoperative SBO (within 30 d of abdominal surgery) – prolonged trial of conservative therapy may be appropriate, surgery is reserved for complications such as strangulation

### Prognosis

- mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

In a non-virgin abdomen – adhesional SBOs resolve spontaneously with NG decompression 70% of time.

#### Top 3 Causes of SBO (in order)

**ABC**  
Adhesions  
Bulge (hernias)  
Cancer (neoplasms)

#### Causes of SBO

**SHAVING**  
Stricture  
Hernia  
Adhesions  
Volvulus  
Intussusception/IBD  
Neoplasm  
Gallstones

Never let the sun rise or set on a small bowel obstruction.

## Large Bowel Obstruction (LBO)

### Etiology

Table 12. Common Causes of LBO

Intraluminal	Intramural	Extramural
Constipation	Adenocarcinoma Diverticulitis IBD stricture Radiation stricture	Volvulus Adhesions

### Clinical Features (unique to LBO)

- open loop (10-20%) (safer):
  - incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical presentation similar to SBO
- closed loop (80-90%) (dangerous):
  - competent ileocecal valve, resulting in proximal and distal occlusions
  - massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

### Treatment

- surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
- volvulus requires sigmoidoscopic or endoscopic decompression followed by operative reduction if unsuccessful
  - if successful, consider sigmoid resection on same admission
- cecal volvulus can be a true volvulus or a cecal 'bascule' – both need surgical treatment

### Prognosis

- overall mortality: 10%
- cecal perforation + feculent peritonitis: 20% mortality

#### Top 3 Causes of LBO (in order)

- Cancer
- Diverticulitis
- Volvulus

In a patient with clinical LBO consider impending perforation when:

- Cecum  $\geq 12$  cm in diameter
- Tenderness present over cecum

## Colonic Pseudo-Obstruction

- aka paralytic ileus of large bowel

### Definition

- condition with symptoms of intestinal blockage without any physical signs of blockage

### Differential Diagnosis

- acute: toxic megacolon, trauma, postoperative (especially post orthopedic procedures with prolonged immobilization), neurologic disease, retroperitoneal disease, medications (narcotics, psychiatric)
- chronic: neurologic disease (enteric, central, peripheral nervous system), scleroderma

## Toxic Megacolon

### Pathogenesis

- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

### Etiology

- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (*C. difficile*, *Salmonella*, *Shigella*, *Campylobacter*), viral (cytomegalovirus), parasitic (*E. histolytica*)
- volvulus, diverticulitis, ischemic colitis, obstructing colon cancer are rare causes

### Clinical Features

- infectious colitis usually present for >1 wk before colonic dilatation
- diarrhea  $\pm$  blood (but improvement of diarrhea may portend onset of megacolon)
- abdominal distention, tenderness,  $\pm$  local/general peritoneal signs (suggest perforation)
- triggers: hypokalemia, constipating agents (opioids, antidiarrheals, loperamide, anticholinergics), barium enema, colonoscopy

Colon is MEGA and patient is TOXIC.

**Diagnostic Criteria**

- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- **three of:** fever, HR >120, WBC >10.5, anemia
- **one of:** fluid and electrolyte disturbances, hypotension, altered LOC

**Investigations**

- CBC (leukocytosis with left shift, anemia from bloody diarrhea), electrolytes, elevated CRP, ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

**Treatment**

- NPO, NG tube, stop constipating agents, correct fluid and electrolyte abnormalities, transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis, anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD, metronidazole for *C. difficile*)
- indications for surgery (50% improve on medical management):
  - worsening or persisting toxicity or dilation after 48-72 h
  - severe hemorrhage, perforation
  - high lactate and WBC especially for *C. difficile*
- procedure: subtotal colectomy + end ileostomy (may be temporary, with second operation for re-anastomosis later)

Use caution when giving antidiarrheals, especially with bloody diarrhea.

**Prognosis**

- average 25-30% mortality

## Paralytic Ileus

**Pathogenesis**

- temporary paralysis of the myenteric plexus

**Associations**

- postoperative, intra-abdominal sepsis, medications (opiates, anesthetics, psychotropics), electrolyte disturbances ( $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{2+}$ ), *C. difficile*, inactivity

**Treatment**

- NG decompression, NPO, fluid resuscitation, correct causative abnormalities (e.g. sepsis, medications, electrolytes), consider TPN for prolonged ileus
- post-op: gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
- current interest in novel therapies such as gum chewing and pharmacologic therapy (opioid antagonists)

## Ogilvie's Syndrome

- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- arises in bedridden patients with serious extraintestinal illness or trauma
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel
- first presents with abdominal distention (>90%) ± tenderness
- later symptoms mimic true obstruction

**Associations**

- most common: trauma, infection, cardiac (MI, CHF)
- disability (long term debilitation, chronic disease, bed-bound nursing home patients, paraplegia), drugs (narcotic use, laxative abuse, polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, diffuse carcinomatosis)

**Investigations**

- AXR: cecal dilatation – if diameter  $\geq 12$  cm, increased risk of perforation

**Treatment**

- treat underlying cause
- NPO, NG tube
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia or failure of conservative management

**Prognosis**

- most resolve with conservative management

# Intestinal Ischemia

## Etiology

- acute:
  - arterio-occlusive mesenteric ischemia (AOMI)
    - ♦ thrombotic, embolic, extrinsic compression (e.g. strangulating hernia)
  - non-occlusive mesenteric ischemia (NOMI)
    - ♦ mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
  - mesenteric venous thrombosis (MVT)
    - ♦ consider hypercoagulable state (i.e. rule out malignancy), DVT (prevents venous outflow)
- chronic: usually due to atherosclerotic disease – look for CVD risk factors

## Clinical Features

- acute: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, sepsis
- chronic: postprandial pain, fear of eating, weight loss
- common sites: superior mesenteric artery (SMA) supplied territory, “watershed” areas of colon – splenic flexure, left colon, sigmoid colon

## Investigations

- laboratory: leukocytosis (non-specific), lactic acidosis (late finding)
  - amylase, LDH, CK, ALP can be used to observe progress
  - hypercoagulability workup if suspect venous thrombosis
- AXR: portal venous gas, intestinal pneumatosis, free air if perforation
- contrast CT: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, pneumatosis
- CT angiography is the gold standard for acute arterial ischemia

## Treatment

- fluid resuscitation, correct metabolic acidosis, NPO, NG decompression of stomach, prophylactic broad-spectrum antibiotics, avoid vasoconstrictors and digitalis
- exploratory laparotomy
- angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, percutaneous transluminal angioplasty ± stent
- segmental resection of necrotic intestine:
  - assess extent of viability; if extent of bowel viability is uncertain, a second look laparotomy 12-24 h later is mandatory

Pain “out of keeping with physical findings” is the hallmark of early intestinal ischemia.

An acute abdomen + metabolic acidosis is bowel ischemia until proven otherwise.

Figure 14. Appendix anatomy

## Modified Alvarado Score for Acute Appendicitis

- 1 point per:
  - Migratory right iliac fossa pain (1 point)
  - Anorexia (1 point)
  - Nausea/vomiting (1 point)
  - Tenderness in right iliac fossa (2 points)
  - Rebound tenderness in right iliac fossa (1 point)
  - Fever  $>37.5^{\circ}\text{C}$  (1 point)
  - Leukocytosis (2 points)
- 0-3 = low risk, discharge to return if no improvement
- 4-6 = moderate risk, admit, observe, repeat examinations
- Male 7-9 = appendectomy
- Female (not pregnant) 7-9 = diagnostic laparoscopy ± appendectomy

## McBurney's Sign

Tenderness 1/3 the distance from the ASIS to the umbilicus on the right side.

## Laparoscopic vs. Open Appendectomy

### Laparoscopic Surgery

- Wound infection less likely
- Intra-abdominal abscesses 2 times more likely
- Reduced pain on POD #1
- Reduced hospital stay by 1.1 d
- Sooner return to normal activity, work and sport
- Costs outside hospital are reduced

### Open Surgery

- Shorter duration of surgery
- Lower operation costs

### Overview

Diagnostic laparoscopy and laparoscopic appendectomy appear to be advantageous over open appendectomy, particularly for young female patients and obese patients.

Cochrane DB Syst Rev 2010;10:CD001546

# Appendix

## Appendicitis

## Epidemiology

- 6% of population, M>F
- 80% between 5-35 yr of age

## Pathogenesis

- luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
- etiology:
  - children or young adult: hyperplasia of lymphoid follicles, initiated by infection
  - adult: fibrosis/stricture, fecolith, obstructing neoplasm
  - other causes: parasites, foreign body

## Clinical Features

- most reliable feature is progression of signs and symptoms
- low grade fever ( $38^{\circ}\text{C}$ ), rises if perforation
- abdominal pain then anorexia, nausea and vomiting
- classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney's point
  - due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
  - McBurney's sign

- signs:
  - inferior appendix: McBurney's sign (see GS28), Rovsing's sign (palpation pressure to left abdomen causes McBurney's point tenderness)
  - retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
  - pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)
- complications:
  - perforation (especially if >24 h duration)
  - abscess, phlegmon

### Investigations

- laboratory:
  - mild leukocytosis with left shift (may have normal WBC counts)
  - higher leukocyte count with perforation
  - $\beta$ -hCG to rule out ectopic pregnancy
  - urinalysis
- imaging:
  - upright CXR, AXR: usually nonspecific – free air if perforated (rarely), calcified fecolith, loss of psoas shadow, RLQ ileus
  - ultrasound: may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but CANNOT rule out appendicitis (if >6 mm, SENS/SPEC/ NPV/PPV 98%)
  - CT scan: thick wall, appendicolith, inflammatory changes – overall accuracy 94-100%, optimal investigation

### Treatment

- hydrate, correct electrolyte abnormalities
- surgery (gold standard, 20% mortality with perforation especially in elderly) + antibiotic coverage
- if localized abscess (palpable mass or large phlegmon on imaging and often pain >4-5 d), consider radiologic drainage + antibiotics x 14 d  $\pm$  interval appendectomy in 6 wk (controversial)
- appendectomy:
  - laparoscopic vs. open (see sidebar)
  - complications: spillage of bowel contents, pelvic abscess, enterocutaneous fistula
  - perioperative antibiotics:
    - ♦ cefazolin + metronidazole (no post-op antibiotic unless perforated)
    - ♦ other choices: 2nd/3rd generation cephalosporin for aerobic gut organisms
- colonoscopy in the elderly to rule out other etiology (neoplasm)

### Prognosis

- mortality rate: 0.08% (non-perforated), 0.5% (perforated appendicitis)

#### Effect of Delay to Operation on Outcomes in Adults with Acute Appendicitis

*Arch Surg* 2010;145:886-892

**Purpose:** To examine the effect of delay to appendectomy on morbidity and mortality among adults with appendicitis.

**Method:** Retrospective cohort study with the main exposure being time to operation, and main outcomes being 30-d overall morbidity and serious morbidity/mortality.

**Results:** Of 32,782 patients in the study, 75.2%, 15.1%, and 9.8% underwent surgeries within 6 h, 6-12 h, and >12 h of admission, respectively. Differences in operative duration and length of postoperative stay were statistically significant but not clinically meaningful. No significant differences were observed in adjusted overall morbidity or serious morbidity/mortality. Duration from surgical admission to anesthesia induction was not predictive in regression models for either outcomes.

**Conclusions:** Delay of appendectomy for acute appendicitis among adults does not adversely affect outcomes.

#### Antibiotics versus Placebo for Prevention of Postoperative Infection after Appendectomy

*Cochrane DB Syst Rev* 2005;3:CD001439

**Purpose:** To determine the effectiveness of antibiotics against postoperative infections after appendectomy.

**Method:** Meta-analysis of randomized controlled trials (RCTs) and controlled clinical trials (CCTs), on both adults and children, in which any antibiotic regime was compared to placebo in patients undergoing appendectomy for suspected appendicitis. The main outcomes of interest were wound infection, intra abdominal abscess, length of hospital stay, and mortality.

**Results:** 45 studies (n = 9576) were included. Treatment with antibiotics decreased wound infection and abscess rates.

**Conclusion:** Various prophylactic antibiotic regimens are effective in preventing postoperative complications after appendectomy.

## Tumours of the Appendix

### CARCINOID TUMOURS (most common type)

- see *Tumours of Small Intestines: Carcinoid section*, GS21

### ADENOCARCINOMA

- 50% present as acute appendicitis
- spreads rapidly to lymph nodes, ovaries, and peritoneal surfaces
- treatment: right hemicolectomy

### OTHER

- malignant mucinous cystadenocarcinoma

## Inflammatory Bowel Disease (IBD)

- see *Gastroenterology*, G19

### Principles of Surgical Management

- can alleviate symptoms, address complications, improve quality of life
- conserve bowel: resect as little as possible to avoid short gut syndrome
- perioperative management:
  - optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
  - hold immunosuppressive therapy pre-op, provide pre-op stress dose of corticosteroid if patient had recent steroid therapy, taper steroids post-op
  - DVT prophylaxis: heparin (IBD patients at increased risk of thromboembolic events)

## Crohn's Disease

- see [Gastroenterology](#), G20

### Treatment

- surgery is NOT curative, but over lifetime ~70% of Crohn's patients will have surgery
- indications for surgical management:
  - failure of medical management
  - SBO (due to stricture/inflammation): indication in 50% of surgical cases
  - abscess, fistula (enterocolic, vesicular, vaginal, cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), perianal disease
- surgical procedures:
  - resection and anastomosis/stoma if active or subacute inflammation, perforation, fistula
    - ♦ resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
  - stricturoplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

### Complications of Treatment

- short gut syndrome (diarrhea, steatorrhea, malnutrition)
- fistulas
- gallstones (if terminal ileum resected, decreased bile salt resorption → increased cholesterol precipitation)
- kidney stones (loss of calcium in diarrhea → increased oxalate absorption and hyperoxaluria → stones)

### Prognosis

- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), stricturoplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr

#### Crohn's 3 Major Patterns

- Ileocecal 40% (RLQ pain, fever, weight loss)
- Small intestine 30% (especially terminal ileum)
- Colon 25% (diarrhea)

#### Findings in Crohn's

- "Cobblestoning" on mucosal surface due to edema and linear ulcerations
- "Skip lesions": normal mucosa in between
- "Creeping fat": mesentery infiltrated by fat
- Granulomas: 25-30%
- Barium enema: "lead-pipe appearance"

## Ulcerative Colitis

- see [Gastroenterology](#), G22

### Treatment

- indications for surgical management:
  - failure of medical management (including inability to taper steroids)
  - complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
  - reduce cancer risk (1-2% risk per year after 10 yr of disease)
- surgical procedures:
  - proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
  - proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
  - colectomy and IPAA ± rectal mucosectomy
  - in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

### Complications of Treatment

- early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomotic leak
- late: stricture, anal fistula/abscess, pouchitis, poor anorectal function, reduced fertility

### Prognosis

- mortality: 5% over 10 yr
- total proctocolectomy will completely eliminate risk of cancer
- perforation of the colon is the leading cause of death from ulcerative colitis

#### Findings in Ulcerative Colitis

- Patients usually present with diarrhea (± blood in their stool)
- Associated symptoms include colicky abdominal pain, urgency, tenesmus and incontinence
- Presence of extraintestinal manifestations
- Endoscopically, there is loss of ascaral markings, erythema, granularity of mucosa, petechiae, exudates, edema, erosions, and spontaneous bleeding
- Biopsy features included crypt abscesses, crypt branching, shortening and disarray, and crypt atrophy
- Inflammation is continuous, and usually involves rectum

Both ulcerative colitis and Crohn's disease present with an increased risk of colorectal cancer.

## Diverticular Disease

### Definitions

- diverticulum: abnormal sac-like protrusion from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided

Figure 15. Diverticular disease – cross-sections of true and false diverticuli

## Diverticulosis

### Epidemiology

- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

### Pathogenesis

- risk factors:
  - lifestyle: low-fibre diet (predispose to motility abnormalities and higher intraluminal pressure) inactivity, obesity
  - muscle wall weakness from aging and illness (e.g. Ehler-Danlos, Marfan's)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

### Clinical Features

- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications:
  - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
  - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive lower GI bleeds
  - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, abdominal pain

### Treatment

- uncomplicated diverticulosis: high fibre, education
- diverticular bleed:
  - initially work up and treat as any lower GI bleed
  - if hemorrhage does not stop, resect involved region

## Diverticulitis

### Epidemiology

- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

### Pathogenesis

- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula or obstruction can ensue
- poor containment results in free perforation and peritonitis

#### Diverticulosis vs. Diverticulitis

Diverticulosis represents the presence of diverticuli (bulging pouches) within the colonic wall, whereas diverticulitis is the inflammation of one or more diverticuli.

### Clinical Features

- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, nausea, vomiting, urinary symptoms (with adjacent inflammation)
- complications (25% of cases):
  - abscess: palpable tender abdominal mass
  - fistula: colovesical (most common), coloenteric, colovaginal, colocutaneous
  - colonic obstruction: due to scarring from repeated inflammation
  - perforation: generalized peritonitis (feculent vs. purulent)
    - ♦ recurrent attacks rarely lead to peritonitis
- low-grade fever, mild leukocytosis common,
- occult or gross blood in stool rarely coexist with acute diverticulitis

### Investigations

- AXR, upright CXR:
  - localized diverticulitis (ileus, thickened wall, SBO, partial colonic obstruction)
  - free air may be seen in 30% with perforation and generalized peritonitis
- CT scan (test of choice): very useful for assessment of severity and prognosis
  - 97% sensitive, 99% specific
  - increased soft tissue density within pericolic fat secondary to inflammation, diverticula secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), fistula
  - 10% of diverticulitis cannot be distinguished from carcinoma
- Hypaque® (water soluble) enema – safe (under low pressure):
  - saw-tooth pattern (colonic spasm)
  - may show site of perforation, abscess cavities or sinus tracts, fistulas
- elective evaluations: establish extent of disease and rule out other diagnoses (polyps, malignancy) after resolution of acute episode
  - colonoscopy or barium enema and flexible sigmoidoscopy

### Treatment

- uncomplicated: conservative management
- outpatient: clear fluids only until improvement and antibiotics (e.g. ciprofloxacin and metronidazole) 7-10 d to cover gram negative rods and anaerobes (e.g. *B. fragilis*)
- hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, fail to improve outpatient management
- treat with NPO, IVF, IV antibiotics (e.g. IV ceftriaxone + metronidazole, ampicillin, gentamicin)
- indications for surgery:
  - unstable patient with peritonitis
  - Hinchey stage 3-4 (see Table 13)
  - after 1 attack if: (a) immunosuppressed, (b) abscess needing percutaneous drainage
  - consider after 2 or more attacks, recent trend is toward conservative management of recurrent mild/moderate attacks
  - complications: generalized peritonitis, free air, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
- surgical procedures:
  - for emergency or complex cases: Hartmann procedure: colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo (see Figure 16)
  - elective cases or minimal contamination of the abdominal cavity: consider colon resection + primary anastomosis

### Prognosis

- mortality rates: 6% for purulent peritonitis, 35% for fecal peritonitis
- recurrence rates: 13-30% after first attack, 30-50% after second attack

**Table 13. Hinchey Staging and Treatment for Diverticulitis**

Hinchey Stage	Description	Acute treatment
1	Phlegmon/small pericolic abscess	Medical
2	Large abscess/fistula	Abscess drainage, resection ± primary anastomosis
3	Purulent peritonitis (ruptured abscess)	Hartmann procedure
4	Feculent peritonitis	Hartmann procedure

**Figure 16. Hartmann procedure**

# Colorectal Neoplasms

## Colorectal Polyps

### Definition

- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk) (see Figure 17)

### Epidemiology

- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70

### Clinical Features

- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, mucus
- usually detected during routine endoscopy or familial/high risk screening

### Pathology

- non-neoplastic:
  - hyperplastic: most common non-neoplastic polyp
  - mucosal polyps: small <5 mm, no clinical significance
  - inflammatory pseudopolyps: associated with IBD, no malignant potential
  - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, carcinoids
- neoplastic:
  - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
    - ♦ malignant risk due to associated adenomas (large bowel)
    - ♦ low malignant potential → most spontaneously regress or autoamputate
  - adenomas: premalignant, often carcinoma in situ:
    - ♦ some may contain invasive carcinoma ("malignant polyp" – 3-9%): invasion into muscularis
    - ♦ malignant potential: villous > tubulovillous > tubular (see Table 14)

**Figure 17. Sessile and pedunculated polyps**

**Table 14. Characteristics of Tubular vs. Villous Polyps**

	Tubular	Villous
<b>Incidence</b>	Common (60% to 80%)	Less common (10%)
<b>Size</b>	Small (<2 cm)	Large (usually >2 cm)
<b>Attachment</b>	Pedunculated	Sessile
<b>Malignant Potential</b>	Lower	Higher
<b>Distribution</b>	Even	Left-sided predominance

### Investigations

- colonoscopy is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscope if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

### Treatment

- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- surgical resection for those invading into muscularis (high risk of malignancy) and those too large to remove endoscopically
- follow-up endoscopy 1 yr later, then every 3-5 yr

## Familial Colon Cancer Syndromes

### FAMILIAL ADENOMATOUS POLYPOSIS (FAP)

#### Pathogenesis

- autosomal dominant (AD) inheritance, mutation in adenomatous polyposis coli (APC) gene on chromosome 5q21

#### Clinical Features

- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
- extracolonic manifestations:
  - carcinoma of small bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, small bowel
  - congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
  - virtually 100% lifetime risk of colon cancer (because of number of polyps)

- variants:
  - Gardner's syndrome: FAP + extraintestinal lesions (sebaceous cysts, osteomas, desmoid tumours)
  - Turcot syndrome: FAP + CNS tumours (childhood cerebellar medulloblastoma)

### Investigations

- genetic testing (80-95% sensitive, 99-100% specific) (see sidebar)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery (see Figure 16); consider upper endoscopy to evaluate for periampullary tumours

### Treatment

- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

## HEREDITARY NON-POLYPOSIS COLORECTAL CANCER (HNPCC) – LYNCH SYNDROME

### Pathogenesis

- AD inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1) resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

### Clinical Features

- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr, lifetime risk 70-80% (M>F)
  - HNPCC I: hereditary site-specific colon cancer
  - HNPCC II: cancer family syndrome – high rates of extracolonic tumours (endometrial, ovarian, hepatobiliary, small bowel)

### Diagnosis

- Amsterdam Criteria:
  - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
  - 2 or more generations involved
  - 1 case must be diagnosed before 50 yr old
  - FAP is excluded
- genetic testing (80% sensitive) – colonoscopy mandatory even if negative
  - refer for genetic screening individuals who fulfill EITHER the Amsterdam Criteria (as above) OR the revised Bethesda Criteria (see sidebar)
- colonoscopy (starting age 20) annually
- surveillance for extracolonic lesions

### Treatment

- total colectomy and ileorectal anastomosis with annual proctoscopy

#### Referral Criteria for Genetic Screening for APC

- To confirm the diagnosis of FAP (in patients with  $\geq 100$  colorectal adenomas)
- To provide pre-symptomatic testing for individuals at risk for FAP (1st degree relatives who are  $\geq 10$  yr old)
- To confirm the diagnosis of attenuated FAP (in patients with  $\geq 20$  colorectal adenomas)

#### Revised Bethesda Criteria for HNPCC and Microsatellite Instability (MSI)

Tumours from individuals should be tested for MSI in the following situations:

- Colorectal cancer diagnosed in a patient who is less than 50 yr of age.
- Presence of synchronous, metachronous colorectal, or other HNPCC-associated tumours, regardless of age.
- Colorectal cancer with the MSI-H histology diagnosed in a patient who is less than 60 yr of age.
- Colorectal cancer diagnosed in one or more first-degree relatives with an HNPCC-related tumour, with one of the cancers being diagnosed under age 50 yr.
- Colorectal cancer diagnosed in two or more first- or second-degree relatives with HNPCC-related tumours, regardless of age.

Elderly persons who present with iron-deficiency anemia should be investigated for colon cancer.

#### Staging for CRC

- I T1,2 N0 M0
- II T3,4 N0 M0
- III TxN+ M0
- IV TxNxM1

#### 5-year Survival Rates for CRC

Stage	Colon	Rectum
I	74%	74%
IIA	67%	64%
IIB	59%	52%
IIC	37%	32%
IIIA	73%	74%
IIIB	46%	45%
IIIC	28%	33%
IV	6%	6%

## Colorectal Carcinoma (CRC)

### Epidemiology

- 4th most common cancer (after lung, prostate and breast), 2nd most common cause of cancer death

### Risk Factors

- most patients have no specific risk factors
- age >50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, family history of CRC
- colonic conditions:
  - adenomatous polyps (especially if >1 cm, villous, multiple)
  - IBD (especially UC: risk is 1-2%/yr if UC >10 yr)
  - previous colorectal cancer (also gonadal or breast)
- diet (increased fat, red meat, decreased fibre) and smoking
- diabetes mellitus and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)

### Pathogenesis

- adenoma-carcinoma sequence; rarely arise *de novo*

**Clinical Features** (see Table 15)

- often asymptomatic
- hematochezia/melena, abdominal pain, change in bowel habits
- others: weakness, anemia, weight loss, palpable mass, obstruction
- 20% patients have distant metastatic disease at time of presentation
- spread:
  - direct extension, lymphatic, hematogenous (liver most common, lung, bone, brain; tumour of distal rectum → IVC → lungs)
  - peritoneal seeding: ovary, Blumer's shelf (pelvic cul-de-sac)

**Table 15. Clinical Presentation of CRC**

	Right Colon	Left Colon	Rectum
<b>Frequency</b>	25%	35%	30%
<b>Pathology</b>	Exophytic lesions with occult bleeding	Annular, invasive lesions	Ulcerating
<b>Symptoms</b>	Weight loss, weakness, rarely obstruction	Constipation ± overflow (alternating bowel patterns), abdominal pain, decreased stool caliber, rectal bleeding	Obstruction, tenesmus, rectal bleeding
<b>Signs</b>	Fe-deficiency anemia, RLQ mass (10%)	BRBPR, LBO	Palpable mass on DRE, BRBPR

**Investigations**

- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema ("apple core" lesion) + sigmoidoscopy
- if a patient is FOBT +ve, or has microcytic anemia or has a change in bowel habits, do colonoscopy
- laboratory: CBC, urinalysis, liver enzymes, liver function test, carcinoembryonic antigen (CEA) (preoperative for baseline, >5 ng/mL have worse prognosis)
- staging (see Table 16 and sidebar): chest, abdominal and pelvis CT; bone scan, CT head only if lesions suspected
- rectal cancer: pelvic MRI or endorectal ultrasound to determine T and N stage

**Table 16. TNM Classification System for Staging of Colorectal Carcinoma (AJCC/IUCC 2010)**

Primary Tumour (T)	Regional Lymph Nodes (N)	Distant Metastasis (M)
T0 No primary tumour found	N0 No regional node involvement	M0 No distant metastasis
Tis Carcinoma in situ	N1 Metastasis in 1-3 regional nodes	M1 Distant metastasis
T1 Invasion into submucosa	N2 Metastasis in 4 or more regional nodes	
T2 Invasion into muscularis propria		
T3 Invasion through muscularis propria and into serosa		
T4 Invasion into adjacent structures or organs		

**Treatment**

- **colon cancer**
  - wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
    - ♦ curative: wide resection of lesion (5 cm margins) with nodes and mesentery
    - ♦ palliative: if distant spread, local control for hemorrhage or obstruction
    - ♦ care is taken to not spread tumour by unnecessary palpation
    - ♦ cancer-bearing portion of colon is removed according to vascular distribution of segment
  - adjuvant chemotherapy (5-FU or oral capecitabine with oxaliplatin) can be considered for stage II or III
- **rectal cancer**
  - choice of operation depends on individual case. Types of operations (see Figure 18):
    - ♦ low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins; uses technique of total mesorectal excision
    - ♦ abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
    - ♦ local excision: for select T1 lesions only
    - ♦ palliative procedures: electrocoagulation or laser photocoagulation for unresectable cancers for symptom relief
  - adjuvant therapy:
    - ♦ combined neoadjuvant chemoradiation therapy followed by postoperative adjuvant chemotherapy for stage II and III

**Follow-Up**

- currently there are no data suggesting optimal follow-up
- combination of periodic CT chest/abdo/pelvis, CEA and colonoscopy is recommended
- CEA to monitor for initial response to treatment, and to assess for recurrence q3mo (not a screening test)
- intensive follow-up improves overall survival in low risk patients

**Figure 18. APR vs. LAR**

APR removes distal sigmoid colon, rectum and anus, permanent end colostomy required.

LAR removes distal sigmoid and rectum with anastomosis of distal colon to anus.

**Preoperative versus Postoperative Chemoradiotherapy for Locally Advanced Rectal Cancer: Results of the German CAO/ARO/AIO-94 Randomized Phase III Trial after a Median Follow-Up of 11 Years**

*J Clin Oncol* 2012; 30: 1926–1933.

**Background:** The CAO/ARO/AIO-94 trial (published 2004) recommended preoperative chemoradiotherapy (CRT) as standard treatment for locally advanced rectal cancer. However, no survival benefit was shown after median follow-up of 46 mo, and this study reports long-term effects.

**Methods:** Patients with stage II to III rectal cancer (n=799) were randomly assigned to preop (n=404) or postop CRT (n=395) with fluorouracil (FU), radiation, and adjuvant FU chemotherapy, in addition to total mesorectal excision surgery. Follow-up was designed to assess long-term overall survival as the primary end point; and cumulative incidence of local and distant relapses and disease-free survival as secondary end points.

**Results:** 10-yr incidence of local relapse was significantly lower in the preop CRT group than in the postop group (7.1% vs. 10.1%, p=0.048). Overall survival at 10 yr was similar at ~60% for patients treated with preop or postop CRT (p=0.85). Disease-free survival rates at 10 yr were similar at ~68% for patients treated with preop or postop CRT (p=0.54). No significant difference was detected for 10-yr incidence of distant metastases (preop CRT 29.8% vs. postop CRT 29.6%, p=0.9).

**Conclusion:** There is long-term reduction in local recurrence of stage II to III rectal cancer with preoperative chemotherapy, but no improvement in overall survival or distant recurrence of disease.

## Other Conditions of the Large Intestine

### Angiodysplasia

#### Definition

- vascular anomaly: focal submucosal venous dilatation and tortuosity

#### Clinical Features

- most frequently in right colon of patients >60 yr old
- bleeding typically intermittent, rarely massive, not usually hypotensive (melena, anemia, guaiac positive stools)

#### Investigations

- colonoscopy: cherry red spots, branching pattern from central vessel
- angiography: early-filling vein, vascular tuft, delayed emptying vein; rarely active bleeding
- RBC technetium-99 scan
- barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

#### Treatment

- none if asymptomatic
- cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

### Volvulus

#### Definition

- rotation of segment of bowel about its mesenteric axis
- sigmoid (65%), cecum (30%), transverse colon (3%), splenic flexure (2%)
- 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

#### Risk Factors

- age (50% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
- high fibre diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, institutionalization (less frequent evacuation of bowels)
- congenital hypermobile cecum

#### Clinical Features

- symptoms due to bowel obstruction (see GS24) or intestinal ischemia (see GS28)
- colicky abdominal pain, persistence of pain between spasms, abdominal distention, vomiting

#### Investigations

- AXR (classic findings): "omega", "bent inner-tube", "coffee-bean" signs
- barium/Gastrografin® enema: "ace of spades" (or "bird's beak") appearance due to funnel-like luminal tapering of lower segment towards volvulus
- sigmoidoscopy or colonoscopy as appropriate
- CT

#### Treatment

- initial supportive management (same as initial management for bowel obstruction (see GS24))
- cecum:
  - nonsurgical:
    - ♦ may attempt colonoscopic detorsion and decompression
  - surgical:
    - ♦ right colectomy + ileotransverse colonic anastomosis
- sigmoid:
  - nonsurgical:
    - ♦ decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
    - ♦ subsequent elective surgery recommended (50-70% recurrence)
  - surgical: Hartmann procedure (if urgent)
    - ♦ indications: strangulation, perforation or unsuccessful endoscopic decompression

#### Cecal Volvulus

AXR: Central cleft of "coffee bean" sign points to RLQ.

#### Sigmoid Volvulus

AXR: Central cleft of "coffee bean" sign points to LLQ.

Barium enema: "ace of spades" or "birds beak" sign.

## Fistula

### Definition

- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, entero-enteric)

### Etiology

- foreign object erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD (especially Crohn's), diverticular disease)
- iatrogenic/surgery (e.g. postoperative anastomotic leak, radiation)
- congenital, trauma
- neoplastic

### Investigations

- ultrasound, CT scan, fistulogram
- measure amount of drainage from fistula

### Treatment

- decrease secretion: octreotide/somatostatin/omeprazole
- surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis

#### Why Fistulae Stay Open

##### FRIENDO

- Foreign body
- Radiation
- Infection
- Epithelialization
- Neoplasm
- Distal obstruction (most common)
- Others: increased flow; steroids (may inhibit closure, usually will not maintain fistula)

## Stomas

### Definition

- an opening of the GI tract onto the surface of the abdomen wall

### Ileostomy

- usually positioned in RLQ; ileum is brought through rectus abdominus muscles
- indications: after colectomy for ulcerative colitis, in some cases of Crohn's disease or familial polyposis
- conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
- continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

### Colostomy

- indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
- colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
- most common permanent colostomy is a sigmoid colostomy – expels stool once per day, no appliance required
- chronic paracolostomy hernia is a common complication

### Complications (10%)

- obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
- peri-ileostomy abscess and fistula
- skin irritation
- prolapse or retraction
- diarrhea (excessive output)

Figure 19. Ostomies

#### Colostomy/Ileostomy

- Connection of proximal limb of colon or ileum to abdominal wall skin

#### Mucous Fistula

- Connection of distal limb of colon to abdominal wall skin

#### Ileal Conduit

- Connection of bowel to ureter proximally and abdominal wall distally to drain urine

Figure 20. End vs. loop colostomy

# Anorectum

## Hemorrhoids

### Etiology

- vascular and connective tissue complexes form a plexus of dilated veins (cushion)
  - internal: superior hemorrhoidal veins, above dentate line, portal circulation
  - external: inferior hemorrhoidal veins, below dentate line, systemic circulation

### Risk Factors

- increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal hypertension, heavy lifting

### Clinical Features and Treatment

- internal hemorrhoids:
  - engorged vascular cushions usually at 3, 7, 11 o'clock positions (patient in lithotomy position)
  - PAINLESS rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, rectal fullness:
    - 1st degree:** bleed but do not prolapse through the anus
      - treatment: high fibre/bulk diet, sitz baths, steroid cream, pamoxyne (Anusol®), rubber band ligation, sclerotherapy, photocoagulation
    - 2nd degree:** bleed, prolapse with straining, spontaneous reduction
      - treatment: rubber band ligation, photocoagulation
    - 3rd degree:** bleed, prolapse, requires manual reduction
      - treatment: same as 2nd degree, but may require closed hemorrhoidectomy
    - 4th degree:** bleed, permanently prolapsed, cannot be manually reduced
      - treatment: closed hemorrhoidectomy
- external hemorrhoids:
  - dilated venules usually mildly symptomatic
    - PAIN after bowel movement, associated with poor hygiene
    - medical treatment: dietary fibre, stool softeners, steroid cream (short course), pamoxyne (Anusol®), avoid prolonged straining
  - thrombosed hemorrhoids are very painful:
    - resolve within 2 wk, may leave excess skin = perianal skin tag
    - treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

Always rule out more serious causes (e.g. colon CA) in a person with hemorrhoids and rectal bleeding.

Figure 21. Hemorrhoids

Band ligation can be done as outpatient.

External hemorrhoids will often recur.

Table 17. Signs and Symptoms of Internal vs. External Hemorrhoids

Internal Hemorrhoids	External Hemorrhoids
Painless bright red blood per rectum	Sudden severe perianal pain
Rectal fullness or discomfort	Perianal mass
Mucus discharge	

## Anal Fissures

### Definition

- tear of anal canal below dentate line (very sensitive squamous epithelium)
- 90% posterior midline, 10% anterior midline
- if off midline: consider other possible causes such as IBD, STIs, TB, leukemia or anal carcinoma
- repetitive injury cycle after first tear:
  - sphincter spasm occurs preventing edges from healing and leads to further tearing
  - ischemia may ensue and contribute to chronicity

### Etiology

- forceful dilation of anal canal: large, hard stools and irritant diarrheal stools
- tightening of anal canal secondary to nervousness/pain leads to further tearing
- others: habitual use of cathartics, childbirth

### Clinical Features

- acute fissure:
  - very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
  - treatment is conservative: stool softeners, bulking agent, sitz baths (heals 90%)
- chronic fissure (anal ulcer):
  - triad: fissure, sentinel skin tags, hypertrophied papillae

- treatment:
  - ♦ stool softeners, bulking agents, sitz baths
  - ♦ topical nitroglycerin or nifedipine: increases local blood flow, promoting healing and relieves sphincter spasm
  - ♦ lateral internal anal sphincterotomy (most effective): objective is to relieve sphincter spasm → increases blood flow and promotes healing; but 5% chance of fecal incontinence therefore not commonly done
- alternative treatment:
  - ♦ botulinum toxin: inhibits release of acetylcholine (ACh), reducing sphincter spasm

## Anorectal Abscess

### Definition

- infection in one or more of the anal spaces
- usually bacterial infection of blocked anal gland at the dentate line
  - *E. coli*, *Proteus*, *Streptococci*, *Staphylococci*, *Bacteroides*, anaerobes

Figure 22. Different types of perianal abscesses

### Clinical Features

- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralelevator) or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

### Treatment

- incision and drainage
  - curative in 50% of cases
  - 50% develop anorectal fistulas
- may require antibiotics if diabetic, heart murmur or cellulitis

Recurrent perianal abscesses is associated with Crohn's disease.

Antibiotics are not typically helpful in the treatment of perianal abscesses.

## Fistula-In-Ano

### Definition

- anal fistula from rectum to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

### Etiology

- see *Fistula*, GS37
- same perirectal process as an anal abscess, therefore usually associated with an abscess
- other causes: post-op, trauma, anal fissure, malignancy, radiation proctitis

### Clinical Features

- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

**Treatment**

- identification:
  - internal opening:
    - ♦ Goodsall's rule
      - fistulas originating anterior to transverse line through the anus will course straight ahead and exit anteriorly, whereas those with exit posterior to the transverse line will have a curved tract and originate in the midline
  - fistulous tract:
    - ♦ probing or fistulography under anesthesia
- surgery:
  - fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
  - low lying fistula (does not involve external sphincter) → primary fistulotomy
  - high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract:
    - ♦ promotes drainage
    - ♦ promotes fibrosis and decreases incidence of incontinence
    - ♦ delineates anatomy
    - ♦ usually done to spare muscle cutting

**Postoperative**

- sitz baths, irrigation and packing to ensure healing proceeds from inside to outside

**Complications**

- recurrence
- rarely fecal incontinence

**Figure 23. Goodsall's rule****Figure 24. Fistulotomy**

## Pilonidal Disease

**Definition**

- chronic recurring abscess or chronic draining sinus in sacrococcygeal area

**Epidemiology**

- occurs most frequently in young men age 15-40 yr; rare in >50 yr

**Etiology**

- obstruction of the hair follicles in this area → formation of cysts, sinuses or abscesses

**Clinical Features**

- asymptomatic until acutely infected, then pain/tenderness, purulent discharge, inspissated hair

**Treatment**

- acute abscess:
  - I&D (often performed by primary care doctors)
  - wound packed open
  - 40% develop chronic pilonidal sinuses
- surgery:
  - indication: failure of healing after I&D, recurrent disease, complex disease
  - pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

## Rectal Prolapse

**Definition**

- protrusion of some or all of rectal mucosa through external anal sphincter

**Epidemiology**

- extremes of ages: <5 yr old and >5th decade
- 85% women

**Etiology**

- lengthened attachment of rectum secondary to constant straining
- 2 types:
  - I. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
  - II. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
    - ♦ first degree: prolapse includes mucocutaneous junction
    - ♦ second degree: without involvement of mucocutaneous junction
    - ♦ third degree (internal intussusception): prolapse is internal, concealed, or occult

**Figure 25. Rectal prolapse (true vs. false)**

**Risk Factors**

- gynecological surgery
- chronic neurologic/psychiatric disorders affecting motility

**Clinical Features**

- extrusion of mass with increased intra-abdominal pressure:
  - straining, coughing, laughing, Valsalva
- difficulty in bowel regulation:
  - tenesmus, constipation, fecal incontinence
- permanently extruded rectum with excoriation, ulceration and constant soiling
- may be associated with urinary incontinence or uterine prolapse

**Treatment**

- Type I:
  - conservative: gentle manual reduction of prolapsed area, especially in children
  - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II:
  - conservative: reduce if possible
  - surgery: abdominal, perineal, transsacral approaches

## Anal Neoplasms

**ANAL CANAL****Squamous Cell Carcinoma (SCC) of Anal Canal (above dentate line)**

- most common tumour of anal canal (75%)
- anus prone to human papilloma virus (HPV) infection, therefore at risk for anal squamous intraepithelial lesions (ASIL)
  - high grade squamous intraepithelial lesion (HSIL) and low grade squamous intraepithelial lesion (LSIL) terminology used
- clinical features: anal bleeding, pain, mass, ulceration, pruritus; 25% asymptomatic
- treatment: chemotherapy ± radiation ± surgery
- prognosis: 80% 5-yr survival

**Malignant Melanoma of Anal Canal**

- 3rd most common site for primary malignant melanoma after skin, eyes
- aggressive, distant metastases common at time of diagnosis
- treatment: wide excision or APR ± chemoradiation
- prognosis: <5% 5-yr survival

**ANAL MARGIN**

- clinical features and treatment as for skin tumours elsewhere
- squamous and basal cell carcinoma, Bowen's disease (SCC in situ) and Paget's disease

## Liver

Figure 26. Anatomy of liver

## Liver Cysts

### SIMPLE CYSTS

- most common type of liver cyst, may have multiple simple cysts
- clinical features: usually asymptomatic, if large may present with pain or mass; diagnose with U/S
- treatment: generally not required for simple cysts unless very large
- complications: intracystic hemorrhage (may be confused with complex cysts)

### POLYCYSTIC LIVER DISEASE

- progressive condition where cysts replace much of the liver
- 50% associated with polycystic kidney disease
- treatment: if symptomatic treat by partial liver resection or by creating drainage for cysts

### CHOLEDOCHAL CYSTS

- congenital malformations of pancreaticobiliary tree; majority present before age 10 yr
- 5 types, most extreme form called Caroli's disease (multiple cystic dilations in intrahepatic ducts)
- clinical features: recurrent abdominal pain, intermittent jaundice, RUQ mass, cholangitis, pancreatitis
- diagnosis: U/S, CT, transhepatic cholangiography, LFTs
- treatment:
  - high risk of malignancy, current treatment is complete excision of cysts
  - abnormal pancreaticobiliary junction is associated with increased risk of malignancy
  - liver transplant indicated if cyst involves intrahepatic bile ducts (Caroli's disease)
- complications of choledochal cysts: biliary cirrhosis, portal hypertension, rupture, cholangiocarcinoma

### HYDATID LIVER CYSTS (CYSTIC ECHINOCOCCOSIS)

- etiology:
  - infection with parasite *Echinococcus granulosus* commonly found in Southern Europe, Middle East, Australasia, South America
  - associated with exposure to dogs, sheep and cattle
- clinical features:
  - asymptomatic mass (most often) or chronic pain, hepatomegaly; if large may compress inferior vena cava
  - rupture can cause biliary colic, jaundice, cholangitis, pancreatitis, or anaphylactic reaction
- investigations:
  - detection of anti-*Echinococcus* Ab (IgG) using ELISA
  - U/S, CT: presence of mass, often calcified
  - needle biopsy
- treatment:
  - medical: albendazole (anti-helminthic) – cure up to 30%
  - surgical (risk of spillage into abdomen):
    - ♦ conservative: open endocystectomy or PAIR (Percutaneous Aspiration, Injection of protoscolicidal agent, Re-aspiration)
    - ♦ radical: partial hepatectomy or total pericystectomy

### CYSTADENOMA (PREMALIGNANT)/CYSTADENOCARCINOMA

- clinical features:
  - appear as complex cysts on imaging: internal septae, papillary projections, irregular lining
- all complex, multiloculated cysts (except echinococcal) should be excised because of malignancy risk

## Liver Abscesses

### Etiology

- types:
  - pyogenic (bacterial): most common etiology; most often polymicrobial – *E. coli*, *Klebsiella*, *Proteus*, *Strep. milleri*
  - parasitic (amoebic): *Entamoeba histolytica*
  - fungal: *Candida*
- sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

### Clinical Features

- fever, malaise, chills, anorexia, weight loss, abdominal pain, nausea
- RUQ tenderness, hepatomegaly, jaundice

### Investigations

- leukocytosis, anemia, elevated liver enzymes, hemagglutination titres for *Entamoeba* antibodies
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S

### Treatment

- treat underlying cause
- generally will treat initially with antibiotics alone and add surgical or percutaneous drainage and IV antibiotics for larger abscesses (initially ceftriaxone + metronidazole or piperacillin/tazobactam)

### Prognosis

- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, malnutrition

## Neoplasms

### BENIGN LIVER NEOPLASMS

#### Hemangioma (cavernous)

- pathogenesis: most common benign hepatic tumour; results from malformation of angioblastic fetal tissue
- risk factors: F:M = 3:1, steroid therapy, estrogen (exogenous, pregnancy)
- clinical features:
  - usually small and asymptomatic, larger tumours may produce pain or compress nearby structures
  - shock if ruptured (very rare), consumptive coagulopathy if giant (in children)
- investigations:
  - contrast CT (well-demarcated hypodense mass with peripheral enhancement and delayed venous emptying), U/S (homogenous hyperechoic mass), arteriography (rarely used; "cotton wool" appearance), RBC scan
  - biopsy may result in hemorrhage
- treatment:
  - usually none unless tumour bleeds or is symptomatic, then excision by lobectomy or enucleation

#### Focal Nodular Hyperplasia

- pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at centre of nodule
- risk factors: female, age 20-50
- clinical features: asymptomatic, rarely grows or bleeds, no malignant potential
- investigations: central stellate scar on CT scan; technetium-99 scan is helpful
- treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential) → often resected

#### Adenoma

- definition: benign glandular epithelial tumour
- risk factors: female, age 20-50, estrogen (OCP, pregnancy)
- clinical features: asymptomatic, 25% present with RUQ pain or mass
- investigations: CT (well-demarcated masses, often heterogeneous, isodense on non-contrast CT, peripheral enhancement/isodense/hypodense on contrast CT), U/S, biopsy (tendency to bleed following biopsy)
- treatment:
  - stop anabolic steroids or OCP
  - excise, especially if large (>5 cm), due to risk of transformation to hepatocellular carcinoma and spontaneous rupture/hemorrhage
  - smaller lesions can be effectively treated with embolization

### MALIGNANT LIVER NEOPLASMS

#### Primary

- usually hepatocellular carcinoma (HCC)/hepatoma
- others include angiosarcoma, hepatoblastoma, hemangioendothelioma
- epidemiology: 3rd leading cause of cancer death worldwide, 9th in United States; highest in Africa, China, Taiwan
- risk factors:
  - chronic liver inflammation: chronic hepatitis B (inherently oncogenic) and C, cirrhosis (especially macronodular), hemochromatosis,  $\alpha_1$ -anti-trypsin deficiency
  - medications: OCPs (3x increased risk), steroids
  - smoking, alcohol, Betel nuts
  - chemical carcinogens (aflatoxin, microcystin, vinyl chloride – associated with angiosarcoma)
- clinical features:
  - RUQ discomfort, right shoulder pain
  - jaundice, weakness, weight loss,  $\pm$  fever (if central tumour necrosis)
  - hepatomegaly, bruit, hepatic friction rub

Secondary liver metastases are common in many cancers, with some studies showing a prevalence of 40-50% amongst patients with extrahepatic cancers. They commonly arise from breast, lung and colorectal cancers. For metastases secondary to colorectal cancer, surgical resection offers the greatest likelihood of cure.

- ascites with blood (sudden intra-abdominal hemorrhage)
- paraneoplastic syndromes – hypoglycemia, hypercalcemia, erythrocytosis, watery diarrhea
- metastasis: lung, bone, brain, peritoneal seeding
- investigations:
  - elevated ALP, bilirubin, and  $\alpha$ -fetoprotein (80% of patients)
  - U/S (poorly-defined margins with internal echos), triphasic CT (enhancement on arterial phase and washout on portal venous phase), MRI, CT or MRI angiography
  - biopsy
- treatment:
  - cirrhosis is a *relative* contraindication to tumour resection due to decreased hepatic reserve
  - surgical: resection (10% of patients have resectable tumours)
  - liver transplant; may use bridging therapy while awaiting transplant
    - absolute contraindications:** extrahepatic disease, vascular invasion
    - relative contraindications:** dependent on liver transplant protocol based on staging criteria followed by transplant centre
  - non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheter arterial chemoembolization (TACE), chemotherapy (consider sorafenib for HCC; pre-op chemotherapy for hepatoblastoma is standard of care), radiotherapy
- prognosis:
  - median survival: 6-20 mo
  - 5-yr survival: all patients – 5%; patients undergoing complete resection – 11-40%

### Secondary

- most common hepatic malignancy
- etiology:
  - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, prostate
- treatment:
  - hepatic resection for metastatic colorectal liver metastases if control of primary is possible, no extrahepatic or extrapulmonary metastases and if possibility of “curative” resection
  - possible chemotherapy
- prognosis: 30-40% 5-yr survival with a “curative” resection; prognosis same if metastases are multilobar compared with confined to one lobe

### Staging Criteria for Hepatocellular Carcinoma

<b>Milan Criteria*</b>	1 tumour $\leq 5$ cm Up to 3 tumours each $\leq 3$ cm
<b>UCSF Criteria*</b>	1 tumour $\leq 6.5$ cm Up to 3 tumours each $\leq 4.5$ cm, total diameter $\leq 8$ cm
<b>Toronto Criteria*</b>	No tumour size or number restrictions No systemic symptoms Not poorly differentiated

\*Each criteria assumes no extrahepatic and no macrovascular invasion.

### Differential Diagnosis of Metastatic Liver Mass

Some GU Cancers Produce Bumpy Lumps:

Stomach  
GenitoUrinary cancers  
(kidney, ovary, uterus)  
Colon  
Pancreas  
Breast  
Lung

### Child-Turcotte-Pugh Score (Prognosis of Chronic Liver Disease/Cirrhosis, Including Postoperatively)

	1 Point	2 Points	3 Points
Albumin (g/L)	$>35$	28-35	$<28$
Ascites	Absent	Easily controlled	Poorly controlled
Bilirubin (umol/L)	$<34$	34-51	$>51$
(mg/dL)	$<2.0$	2.0-3.0	$>3.0$
Coagulation (INR)	$<1.7$	1.7-2.3	$>2.3$
Hepatic encephalopathy	None	Minimal (Grade I-II)	Advanced (Grade III-IV)
Points	Class	One Year Survival	Two Year Survival
5-6	A	100%	85%
7-9	B	81%	57%
10-15	C	45%	35%

### Living Liver Donors vs. Deceased Liver Donors

The right lobe of a living donor liver is transplanted into the recipient whereas whole livers from deceased donors are transplanted orthotopically into the recipient.

## Liver Transplantation

Table 18. Conditions Leading to Transplantation

Parenchymal Disease	Cholestatic Disease	Inborn Errors	Tumours
Chronic hepatitis B or C*	Biliary atresia**	$\alpha_1$ -anti-trypsin deficiency	Hepatocellular carcinoma
Alcoholic cirrhosis	Primary biliary cirrhosis	Wilson's disease	
Acute liver failure	Sclerosing cholangitis	Hemochromatosis	
Budd-Chiari syndrome			
Congenital hepatic fibrosis			
Cystic fibrosis (CF)			
Autoimmune Hepatitis			
Cryptogenic Cirrhosis			
Wilson's disease			

\*Leading cause in adults; \*\*leading cause in children

### Clinical Indications

- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially decompensated cirrhosis, unresectable primary liver cancers and fulminant hepatic failure
- end-stage liver disease with life expectancy  $<1$  yr and if no other therapy is appropriate
- progressive jaundice, refractory ascites, spontaneous hepatic encephalopathy, recurrent sepsis, fulminant hepatic failure
- recurrent variceal hemorrhage, coagulopathy, severe fatigue

### Criteria for Transplantation

- Model for End-Stage Liver Disease (MELD): considers probability of death within 3 mo if patient does not receive transplant; based on creatinine, bilirubin, INR; MELD scores from 6-40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: patient must have  $\geq 7$  points (Class B)

### Contraindications

- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr
- advanced cardiopulmonary disease

## Post-op Complications

- primary non-function (graft failure): urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: hypertension, renal disease, diabetes, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

## Prognosis

- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%

# Biliary Tract

## Cholelithiasis

### Definition

- the formation of gallstones

### Pathogenesis

- imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
- excessive hepatic cholesterol secretion → bile salts and lecithin are "overloaded" → supersaturated cholesterol can precipitate and form gallstones
- North America: cholesterol stones (80%), pigment stones (20%)

### Risk Factors

- cholesterol stones:
  - obesity, age <50
  - estrogens: female, multiparity, OCPs
  - ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
  - terminal ileal resection or disease (e.g. Crohn's disease)
  - impaired gallbladder emptying: starvation, TPN, DM
  - rapid weight loss: rapid cholesterol mobilization and biliary stasis
- pigment stones (contain calcium bilirubinate):
  - cirrhosis
  - chronic hemolysis
  - biliary stasis (strictures, dilation, biliary infection)
- protective factors: statins, vitamin C, coffee

Figure 27. Gallstone disease

### Clinical Features

- asymptomatic (80%):
  - most do NOT require treatment
  - consider cholecystectomy if: increased risk of malignancy (choledochal cysts, Caroli's disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, diabetes, immunosuppression

### Which Matters Most: Number of Tumors, Size of the Largest Tumour, or Total Tumour Volume?

*Liver Transplant 2011;17:S58-66*

**Purpose:** To determine if the size and/or number of hepatocellular carcinoma (HCC) nodules predict disease recurrence and survival after liver transplantation.

**Methods:** Systematic review and meta-analysis.

**Results:** 74 studies were included for analysis. Patients beyond the Milan criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the UCSF criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the Milan criteria but within the UCSF criteria had reduced overall and disease-free survivals. Overall and disease-free survivals were reduced for patients with larger total tumour diameter,  $\geq 10$  cm vs.  $< 10$  cm and  $\geq 9$  cm vs.  $< 9$  cm, respectively. Similarly, patients with higher diameter of largest tumour nodule ( $\geq 3$  cm vs.  $< 3$  cm) had reduced overall survival and higher recurrence. Overall and disease-free survivals were reduced and recurrence higher for patients with tumour size  $\geq 5$  cm vs.  $< 5$  cm. Mixed results were found regarding number of tumour nodules.

**Conclusion:** Tumour size and volume are important factors in survival after liver transplantation.

### Living Donor Liver Transplantation Versus Deceased Donor Liver Transplantation for Hepatocellular Carcinoma: Comparable Survival and Recurrence

*Liver Transplant 2012;18:315-322*

**Purpose:** To compare the overall survival and hepatocellular carcinoma (HCC) recurrence rates after living donor liver transplantation (LDLT) versus deceased donor liver transplantation (DDLT) in a series of patients with HCC.

**Methods:** Study conducted between 1996 and 2009 at a single centre. 345 patients with HCC undergoing liver transplantation included.

**Results:** The overall survival rates at 1, 3, and 5 yr did not significantly differ between the LDLT and DDLT groups ( $p = 0.62$ ). Disease free survival at 1, 3, and 5 yr did not differ between the groups ( $p = 0.82$ ). The recurrence rates at 1, 3, and 5 yr also did not differ between the two groups ( $p = 0.54$ ).

**Conclusion:** LDLT and DDLT lead to similar survival and recurrence rates.

### Summary of Biliary Tract Conditions

Gall Bladder	Asymptomatic	Pain Only	Infection + Pain
Cholelithiasis	✓ (majority)		
Biliary Colic		✓	
Cholecystitis			✓
Common Bile Duct	Asymptomatic	Pain Only	Infection + Pain
Choledocholithiasis	✓ (majority)	✓	
Cholangitis			✓ (majority)

### Risk Factors for Cholesterol Stones

4Fs  
Fat  
Female  
Fertile  
Forties

- biliary colic (10-25%)
- cholecystitis
- choledocholithiasis (8-15%)
- cholangitis
- gallstone pancreatitis (see *Acute Pancreatitis*, GS50)
- gallstone ileus

### Investigations

- U/S – diagnostic procedure of choice:
  - image for signs of inflammation, obstruction, localization of stones
- ERCP (endoscopic retrograde cholangiopancreatography):
  - visualization of upper GI tract, ampullary region, biliary and pancreatic ducts
  - method for treatment of CBD stones in periampullary region
  - complications: traumatic pancreatitis (1-2%), pancreatic or biliary sepsis
- MRCP (magnetic resonance cholangiopancreatography):
  - same information gained as ERCP but non-invasive
  - cannot be used for therapeutic purposes
- PTC (percutaneous transhepatic cholangiography):
  - injection of contrast via needle passed through hepatic parenchyma
  - useful for proximal bile duct lesions or when ERCP fails or not available
  - requires prophylactic antibiotics
  - contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, disease of right lower lung or pleura
  - complications: bile peritonitis, chylothorax, pneumothorax, sepsis, hemobilia
- HIDA scan (hepatobiliary imino-diacetic acid scan):
  - used less commonly
  - radioisotope technetium-99 injected into a vein is excreted in high concentrations into bile, allowing visualization of the biliary tree
  - does not visualize stones; diagnosis by seeing occluded cystic duct or CBD

## Biliary Colic

### Pathogenesis

- gallstone transiently impacted in cystic duct, no infection

### Clinical Features

- steady, severe dull pain in epigastrium or RUQ for minutes to hours, crescendo-decrescendo pattern
- may present with chest pain
- frequently occurs at night or after fatty meal, not after fasting
- can radiate to right shoulder or scapula
- patients often restless
- no peritoneal findings, no systemic signs

### Investigations

- normal blood work: CBC, electrolytes, LFTs, bilirubin, amylase
- U/S shows cholelithiasis, may show stone in cystic duct

### Treatment

- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success):
  - complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, vessel injury
  - laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
  - risk of open cholecystectomy higher in emergency situations

## Acute Cholecystitis

### Pathogenesis

- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no cholelithiasis in 5-10% (see *Acalculous Cholecystitis*, GS47)

### Clinical Features

- often have history of biliary colic
- severe constant (hours to days) epigastric or RUQ pain, anorexia, nausea, vomiting, low grade fever (<38.5°C)
- focal peritoneal findings: Murphy's sign, palpable, tender gallbladder (in 33%)
- Boas' sign: right subscapular pain

### Investigation

- bloodwork: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative

### 2 Most Important Lab Tests for Biliary Pain:

- Amylase
- Bilirubin

Biliary colic is a **constant** pain not colicky.

### Early versus Delayed Laparoscopic Cholecystectomy for Biliary Colic

*Cochrane DB Syst Rev 2008;4:CD007196*

**Study:** To assess the benefits and harms of early versus delayed laparoscopic cholecystectomy for patients with biliary colic due to gallstones.

**Selection criteria:** Only RCTs. 1 study including 75 patients found.

**Results:** During the waiting period in the delayed group (mean 4.2 mo), the complications that the patients suffered included severe acute pancreatitis resulting in mortality (1), empyema of gallbladder (1), gallbladder perforation (1), acute cholecystitis (2), cholangitis (2), obstructive jaundice (2), and recurrent biliary colic requiring hospital visits (5). The rate of conversion to open cholecystectomy was lower in the early group (0%) than the delayed group (20%). There was a statistically significant shorter operating time and hospital stay in the early group than the delayed group (WMD -14.80 min, 95% CI -18.02 to -11.58 and -1.25 d, 95% CI -2.05 to -0.45 respectively). Fourteen patients (35%) required 18 hospital admissions for symptoms related to gallstones during the mean waiting period of 4.2 mo in the delayed group.

**Conclusion:** Early laparoscopic cholecystectomy (<24 h of diagnosis of biliary colic) decreases the morbidity during the waiting period for elective laparoscopic cholecystectomy, decreases the rate of conversion to open cholecystectomy, decreases operating time, and decreases hospital stay.

### Acalculous Cholecystitis

- Acute or chronic cholecystitis in the absence of stones, typically due to gallbladder ischemia, stasis
- Risk factors: DM, immunosuppression, ICU admission, trauma patient, TPN, sepsis
- Clinical features same as Acute cholecystitis, occurs in 20% of cases of acute cholecystitis
- Investigations: U/S shows sludge in gallbladder, other U/S features of cholecystitis (see above), CT or HIDA scan
- Treatment: broad-spectrum antibiotics, cholecystectomy, if patient unstable → cholecystostomy

### Rouviere's Sulcus

Fissure between right lobe and caudate process of liver. Keeping dissection anterior to this landmark prevents bile duct injury.

### Critical View of Safety

Space between the gallbladder and liver clear of any structures other than the cystic artery.

## Complications

- gallbladder mucocele (hydrops): long term cystic duct obstruction results in mucous accumulation in gallbladder (clear fluid)
- gangrene (20%), perforation (2%): result in abscess formation or peritonitis
- empyema of gallbladder: suppurative cholecystitis, pus in gallbladder + sick patient
- cholecystoenteric fistula, from repeated attacks of cholecystitis, can lead to gallstone ileus
- emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall or pericholecystic space (risk in diabetic patient)
- Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct

## Treatment

- admit, hydrate, NPO, NG tube (if persistent vomiting from associated ileus), analgesics once diagnosis is made
- antibiotics:
  - cefazolin if uncomplicated cholecystitis
- cholecystectomy:
  - early (within 72 h) vs. delayed (after 6 wk)
    - equal morbidity and mortality
    - early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
    - emergent OR indicated if high risk, e.g. emphysematous
  - laparoscopic is standard of care (convert to open for complications or difficult case)
    - laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-op pain, increased risk of bile duct injury
- intra-operative cholangiography (IOC):
  - indications: clarify bile duct anatomy, obstructive jaundice, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct ( $>15$  mm), single faceted stone in gallbladder, bilirubin  $>137$   $\mu\text{mol/L}$
- percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

### Mirizzi Syndrome

Extrinsic compression of the common hepatic duct by a gallstone in the cystic duct or Hartmann's pouch. Impacted gallstone may erode into the CHD or CBD, creating a cholecystohepatic or cholecystocholedocal fistula. Mirizzi syndrome has an association with gallbladder cancer.

**Biliary colic** is treated with analgesia and elective cholecystectomy

**Acute cholecystitis** is treated with antibiotics and early cholecystectomy

### Does this Patient have Acute Cholecystitis?

JAMA 2003;289:80-86

**Purpose:** To determine which patients need imaging techniques to diagnose acute cholecystitis.

**Methods:** 17 studies published between 1950 and 2002 were included. They evaluated the findings of history, physical exam, and basic laboratory tests in adult patients with abdominal pain or suspected acute cholecystitis. Studies used a control group with no diagnosis of acute cholecystitis, and acute cholecystitis was diagnosed through various methods including surgery and pathologic examination.

**Results:** No clinical or laboratory finding was statistically significant to rule in or rule out the diagnosis of acute cholecystitis. However, a positive Murphy's sign ( $\text{LR+} = 2.8$ , 95% CI 0.8-86), and absence of right upper quadrant tenderness ( $\text{LR-} 0.4$ , 95% CI 0.2-1.1) were the most consistent in their diagnostic value, despite neither being statistically significant.

**Conclusions:** No single clinical findings or laboratory test can rule in or rule out the diagnosis of acute cholecystitis. It is through a combination of clinical findings and diagnostic imaging that the diagnosis of acute cholecystitis is made in patients presenting with abdominal pain.

### Laparoscopic vs. Open Cholecystectomy

#### Laparoscopic Cholecystectomy

- Shorter operating time
- Shorter length of stay
- Shorter sick leave
- Shorter time to return to daily activities
- Less postoperative pain
- Decreased use of postoperative analgesia
- Decreased reduction in pulmonary function\*
- Fewer pulmonary complications
- Decreased acute phase response
- Less impairment in intestinal motility\*

#### Open Cholecystectomy

- Lower conversion rates to open surgery (for mini-laparotomies)

\*NOTE:

Pulmonary function =  $\text{O}_2$  consumption, spirometric parameters, arterial blood gases, and acid-base balance  
Intestinal motility = auscultating intestinal peristalsis, abdominal circumference measurement, and time interval to restitution of defecation

## Acalculous Cholecystitis

### Definition

- acute or chronic cholecystitis in the absence of stones

### Pathogenesis

- typically due to gallbladder ischemia, stasis

### Risk Factors

- DM, immunosuppression, ICU admission, trauma patient, TPN, sepsis

### Clinical Features

- see *Acute Cholecystitis*, GS46
- occurs in 20% of cases of acute cholecystitis

### Investigations

- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see *Acute Cholecystitis*, GS46)
- CT or HIDA scan

### Treatment

- broad-spectrum antibiotics, cholecystectomy
- if patient unstable  $\rightarrow$  cholecystostomy

## Choledocholithiasis

### Definition

- stones in common bile duct (CBD)

### Clinical Features

- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, fluctuating jaundice
- primary vs. secondary stones:
  - primary: formed in bile duct, indicates bile duct pathology (e.g. benign biliary stricture, sclerosing cholangitis, choledochal cyst, cystic fibrosis)
  - secondary: formed in gallbladder (85% of cases in U.S.)

### Investigations

- CBC: usually normal; leukocytosis suggests cholangitis
- LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), ALP, GGT later
- amylase/lipase: to rule out gallstone pancreatitis
- U/S: intra/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
- ERCP, PTC
- MRCP (90% sensitive, almost 100% specific, not therapeutic)

### Complications

- cholangitis, pancreatitis, biliary stricture and biliary cirrhosis

### Treatment

- if no evidence of cholangitis: treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

#### American Society of Gastrointestinal Endoscopy 2010 Predictors for Risk of CBD Stones:

- Very strong:
  - CBD stone on ultrasound
  - Clinical ascending cholangitis
  - Bilirubin > 68  $\mu\text{mol/L}$
- Strong:
  - CBD dilated > 6 mm on ultrasound
  - Bilirubin 31-68  $\mu\text{mol/L}$
- Moderate:
  - Abnormal liver test (besides bilirubin)
  - Age > 55 yr
  - Clinical gallstone pancreatitis

## Acute Cholangitis

### Pathogenesis

- obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration and biliary sepsis – may be life-threatening, especially in elderly

### Etiology

- choledocholithiasis (60%), stricture, neoplasm (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), biliary stent
- organisms: *E. coli*, *Klebsiella*, *Pseudomonas*, *Enterococcus*, *B. fragilis*, *Proteus*

### Clinical Features

- Charcot's triad: fever, RUQ pain, jaundice
- Reynold's pentad: fever, RUQ pain, jaundice, shock, confusion
- may have nausea, vomiting, abdominal distention, ileus, acholic stools, tea-coloured urine (elevated direct bilirubin)

#### Charcot's Triad

Fever, RUQ pain, jaundice.

#### Reynolds' Pentad

Fever, RUQ pain, jaundice, shock, confusion.

### Investigations

- CBC: elevated WBC + left shift
- may have positive blood cultures
- LFTs: obstructive picture (elevated ALP, GGT and conjugated bilirubin, mild increase in AST, ALT)
- amylase/lipase: rule out pancreatitis
- U/S: intra/extra-hepatic duct dilatation

### Treatment

- initial: NPO, fluid and electrolyte resuscitation,  $\pm$  NG tube, IV antibiotics (treats 80%)
- decompression:
  - ERCP + sphincterotomy: diagnostic and therapeutic
  - PTC with catheter drainage: if ERCP not available or unsuccessful
  - laparotomy with CBD exploration and T-tube placement if above fails
- all patients should also have a cholecystectomy, unless contraindicated

### Prognosis

- suppurative cholangitis mortality rate: 50%

#### Common Bacteria in Biliary Tract

##### KEEPS

*Klebsiella*  
*Enterococcus*  
*E. Coli*, *Enterobacter*  
*Proteus*, *Pseudomonas*  
*Serratia*

## Gallstone Ileus

### Pathogenesis

- repeated inflammation causing a cholecystoenteric fistula (usually duodenal)  $\rightarrow$  large gallstone enters the gut and impacts at or near the ileocecal valve, causing a true bowel obstruction (note: ileus is a misnomer in this context)

### Clinical Features

- crampy abdominal pain, nausea, vomiting (see *Bowel Obstruction*, GS24)

### Investigations

- AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, air in biliary tree (pneumobilia) (40%)
- CT: biliary tract air, obstruction, gallstone in intestine
- Rigler's triad: pneumobilia (air in biliary tree), small bowel obstruction (partial or complete), gallstone (usually in right iliac fossa)

#### Bouveret's Syndrome

Gastric outlet/duodenal obstruction caused by a large gallstone passing through a cholecystogastric or cholecystoduodenal fistula.

#### Rigler's Triad of Gallstone Ileus:

- Pneumobilia
- Small bowel obstruction
- Gallstone

**Treatment**

- fluid resuscitation, NG decompression
- surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
- may close fistula surgically or manage expectantly (can resolve spontaneously)
- cholecystectomy either during enterolithotomy or after recovery if patient experiences gallbladder symptoms

## Carcinoma of the Gallbladder

**Risk Factors**

- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (*Salmonella*, *Helicobacter*), abnormal pancreaticobiliary duct junction

**Clinical Features**

- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of elective cholecystectomies)
- many patients are asymptomatic until late
- local: vague RUQ pain,  $\pm$  palpable RUQ mass
- Courvoisier's gallbladder: an enlarged, often palpable gallbladder in a patient with carcinoma of the head of the pancreas; associated with jaundice due to obstruction of the common bile duct
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

**Investigations**

- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, good for staging, allows sampling of bile for cytology
- abdominal CT: polypoid mass, mural thickening, liver invasion, nodal involvement, distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

**Treatment**

- if carcinoma of the gallbladder is suspected preoperatively, an open cholecystectomy should be considered to avoid tumour seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy, en bloc wedge resection of 3-5 cm underlying liver, dissection of hepatoduodenal lymph nodes

**Prognosis**

- poor 5 yr survival (10%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

## Cholangiocarcinoma

**Definition**

- malignancy of extra- or intrahepatic bile ducts

**Risk Factors**

- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, *Clonorchis sinensis* infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

**Clinical Features**

- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, pale stools
- anorexia, weight loss, RUQ pain, Courvoisier's sign (if CBD obstructed), hepatomegaly
- early metastases are uncommon, but commonly tumour grows into portal vein or hepatic artery
- Klatskin tumour: cholangiocarcinoma located at bifurcation of common hepatic duct

**Investigations**

- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

Obstructive jaundice is the most common presenting symptom for cholangiocarcinoma.

**Courvoisier's Sign**

Palpable, nontender distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger.

## Treatment

- generally palliative
- if resectable: biliary drainage and wide excision margin
  - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
  - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
  - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)

## Prognosis

- radiotherapy useful for additional palliation, chemotherapy may be helpful
- the more proximal to the liver, the worse the prognosis
- overall 5-yr survival: 15%

### Efficacy of Neoadjuvant Chemoradiation, Followed by Liver Transplantation, for Perihilar Cholangiocarcinoma at 12 US Centers

*Gastroenterology* 2012;143:88-98

**Purpose:** To determine the effectiveness of neoadjuvant chemoradiation and liver transplantation for unresectable perihilar cholangiocarcinoma and to determine the appropriateness of the United Network of Organ Sharing/Organ Procurement and Transplantation Network (UNOS/OPTN) criteria for model of end-stage liver disease (MELD) exception for patients with this disease.

**Methods:** Study conducted from 1993-2010 in 12 transplant centers. 287 patients included.

**Results:** Median follow-up was 2.5 yr. 43% of patients (n = 122) died after a median of 1.2 yr from presentation, and of these, 60 died pretransplant. Post-transplant, 43 patients had recurrences and 62 died. Recurrence-free survival at 2, 5, and 10 yr were 78%, 65%, and 59%, respectively. Intention-to-treat survival rates at 2 and 5 yr were 68% and 53%, respectively. 25% of patients left the waiting list after a median of 4.6 mo. The waiting list drop-out rate increased by an average of 11.5% every 3 mo. Patients who received transplantation outside of the criteria for MELD exception or who had a malignancy within 5 yr had significantly worse recurrence-free survival compared to those who met the criteria (HR = 2.98, 95% CI: 1.79, 4.95). Recurrence-free survival at 5 yr was shorter for patients with tumors >3 cm versus ≤3 cm (p < 0.001).

**Conclusions:** Neoadjuvant chemoradiation and liver transplantation are effective treatments for unresectable perihilar cholangiocarcinoma. Furthermore, the UNOS/OPTN criteria for MELD exception appear to be appropriate.

### Ranson's Criteria

#### A. At admission

1. Age > 55 yr
2. WBC > 16 × 10<sup>9</sup>/L
3. Glucose > 11 mmol/L
4. LDH ≥ 350 IU/L
5. AST > 250 IU/L

#### B. During initial 48 h

1. Hct drop > 10%
2. BUN rise > 1.8 mmol/L
3. Arterial PO<sub>2</sub> < 60 mmHg
4. Base deficit > 4 mmol/L
5. Calcium < 2 mmol/L
6. Fluid sequestration > 6 L

#### C. Interpretation

- ≥ 2 = difficult course
- ≥ 3 = high mortality (≥ 15%)

# Pancreas

## Acute Pancreatitis

- see [Gastroenterology](#), G44

### GALLSTONE PANCREATITIS (35% of acute pancreatitis)

#### Pathogenesis

- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

#### Clinical Features (pancreatitis of any etiology)

- pain (epigastric pain radiating to back), nausea, vomiting, ileus, peritoneal signs, jaundice, fever
- Ingelfinger's sign: pain worse when supine, better when sitting forward
- rarely may have coexistent cholangitis or pancreatic necrosis
- Ranson's criteria for determining prognosis of acute pancreatitis (see sidebar)

#### Investigations

- high amylase (higher than alcoholic pancreatitis), lipase, leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), edematous pancreas
- CXR, AXR, CT (if severe to evaluate for complications)

#### Treatment

- supportive
- enteral nutrition
- NPO, hydration, analgesia and antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if failure of conservative management (benefits of early ERCP controversial)
- early ERCP if concomitant cholangitis
- **surgical indications** in acute pancreatitis (rare):
  - debridement and drain placement for necrotizing pancreatitis if refractory to medical management, if septic or in ICU without other sources of sepsis

#### Complications

- pseudocyst (collection of pancreatic secretions >4 wk old surrounded by a defined wall of granulation tissue)
- abscess/infection, necrosis
- splenic/mesenteric/portal vessel thrombosis or rupture
- pancreatic ascites/pancreatic pleural effusion
- diabetes
- ARDS/sepsis/multiorgan failure
- coagulopathy/DIC
- encephalopathy
- severe hypocalcemia

## Chronic Pancreatitis

- see also [Gastroenterology](#), G46

### Surgical Treatment

- treatment is generally medical
- indications for surgery:
  - failure of medical treatment
  - debilitating abdominal pain
  - pseudocyst complications: persistence, hemorrhage, infection, rupture
  - CBD obstruction (e.g. strictures), duodenal obstruction
  - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
  - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
  - anatomical abnormality causing recurrent pancreatitis
- pre-op CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options:
  - endoscopic pancreatic duct decompression: less effective than surgery
  - extracorporeal shockwave lithotripsy: if pancreatic duct stones
  - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery
- surgical options:
  - drainage procedures: only effective if ductal system is dilated
    - ♦ Puestow procedure (lateral pancreaticojejunostomy): improves pain in 80% of patients
  - pancreatectomy: best option in absence of dilated duct
    - ♦ proximal disease: Whipple procedure (pancreaticoduodenectomy) – pain relief in 80%
    - ♦ distal disease: distal pancreatectomy ± Roux-en-Y pancreaticojejunostomy
    - ♦ total pancreatectomy: refractory disease
  - denervation of celiac ganglion and splanchnic nerves
- pseudocyst (often resolve spontaneously with pancreatic rest):
  - cyst wall must be mature prior to drainage (4-6 wk)
  - pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first
  - percutaneous catheter drainage
  - surgical drainage (gold standard):
    - ♦ cystgastrostomy
    - ♦ cystenterostomy
    - ♦ resection
  - endoscopic drainage:
    - ♦ cystgastrostomy
    - ♦ cystduodenostomy
  - consider biopsy of cyst wall to rule out cystadenocarcinoma

The hallmark of chronic pancreatitis is epigastric pain radiating to the back.

## Pancreatic Cancer

### Epidemiology

- fourth most common cause of cancer-related mortality in both men and women in Canada
- M:F = 1.3:1, average age: 50-70

### Risk Factors

- increased age
- smoking: 2-5x increased risk, most clearly established risk factor
- high fat/low fibre diets, heavy alcohol use
- obesity
- DM, chronic pancreatitis
- partial gastrectomy, cholecystectomy
- chemicals: betanaphthylamine, benzidine
- African descent

### Clinical Features

- head of the pancreas (70%):
  - weight loss, obstructive jaundice, vague constant mid-epigastric pain (often worse at night, may radiate to back)
  - painless jaundice (occurs more often with peri-ampullary), Courvoisier's sign (see sidebar GS49)
  - palpable tumour mass → generally incurable
- body or tail of pancreas (30%):
  - tends to present later and usually inoperable
  - weight loss, vague mid-epigastric pain
  - <10% jaundiced
  - sudden onset diabetes

### Investigations

- serum chemistry is non-specific, can have elevated ALP and bilirubin >300 µmol/L
- CA 19-9 (most useful serum marker of pancreatic cancer)
- U/S, contrast CT (also evaluates metastasis and resectability), ERCP, MRI, MRCP

Vague abdominal pain with weight loss ± jaundice in a patient over 50 yr old is pancreatic cancer until proven otherwise.

**Trousseau's Sign**  
Spontaneous peripheral venous thrombosis, often associated with pancreatic and other cancers.

## Pathology

- ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- intraductal papillary mucinous neoplasm (IPMN)
- other: mucinous cystic neoplasm (MCN), acinar cell carcinoma, islet-cell (insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma)
- see *Surgical Endocrinology*, GS60 for insulinoma

## Treatment

- resectable (20% of pancreatic cancer)
  - no involvement of liver, peritoneum or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
  - Whipple procedure (pancreaticoduodenectomy) for cure – 5% mortality
  - distal pancreatectomy ± splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas
- borderline resectable
  - tumours that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
- non-resectable (palliative → relieve pain, obstruction)
  - most body/tail tumours are not resectable (due to late presentation)
  - relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure (choledochoenterostomy + gastroenterostomy)
  - chemotherapy (gemcitabine, folfirinix), radiotherapy – only slightly increase survival

## Prognosis

- most important prognostic indicators are lymph node status, size >3 cm, perineural invasion (invasion of tumour into microscopic nerves of pancreas)
- overall 5-yr survival is 1%
- 20% 5-yr survival following resection
- median survival for unresectable disease: 8-12 mo if locally advanced, 3-6 mo if metastatic

**Table 19. TNM Classification System for Exocrine and Endocrine Tumours of the Pancreas**

Primary Tumour (T)	Regional Lymph Nodes (N)	Distant Metastasis (M)
TX Primary tumour cannot be assessed	NX Regional lymph nodes cannot be assessed	M0 No distant metastasis
T0 No evidence of primary tumour	N0 No regional lymph node metastasis	M1 Distant metastasis
Tis Carcinoma in situ	N1 Regional lymph node metastasis	
T1 Tumour limited to pancreas, <2 cm in greatest dimension		
T2 Tumour limited to pancreas, >2 cm in greatest dimension		
T3 Tumour extends beyond pancreas, no involvement of celiac axis or superior mesenteric artery		
T4 Tumour involves celiac axis or superior mesenteric artery (unresectable)		

### Steps of a Whipple Resection (Pancreaticoduodenectomy):

1. Assessment of metastatic disease (all peritoneal surfaces)
2. Mobilization of the duodenum and head of the pancreas with identification of the superior mesenteric vein
3. Mobilization of the stomach and proximal duodenum, transection of the stomach or proximal duodenum
4. Dissection of the hepatoduodenal ligament with skeletonization of the porta hepatis
5. Cholecystectomy and division of the bile duct
6. Mobilization and division of the proximal jejunum
7. Transection of the pancreatic neck and division of any remaining attachments
8. Reconstruction of gastrointestinal continuity: pancreaticojejunostomy, hepaticojejunostomy, gastro(duodeno)jejunostomy

### Removed:

- Common bile duct
- Gallbladder
- Duodenum
- Pancreatic head
- Distal stomach (sometimes)

**Figure 28. Schematic of Whipple resection, showing the resected components**

# Spleen

## Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr's sign

### Treatment

- non-operative:
  - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
  - hemostatic control
  - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemoperitoneum
- operative:
  - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
  - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
  - total splenectomy if patient unstable or high-grade injury

#### Kehr's Sign

Left shoulder pain due to diaphragmatic irritation from splenic rupture, worsens with inspiration.

## Splenectomy

### Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenia purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenia purpura (TTP), sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIg

### Complications

- short-term:
  - injury to surrounding structures (e.g. gastric wall, tail of pancreas)
  - post-op thrombocytosis, leukocytosis
  - thrombosis of portal, splenic, or mesenteric veins
  - subphrenic abscess
- long-term:
  - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr old)
    - ♦ 50% mortality
    - ♦ prophylaxis with vaccinations, ideally 2 wk pre- or post-op (*pneumococcal*, *H. influenzae* and *meningococcus*)
    - ♦ liberal use of penicillin especially in children <6 yr old
  - splenosis: intra-abdominal "seeding" of splenic tissue during removal

## Breast

Figure 29. Anatomy of the breast

### Levels of Axillary Lymph Nodes

**Level I:** lateral to pectoralis minor

**Level II:** deep to pectoralis minor

**Level III:** medial to pectoralis minor

(Higher level = worse prognosis)

## Benign Breast Lesions

### NON-PROLIFERATIVE LESIONS

- also known as fibrocystic change, chronic cystic mastitis, mammary dysplasia
- benign breast condition characterized by fibrous and cystic changes in the breast
- no increased risk of breast cancer
- age 30 to menopause (and after if HRT used)
- clinical features:
  - breast pain, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, nipple discharge (straw-like, brown or green)
- treatment:
  - evaluation of breast mass and reassurance
  - if >40 yr old: mammography every 3 yr
  - no strong evidence for avoidance of xanthine-containing products (coffee, tea, chocolate, cola)
  - analgesia (ibuprofen, ASA)
  - for severe symptoms: OCP, danazol, bromocriptine

### DDx for Breast Mass

#### Benign:

- Fibrocystic changes
- Fibroepithelial lesions (fibroadenoma most common; benign phyllodes also)
- Fat necrosis
- Papilloma/papillomatosis
- Galactocele
- Duct ectasia
- Ductal/lobular hyperplasia
- Sclerosing adenosis
- Lipoma
- Neurofibroma
- Granulomatous mastitis (e.g. TB, granulomatosis with polyangiitis, sarcoidosis)
- Abscess
- Silicone implant

#### Malignant:

- Breast ca (likely invasive, DCIS rarely forms a breast mass)
- Malignant phyllodes
- Angiosarcoma (rare)

### PROLIFERATIVE LESIONS – No Atypia

#### Fibroadenoma

- most common benign breast tumour in women under age 30
- risk of subsequent breast cancer is increased only if fibroadenoma is complex, there is adjacent atypia or a strong family history of breast cancer
- clinical features:
  - nodules: smooth, rubbery, discrete, well-circumscribed, non-tender, mobile, hormone dependent
  - unlike cysts, needle aspiration yields no fluid
- investigations:
  - core or excisional biopsy required
  - ultrasound and FNA alone cannot differentiate fibroadenoma from Phyllodes tumour
- treatment:
  - generally conservative: serial observation
  - consider excision if size 2-3 cm and growing on serial ultrasound (q6mo x 2 yr is usual follow-up), if symptomatic or patient preference

#### Intraductal Papilloma

- solitary intraductal benign polyp
- present as nipple discharge (most common cause of spontaneous, unilateral, bloody nipple discharge), breast mass, nodule on U/S
- can harbour areas of atypia or DCIS
- treatment: excision of involved duct to ensure no atypia

**Ductal Hyperplasia Without Atypia**

- increased number of cells within the ductal space
- cells retain benign cytology
- no treatment required
- slightly increased cancer risk if moderate or florid hyperplasia

**PROLIFERATIVE LESIONS – With Atypia****Atypical Hyperplasias**

- can involve ducts (ductal hyperplasia with atypia) or lobules (lobular hyperplasia with atypia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

**OTHER LESIONS****Fat Necrosis**

- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction,  $\pm$  tenderness
- regress spontaneously, but complete imaging  $\pm$  biopsy to rule out carcinoma

**Mammary Duct Ectasia**

- obstruction of a subareolar duct leading to duct dilation, inflammation, and fibrosis
- may present with nipple discharge, bluish mass under nipple, local pain
- risk of secondary infection (abscess, mastitis)
- resolves spontaneously

**Montgomery Tubercle**

- Montgomery tubercles (or Morgagni tubercles) are papular projections at the edge of the areola
- obstruction of these glands can lead to inflammation or cystic collections (cyst of Montgomery aka retroareolar cyst)
- if signs of secondary infection, start treatment for mastitis
- resolves spontaneously in weeks to years

**Abscess**

- lactational (see [Obstetrics](#), OB51) vs. periductal/subareolar
- unilateral localized pain, tenderness, erythema, subareolar mass, nipple discharge, nipple inversion
- rule out inflammatory carcinoma, as indicated
- treatment: initially broad-spectrum antibiotics and I&D, if persistent total duct excision (definitive)
- if mass does not resolve: U/S to assess for presence of abscess, core biopsy to exclude cancer, consider MRI

## Breast Cancer

**Epidemiology**

- 2nd leading cause of cancer mortality in women (1st is lung cancer)
- 1/9 of women in Canada will be diagnosed with breast cancer in their lifetime
- 1/27 of women in Canada will die from breast cancer

**Risk Factors**

- gender (99% female)
- age (80% >40 yr old)
- important risk factors are prior history of breast cancer and/or prior breast biopsy (regardless of pathology)
- 1st degree relative with breast cancer (greater risk if relative was premenopausal)
- increased risk with high breast density, nulliparity, first pregnancy >30 yr old, menarche <12 yr old, menopause >55 yr old
- decreased risk with lactation, early menopause, early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT

Gender followed by age are the two greatest risk factors for breast cancer.

## Investigations

- mammography
  - indications:
    - ♦ screening refer to [Family Medicine](#), FM3
  - findings indicative of malignancy:
    - ♦ mass that is poorly defined, spiculated border
    - ♦ microcalcifications
    - ♦ architectural distortion
    - ♦ interval mammographic changes
    - ♦ normal mammogram does not rule out suspicion of cancer based on clinical findings
- other radiographic studies:
  - U/S: differentiate between cystic and solid
  - MRI: high sensitivity, low specificity
  - galactogram/ductogram (for nipple discharge): identifies lesions in ducts
  - metastatic workup as indicated (usually after surgery or if clinical suspicion of metastatic disease): bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), head CT (only if specific neurological symptoms)

Any palpable dominant breast mass requires further investigation.

Diagnostic mammography is indicated in all patients, even in women <50 yr old.

## Diagnostic Procedures

- needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
- U/S or mammography guided core needle biopsy (most common)
- fine needle aspiration (FNA): for palpable solid masses; need experienced practitioner for adequate sampling
- excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

## Genetic Screening

- consider testing for BRCA1/2 if:
  - patient diagnosed with breast AND ovarian cancer
  - strong family history of breast/ovarian cancer
  - family history of male breast cancer
  - young patient (<35 yr old)
  - bilateral breast cancer in patients <50 yr old

## Staging (see Table 20)

- clinical:
  - tumour size by palpation, mammogram
  - nodal involvement by palpation
  - metastasis by physical exam, CXR and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-op if node-positive disease)
- pathological:
  - tumour size
  - grade: modified Bloom and Richardson score (I to III) – histologic, nuclear and mitotic grade
  - number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, sentinel node positive/negative
  - estrogen receptor (ER) + progesterone receptor (PR) testing
  - Her2Neu receptor testing
  - margins: negative, <1 mm, positive
  - lymphovascular invasion (LVI)
  - extensive in situ component (EIC): DCIS in surrounding tissue
  - involvement of dermal lymphatics (inflammatory) – automatically Stage IIIB

**Table 20. Staging of Breast Cancer (American Joint Committee on Cancer)**

Stage	Tumour	Nodes (regional) (clinical)	Metastasis	Survival (5-yr)
0	in situ	None	None	99%
I	<2 cm	None	None	94%
II A	<2 cm	Mobile ipsilateral	None	85%
II B	2-5 cm or >5 cm	None or mobile ipsilateral None	None None	70%
III A	Any size	Fixed ipsilateral or internal mammary	None	52%
III B	Skin/chest wall invasion	Any	None	48%
III C	Any size	Ipsilateral infraclavicular/internal mammary plus axillary nodes; ipsilateral supraclavicular node(s) ± axillary nodes	None	33%
IV	Any	Any	Distant	18%

Favourable Features	Unfavourable Features
<ul style="list-style-type: none"> <li>• &lt;2 cm</li> <li>• Grade I (low grade)</li> <li>• Node negative</li> <li>• ER positive</li> <li>• Mucinous pattern</li> </ul>	<ul style="list-style-type: none"> <li>• &gt;5 cm</li> <li>• Grade III (high grade)</li> <li>• Node positive</li> <li>• ER negative</li> <li>• Inflammatory cancer</li> <li>• Her2Neu positive</li> <li>• Positive margins</li> <li>• LVI</li> <li>• EIC</li> <li>• Dermal lymphatics involved</li> </ul>

## Pathology

- non-invasive (cannot penetrate basement membrane):
  - ductal carcinoma *in situ* (DCIS):
    - ♦ proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
    - ♦ 80% non-palpable, detected by screening mammogram
    - ♦ risk of invasive ductal carcinoma in same breast up to 35% in 10 yr
    - ♦ treatment:
      - lumpectomy with wide excision margins + radiation (5-10% risk invasive cancer)
      - mastectomy if large area of disease, high grade or multifocal (risk of invasive cancer reduced to 1%)
      - possibly tamoxifen as an adjuvant treatment
      - 99% 5-yr survival
  - lobular carcinoma *in situ* (LCIS):
    - ♦ neoplastic cells completely contained within breast lobule
    - ♦ no palpable mass, no mammographic findings, usually incidental finding on breast biopsy for another indication
    - ♦ treatment
      - clinical follow-up
      - chemoprevention (tamoxifen)
      - surgery (uncommon)
    - ♦ not a precursor lesion, but considered a risk factor for breast cancer development
- invasive:
  - invasive ductal carcinoma (most common 80%):
    - ♦ originates from ductal epithelium and infiltrates supporting stroma
    - ♦ characteristics: hard, scirrhous, infiltrating tentacles, gritty on cross-section
  - invasive lobular carcinoma (8-15%):
    - ♦ originates from lobular epithelium
    - ♦ 20% bilateral (i.e. more often than infiltrating ductal carcinoma)
    - ♦ does not form microcalcifications, harder to detect mammographically (may benefit from MRI)
  - Paget's disease (1-3%):
    - ♦ ductal carcinoma that invades nipple with scaling, eczematoid lesion
  - inflammatory carcinoma (1-4%):
    - ♦ ductal carcinoma that invades dermal lymphatics
    - ♦ most aggressive form of breast cancer
    - ♦ clinical features: erythema, skin edema, warm, swollen and tender breast ± lump
    - ♦ peau d'orange indicates advanced disease (IIIB-IV)
  - male breast cancer (<1%):
    - ♦ most commonly invasive ductal carcinoma
    - ♦ often diagnosed at later stages
    - ♦ stage-for-stage similar prognosis to breast cancer in females
    - ♦ consider genetic testing
  - sarcomas: rare
    - ♦ most commonly Phyllodes tumour, a variant of fibroadenoma with potential for malignancy
    - ♦ can also be angiosarcomas – after previous radiation
  - lymphoma: rare
  - other: papillary, medullary, mucinous, tubular cancers
    - ♦ generally better prognosis

## Treatment

**Table 21. Breast Cancer Treatment by Stage**

Stage	Primary Treatment Options	Adjuvant Systemic Therapy
0 ( <i>in situ</i> )	BCS + radiotherapy BCS alone if margins > 1 cm and low nuclear grade Mastectomy* ± SLNB	None
I	BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SLNB	May not be needed; discuss risks/benefits of chemotherapy and tamoxifen
II	BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SLNB	Chemotherapy for premenopausal women or postmenopausal and estrogen receptor (ER) negative, follow by tamoxifen if ER positive
III	Likely mastectomy + axillary node dissection + radiotherapy	Neoadjuvant therapy may be considered i.e. preoperative chemotherapy and/or hormone therapy. Adjuvant radiation and chemotherapy may also be appropriate (i.e. post-op)
Inflammatory	Likely mastectomy + axillary node dissection + radiotherapy	Neoadjuvant therapy
IV	Surgery as appropriate for local control	Primary treatment is systemic therapy i.e. chemotherapy and/or hormone therapy

BCS = breast-conserving surgery; SLNB = sentinel lymph node biopsy

\*If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient's preference since choice of local treatment does not significantly affect survival if local control is achieved

### Diagnosis of Breast Lesions: Fine-Needle Aspiration Cytology or Core Needle Biopsy?

#### A Review

*J Clin Pathol* 2012; 65:287-292

#### CNB

- High sensitivity (85%-100%) and specificity (86%-100%)
- High success rates for diagnosis of malignancy for palpable lesions (97%), non-palpable lesions (94%), and lesions <10 mm (90%)
- More accurate for histologic and immunohistochemistry examinations, and differentiation between *in situ* and invasive malignancies
- Reliable for testing of ER, PR, and HER2 status and proliferation assessment
- More painful procedure

#### FNAC

- Variable sensitivity (35%-95%) and specificity (48%-100%)
- Quality correlates with skill of aspirator
- Lower success rates for diagnosis of malignancy for palpable lesions (75-90%), non-palpable lesions (34-58%), and lesions <10 mm (50%)
- High rates of insufficient sampling for lesions >40 mm or calcified lesions
- Quick to perform
- Low technical costs

**Conclusions:** FNAC is preferable for palpable, low malignancy-risk lesions. However, for potential malignancies, CNB is advantageous with respect to prognostication and prediction and is likely cost-effective in the long-term.

Breast conserving surgery can be offered to most women with stage I/II disease.

### Primary Surgical Treatment

- breast-conserving surgery (BCS): lumpectomy with wide local excision
  - for treatment of stage I and II disease
  - must be combined with radiation for survival equivalent to mastectomy
  - contraindications:
    - ♦ high risk of local recurrence: extensive malignant-type calcifications on mammogram, multifocal primary tumours, or failure to obtain tumour-free margins after re-excision
    - ♦ contraindications to radiation therapy (pregnancy, previous radiation, collagen vascular disease)
    - ♦ large tumour size relative to breast
- mastectomy
  - radical mastectomy (rarely done anymore): removes all breast tissue, skin, pectoralis muscle, axillary nodes
  - modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
  - simple mastectomy: removes all breast tissue and skin
  - see [Plastic Surgery](#), PL32 for breast reconstruction
- axillary lymph node dissection (ALND)
  - performed if SLNB is positive or nodes are clinically concerning
  - risk of arm lymphedema (10-15%), decreased arm sensation, shoulder pain
- sentinel lymph node biopsy (SLNB)
  - technetium-99 ± blue dye injected at tumour site prior to surgery to identify sentinel node(s)
  - intraoperative frozen section
  - proceed with ALND if positive
  - 5% false negative rate

### Adjuvant/Neoadjuvant

- radiation
  - indications:
    - ♦ decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy (if >4 nodes positive or tumour >5 cm)
    - ♦ inoperable locally advanced cancer
  - axillary nodal radiation may be added if nodal involvement
- hormonal
  - indications:
    - ♦ ER positive plus node-positive or high-risk node-negative
    - ♦ palliation for metastases
  - tamoxifen if premenopausal or aromatase inhibitors (e.g. anastrozole)
  - ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), androgens (e.g. fluoxymesterone) are other options
- chemotherapy
  - indications:
    - ♦ ER negative plus node-positive or high-risk node-negative
    - ♦ ER positive and young age
    - ♦ stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
    - ♦ palliation for metastatic disease

### Post-Treatment Follow-up

- visits q3-6mo x 2 yr and annually thereafter (frequency is controversial)
- annual mammography; no other imaging unless clinically indicated
- psychosocial support and counseling

### Local/Regional Recurrence

- recurrence in treated breast or ipsilateral axilla
- 1% per year up to maximum of 15% risk of developing contralateral malignancy
- 5x increased risk of developing metastases

### Metastasis

- bone > lungs > pleura > liver > brain
- treatment is palliative: hormone therapy, chemotherapy, radiation

#### Twenty-year Follow-up of a Randomized Study comparing Breast-conserving Surgery with Radical Mastectomy for Early Breast Cancer

*NEJM* 2002;16:1227-1232

**Background:** Women enrolled in a randomized trial to compare the efficacy of radical mastectomy (RM) with that of breast-conserving surgery (BCS) were followed over a 20-yr period for long-term outcomes including disease recurrence and survival.

**Methods:** From 1973-1980, 701 women with breast cancers measuring <2 cm in diameter were randomly assigned to undergo RM (n=349) or BCS followed by radiotherapy to the ipsilateral breast (n=352).

**Results:** Rates of ipsilateral disease recurrence were lower in patients treated with RM compared to BCS (crude cumulative incidence 2.3% versus 8.8% after 20 yr,  $P<0.001$ ). However, there was no significant difference in rates of contralateral breast malignancies, metastatic spread, or second primary malignancies between the two groups. All-cause mortality rates were 41.7% in the BCS group and 41.2% in the RM group ( $P=1.0$ ), with mortality rates due to breast cancer of 26.1% and 24.3% respectively ( $P=0.8$ ).

**Conclusion:** The long-term survival rate among patients treated with breast-conserving surgery and adjuvant radiotherapy is the same as that among patients treated with radical mastectomy.

There is no survival benefit of mastectomy over lumpectomy plus radiation for stage I and II disease.

# Surgical Endocrinology

## Thyroid and Parathyroid

- see [Endocrinology](#), E20 and [Otolaryngology](#), OT34-OT37

### Thyroidectomy

- indications: thyroid cancer, symptomatic thyroid mass or goiter, medically refractory Graves' or hyperthyroidism
- contraindications: uncontrolled severe hyperthyroidism (i.e. Graves') due to risk of intraoperative or postoperative thyroid storm
- preoperative workup: thyroid ultrasound for thyroid nodules, fine needle aspiration for large nodules, ultrasound of the neck for lesions suspicious for papillary or medullary thyroid cancer, CT neck useful to rule out extension, vocal cord function
- complications: hypocalcemia secondary to hypoparathyroidism, recurrent/superior laryngeal nerve injury, neck hematoma, infection, thyrotoxic storm

### Parathyroidectomy

- indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum Ca, marked hypercalciuria, Cr clearance less than 30% normal, bone density reduction with T score less than 2.5, age less than 50)
- contraindications: familial hypocalciuric hypercalcemia
- preoperative workup:  $^{99m}\text{Tc}$  sestamibi scanning,  $\pm$  SPECT or CT, ultrasound
- complications: recurrent/superior laryngeal nerve injury, postoperative hypocalcemia, infection, bleeding

## Adrenal Gland

- see [Endocrinology](#), E29
- functional anatomy:
  - cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), reticularis (sex steroids)
  - medulla: catecholamines (epinephrine, norepinephrine)
- types: functional (e.g. Cushing's syndrome, Conn's syndrome) or non-functional

### INCIDENTALOMA

- adrenal mass discovered by investigation of unrelated symptoms

### Epidemiology

- benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
- metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, kidney
- peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

### Investigations

- MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
- functional studies:
  - pheochromocytoma: 24 h urine epinephrine, norepinephrine, metanephrine, normetanephrine, VMA (vanillylmandelic acid)
  - Cushing's: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
  - aldosteronoma: electrolytes, aldosterone:renin level, saline suppression test if appropriate
  - adrenal androgens: 17-OH progesterone, DHEAS
- FNA biopsy: if suspect metastasis to adrenal (must exclude pheochromocytoma first)
  - indicated if history of cancer or patient is smoker
- iodocholesterol scintigraphy: may distinguish benign vs. malignant disease

### Treatment

- functional tumour: resect
- non-functioning tumour:
  - >4 cm: resect
  - <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

## Pancreas

### INSULINOMA

- tumour that secretes insulin
- most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

#### Clinical Features

- Whipple's triad
- palpitations, trembling, diaphoresis, confusion, seizure, personality changes

#### Investigations

- bloodwork: decreased serum glucose and increased serum insulin and C-peptide
- U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

#### Treatment

- only 10% are malignant
- enucleation of solitary insulinomas may be done endoscopically
- tumours >2 cm located close to the pancreatic duct may require pancreatectomy or pancreaticoduodenectomy

#### Whipple's Triad

- Symptomatic fasting hypoglycemia
- Serum glucose <50 mg/dL
- Relief of symptoms when glucose is administered

### GASTRINOMA

- tumour secreting gastrin; cause of Zollinger-Ellison syndrome

#### Clinical Features

- abdominal pain, peptic ulcer disease, severe esophagitis
- multiple ulcers in atypical locations refractory of antacid therapy

#### Investigations

- bloodwork: serum gastrin levels (usually >1000 pg/mL), secretin stimulation test
- U/S, CT: 70-90% found in Passaro's triangle (head of pancreas, duodenum, lymphatic bed posterior and superior to the duodenum)
- octreotide scintigraphy scan

#### Treatment

- 50% are malignant
- surgical resection of tumour dependent on location
- non-surgical treatment: chemotherapy, somatostatin analogues, interferon, chemoembolization
- if inoperable vagotomy can be performed for symptomatic control

### VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOUR

- tumour secreting vasoactive intestinal peptide (VIP); commonly located in the distal pancreas and most are malignant when diagnosed

#### Clinical Features

- severe watery diarrhea causing dehydration, weakness, electrolyte imbalance

#### Investigations

- bloodwork: serum VIP levels
- U/S, CT

#### Treatment

- somatostatin analogues
- surgical resection/palliative debulking

# Pediatric Surgery

Table 22. Pediatric Surgery

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical	Investigations	Treatment	Prognosis
<b>Hydrocele (see Urology, U28)</b> 	1-2% of live births Present at birth, majority close spontaneously by 1 yr M:F = 6:1 Prematurity	<b>Communicating hydroceles:</b> processus vaginalis fails to close with small opening for fluid to move freely between peritoneal cavity through patent processus (if opening progresses to allow passage of intestine, it is a hernia)  <b>Noncommunicating hydroceles:</b> fluid trapped in tunica vaginalis; in older children, may be secondary to testicular pathology (reactive hydrocele)	Painless scrotal mass Communicating hydroceles increase in size with standing or Valsalva, may be absent in the morning and large in the evening	Transillumination suggests hydrocele Silk glove sign: gently palpating hydrocele sac over pubic tubercle feels like rubbing silk on silk	U/S if suspect pathology	Most resolve spontaneously by 1 yr Surgical repair if: – Persistence > 2 yr – Pain – Fluctuating in size which suggests communication – Cosmetic reasons – Infection	<2% recurrence
<b>Hypertrophic Pyloric Stenosis</b>	0.03-1.0% of live births Can present at 1-20 wk, most commonly at 6-8 wk M:F = 4:1 Early erythromycin exposure (<13 d old)	Acquired pyloric circular muscle hypertrophy results in gastric outlet obstruction Hypovolemia caused by emesis of gastric content causes hypochloremic hypokalemic metabolic alkalosis. Electrolyte exchange based volume retention in kidneys results in paradoxical aciduria	Projectile non-bilious vomiting Vomiting 30-60 min after feeds Hungry after vomiting Dehydration (variable severity)	Smooth oblong 1-2 cm mass palpable above umbilicus, "olive" Visible left-to-right gastric contraction "waves" after feeding	Electrolytes (assess hypochloremia, dehydration) U/S shows pyloric length > 14 mm, muscle thickness > 4 mm Upper GI series necessary only when U/S unavailable or non-diagnostic will show "string sign"	Fluid resuscitate with normal saline, correct electrolyte and acid/base abnormalities with D5, 1/2NS + 20 mEq/L KCl at maintenance rate. NG tube decompression unnecessary Pyloromyotomy, open (Ramstedt vs. transumbilical or laparoscopic approach) Alternative therapies such as TPN/wait or atropine impractical due to long time course of effect	Pyloromyotomy curative
<b>Congenital Diaphragmatic Hernias</b> 3 types: – Posterolateral (Bochdalek) – Left-sided, 85% – Right-sided, 13% – Bilateral, rare, often fatal – Anterior (Morgagni) – Hiatus	1 in 2000 to 5000 live births Presents within hours of life although some cases of delayed presentation M = F >10% are associated with other congenital anomalies Prenatal diagnosis common	<b>Left-sided:</b> small bowel, large bowel, stomach and solid viscera (spleen, left lobe of liver) herniate into thorax  <b>Right-sided:</b> liver, large bowel herniate into thorax Pulmonary hypoplasia Pulmonary hypertension	Early respiratory distress Cyanosis Scaphoid abdomen Prenatal diagnosis	Decreased air entry ± bowel sounds in the chest Displaced heart sounds	Prenatal US/MRI ABG CXR (bowel loops in hemithorax, shifted heart) Echocardiography Genetic consultation if warranted	Intubate Orogastric suction Period of respiratory stabilization due to associated pulmonary hypoplasia (may require extracorporeal membrane oxygenation). Surgical repair after stable by hernia reduction and closure of diaphragmatic defect – open vs. thoracoscopic vs. laparoscopic with or without prosthetic or muscular patch depending on size of defect	Later presentations have better outcomes Hearing deficit (40%) Associated GERD MSK defects – chest wall and scoliotic defects a potential complication of thoracotomy.  Need for long term surveillance for potential recurrence Failure to thrive Chronic lung disease if severe hypoplasia

**Hypertrophic Pyloric Stenosis**  
 Non-bilious emesis in infant is the classic presentation.

**Table 22. Pediatric Surgery** (continued)

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical	Investigations	Treatment	Prognosis
<b>Meckel's Diverticulum</b> Most common remnant of vitelline duct that connects yolk sac with primitive midgut	1-3% of population M:F = 3:1 Present most frequently first 5 yr of life Symptomatic in 2% of cases	Failure of vitelline duct to regress 5-7 wk in utero; 50% contain heterotopic tissue (e.g. gastric mucosa, ectopic pancreas); other associated anomalies include omphalomesenteric fistula, umbilical sinus, umbilical cyst, fibrous band	Bright red blood per rectum (heterotopic gastric mucosa in Meckel's causing mucosal ulceration and bleeding in adjacent small bowel mucosa) Abdominal sepsis (Meckel's diverticulitis ± perforation) Small bowel volvulus around fibrous band	Tenderness (lower abdomen) near umbilicus	AXR Meckel scan: scan for ectopic gastric mucosa with technetium Tc99m pertechnetate IV (sensitivity 85%, specificity 95%)	Stabilize, resection by laparotomy or laparoscopy ± incidental appendectomy	Resection curative
<b>Malrotation</b>	1:500 live births 1/3 present by 1 wk of age, 3/4 by 1 mo of age, 90% by 1 yr of age M:F = 1:1; higher incidence among patients with cardiac anomalies, heterotaxy syndromes	Failure of gut to normally rotate around superior mesenteric artery with associated abnormal intestinal attachments and anatomic positions Represent a spectrum of rotational abnormalities including complete non-rotation (which is not at high risk for volvulus)	Bilious emesis is THE cardinal sign, especially if abdomen nondistended. If bilious emesis in ill child with distend abdomen, consider surgical exploration to rule out volvulus. Rectal bleed (late/o minous signs) Intermittent symptoms	Bilious drainage from NG tube Tachycardic, pale Diaphoretic Flat abdomen Tenderness	AXR: obstruction of proximal small bowel, double-bubble sign, intestinal wall thickened Immediate UGI: dilated duodenum, duodenojejunal segment (Ligament of Treitz) right of midline and not fixed posteriorly over spinal column, "corkscrew" sign indicating volvulus U/S: "whirlpool" sign, abnormal SMA/SMV relationship indicates UGI to rule out rotational anomalies	IV antibiotics Fluid resuscitation <b>EMERGENT LAPAROTOMY</b> Ladd procedure: counterclockwise reduction of midgut volvulus, division of Ladd's bands, division of peritoneal attachments between cecum and abdominal wall that obstruct duodenum, broadening of the mesentery (open folded mesentery like a book and divide congenital adhesions), ± appendectomy Positioning the bowel into non-rotation (small bowel in right abdomen, large bowel in left abdomen)	Mortality related to length of bowel loss: 10% necrosis – 100% survival rate, 75% necrosis – 35% survival rate Recurrence 2-6%
<b>Gastroschisis</b>	1:2000 live births Antenatal diagnosis common Increases with younger maternal age and associated with IUGR M:F = 1:1	Defect of abdominal wall, with free extrusion of intestine into amniotic cavity No specific environmental factor identified Defect in embryogenesis unclear	Not associated with genetic syndromes 10% with intestinal atresia Some cases associated with short bowel syndrome due to antenatal volvulus and necrosis of herniated bowel	Hollow viscera (stomach, small and large bowels) Defect lateral to cord (usually right) Bowel may be inflamed, thickened, matted, foreshortened Defect size variable	Prenatal ultrasound, elevated MS-AFP	NG decompression IV fluids IV antibiotics Keep viscera moist and protected until surgical reduction with primary abdominal closure or staged closure with silo May have bowel dysmotility requiring motility medications	> 90% survival rate
<b>Omphalocele</b>	1:5000 live birth Antenatal diagnosis common Lower gestational age Increased maternal age M:F = 1.5:1	Defect of abdominal wall, with extrusion of sac covered viscera (amnion, Wharton's jelly, peritoneum) Duhamel's theory – failure of body wall morphogenesis	Associated with genetic syndromes 30-70% (e.g. Pentalogy of Cantrell, congenital heart disease, Beckwith-Wiedemann syndrome) Associated pulmonary hypoplasia	Hollow viscera (stomach, small and large bowels, often liver) Cord on the sac	Prenatal ultrasound Elevated MS-AFP	NG decompression IV fluids IV antibiotics Small defect (<2 cm): Primary closure Medium (2-4 cm) and large (> 4 cm) defects best treated with silver sulfadiazine to promote epithelialization coupled with compression dressing to allow gradual reduction, followed by future repair with or without mesh	40-70% survival rate Higher survival rates most likely related to antenatal mortality of fetuses with giant omphaloceles

Bilious vomiting in infant is a life-threatening emergency secondary to midgut volvulus until proven otherwise.

#### Rule of 2s for Meckel's Diverticulum

- 2% of the population
- 2:1 male-to-female ratio
- Symptomatic in 2% of cases
- Found within 2 feet (10-90 cm) of the ileocecal (IC) valve
- 2 inches in length
- 2 inches in diameter
- 2 types of tissue (gastric, pancreatic)
- Often present by 2 yr of age

Table 22. Pediatric Surgery (continued)

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical	Investigations	Treatment	Prognosis
<b>Umbilical Hernias</b>	Incidence 2-14% Increases with prematurity Decreases with increasing age	Incomplete closure of peritoneal and fascial layers within umbilicus by 5 yr	Majority asymptomatic Majority spontaneously resolve by age 5 Incarceration prior to age 5 very rare Most symptoms occur in late adolescence or adulthood	Protrusion from umbilicus Important to differentiate from less common abdominal wall hernias that don't spontaneously resolve (e.g. epigastric hernias) Most umbilical fascial defects > 1.5 cm in infancy will not close spontaneously	None if uncomplicated	Repair if not spontaneously closed by age 5 Earlier repair of large "proboscoid" hernias with extensive skin stretching may be warranted for cosmetic reasons Simple primary closure of fascial defect	Low risk of recurrence
<b>Intestinal Atresia</b>	Incidence 2-14% May be antenatally diagnosed by dilated bowel loops or "double-bubble" sign on x-ray for duodenal atresia Decreasing with increasing age	Duodenal – failure of bowel to recanalize after endodermal epithelium proliferation (wk 8-10) Jejunum/ileal – acquired as result of vascular disruption → ischemic necrosis → resorption of necrotic tissue → blind distal and proximal ends Colon – mechanism unknown, thought to be similar to small bowel atresia	Gastric distension and vomiting (usually bilious) Duodenal – may be associated with other anomalies (tracheoesophageal fistula, cardiac, renal and vertebral anomalies), 24-28% have Down syndrome Jejunum/ileal – within 2 d of birth, may be associated with cystic fibrosis Colonic – within 3 d of birth	Complete physical Special notice to abdominal exam Perineum and anus Include evaluation of respiratory distress and signs of volume depletion Congenital anomalies Jaundice	Contrast enema ± UGI with small bowel follow through (SBFT) Group and screen INR and PTT if for surgery	NPO NG tube decompression Fluid resuscitate TPN Broad spectrum antibiotics Duodenal – duodenoduodenostomy or duodenojejunostomy Jejunum/ileal – primary anastomosis; or if atresia associated with short bowel then may create end stoma or defer surgery for bowel lengthening procedures Colonic – primary anastomosis	Long term survival Duodenal – 86% Jejunum/ileal – 84% Colonic – 100%
<b>Hirschsprung's Disease</b>	1:5000 births M:F = 3:1-4:1, approaches 1:1 when whole colon involved Can have aganglionosis of small bowel as well Familial Hirschsprung's in <5% of cases	Defect in migration of neurocrest cells to intestine resulting in aganglionic bowel that fails to peristalt and internal sphincter that fails to relax (internal anal sphincter achalasia) causing functional and partial mechanical obstruction, respectively; always starts in the rectum and variable involvement proximally; RET mutation	Failure to pass meconium spontaneously within 48 h of life is the classic history (95% of normal children should pass meconium within 24 h, and the remaining 5% within 48 h). Symptoms of bowel obstruction: abdominal distension, constipation, bilious emesis Enterocolitis/sepsis Failure to thrive	± abdominal distension Squirt/blast sign	Rectal biopsy (gold standard) – look for aganglionosis and neural hypertrophy AXR Contrast enema to find narrow rectum and transition zone. Anal manometry unreliable in infants – classic finding is absence of rectoanal inhibitory reflex	Surgical resection of aganglionic intestinal segment and anastomosis of remaining intestine to anus Either in newborn period or staged if extensive aganglionosis	Most have normal/near-normal anorectal function Complications: Fecal incontinence and constipation, post-operative enterocolitis (medical emergency if progresses to sepsis)
<b>Cryptorchidism</b>	2-5% of term males – most of these descend spontaneously by 6 mo of age 1% of males do not spontaneously descend	Idiopathic Descent is mediated by descendin which is created in response to testosterone Descent usually begins at 28 wk	Palpable testicle within inguinal canal or testicle which can be milked down into scrotum (called retractile testis) Occasionally no palpable testis as it is intra-abdominal Consider other congenital abnormalities	Bi-annual testicular exam with palpation Distinguish truly undescended testis from retractile testis (which is "high" testis due to hyperactive cremasteric muscles)	Depends on age of presentation U/S or MRI exam if no palpable testis Older child: LH, FSH, MIS, hCG stimulation test for gonadotropin production Infant: U/S, FSH, LH, karyotype, MIS, 17-Hydroxyprogesterone	hCG to stimulate testosterone production and descent Orchidopexy – especially if undescended by age 6 mo-2 yr	Orchidopexy Decreased risk of torsion and blunt trauma to testicle No effect on malignant potential of testicle Descent can preserve spermatogenesis if performed by 1 yr of age 1/1000 risk for testicular cancer (population risk is 1/4000)

Table 22. Pediatric Surgery (continued)

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical	Investigations	Treatment	Prognosis
<b>Intussusception</b>	Most common cause of bowel obstruction between the ages of 6-36 mo 26/100,000 newborns More common males (3:2) Pathologic lead points: enlarged Peyer's patches due to viral infections of the GI tract, polyps, Meckel's diverticulum CF, lymphoma, IBD may increase risk	Idiopathic is most common Usually starts at ileocecal junction Telescoping of bowel into itself causing an obstruction and vascular compromise	Acute onset of abdominal pain which is classic episodic "colicky" pain Vomiting ± bilious Abdominal mass Currant-jelly stool suggests mucosal necrosis and sloughing	Abdominal exam Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness Signs of bowel obstruction- distended abdomen Look for localized peritonitis which suggests transmural ischemia	AXR for signs of bowel obstruction or perforation U/S if suspect pathology	If peritonitis, then consider operative management Non-operative management involves reduction via air contrast enema Operative reduction can be done open or laparoscopically Resection of involved colon if failure to reduce or bowel appears compromised	10% recurrence rate If recurrent = more likely non-idiopathic In successfully reduced by enema in older children allow 2 wk resolution of edema then perform SBT to rule out pathologic lead points
<b>Tracheoesophageal Fistula (TEF)</b>	1:3000-1:4500	Associated anomalies in 50%: VACTERL association (see <a href="#">Pediatrics</a> , P41) 	Varies with type of fistula May have history of maternal polyhydramnios, May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning,		X-ray: anatomic abnormalities, NG tube curled in pouch	Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth	Complications: pneumonia, sepsis, reactive airways disease. Following repair: esophageal stenosis and strictures at repair site, gastroesophageal reflux and poor swallowing (i.e. dysphagia, regurgitation)
<b>Inguinal Hernias</b>	5% of all term newborns 2x risk and more likely bilateral if pre-term More common in males (4:1) Low birth weight increases risk 1/5 inguinal hernias will become incarcerated if patient is <1 yr old Incarceration is more common in females Associated with other conditions: androgen insensitivity, connective tissue diseases	All infant hernias are indirect: Descent of intra-abdominal contents through the internal inguinal ring through a patent tunica vaginalis	Most common presentation: painless intermittent mass in groin, may also note extension into scrotum (scrotal mass in absence of inguinal mass is a hydrocele) If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted	Palpate for "bag of worms" suggests possible testicular varicocele Biannual testicular exam + palpation along inguinal canal to evaluate for any masses "Silk sign" – palpable thickening of cord Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen Must always try reduction to confirm that hernia is not incarcerated	Physical exam is gold standard U/S only if physical exam uncertain (e.g. in small infants where exam can be difficult)	Manual reduction – to relieve acute symptoms Herniorrhaphy – definitive treatment by reduction of herniated contents and high ligation of sac for indirect hernias Laparoscopic or open techniques	Risk of recurrence after surgical reduction <3% but higher if repair done in premature infants or if hernia was incarcerated/strangulated at repair

## Skin Lesions

- see [Dermatology](#), D5; [Emergency](#), ER17; [Plastic Surgery](#) PL5

All inguinal hernias of infancy and childhood require repair at the earliest convenience. Emergent repair if incarcerated/strangulated!

## Common Medications

<b>Antiemetics</b>	<ul style="list-style-type: none"> <li>dimenhydrinate (Gravol®) 25-50 mg PO/IV/IM q4-6h prn</li> <li>prochlorperazine (Stemetil®) 5-10 mg PO/IV/IM bid-tid prn</li> <li>metoclopramide (Maxeran®) 10 mg IV/IM q2-3h prn, 10-15 mg PO qid (30 min before meals and qhs)</li> <li>ondansetron (Zofran®) 4-8 mg PO q8h prn</li> <li>granisetron (Kytrel®) 1 mg PO bid (for nausea from chemotherapy/radiation)</li> </ul>
<b>Analgesics</b>	<ul style="list-style-type: none"> <li>acetaminophen ± codeine (Tylenol® #3/plain) 1-2 tabs q4-6h PO/PR prn</li> <li>morphine 2.5-10 mg IM/SC q 4-6h prn + 1-2 mg IV q1h prn for breakthrough</li> <li>ketorolac (Toradol®) 30-60 mg IM/IV q6h prn</li> <li>Percocet® (acetaminophen/oxycodone, 325/5 mg) 1-2 tabs PO q4-6h prn</li> </ul>
<b>DVT Prophylaxis</b>	<ul style="list-style-type: none"> <li>heparin 5000 units SC bid, if cancer patient then heparin 5000 units SC tid</li> <li>dalteparin (Fragmin®) 5000 units SC daily</li> <li>enoxaparin (Lovenox®) 40 mg SC daily</li> </ul>
<b>Antidiarrheals</b>	<ul style="list-style-type: none"> <li>loperamide (Imodium®) 4 mg PO initially, then 2 mg PO after each loose stool up to 16 mg/d</li> <li>diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PO qid</li> </ul>
<b>Laxatives</b>	<ul style="list-style-type: none"> <li>sennosides (Senokot®) 1-2 tabs qhs</li> <li>docusate sodium (Colace®) 100 mg PO bid</li> <li>glycerine suppository 1 tab PR prn</li> <li>lactulose 15-30 mL PO qid prn</li> <li>milk of magnesia (MOM) 30-60 mL PO qid prn</li> <li>bisacodyl (Dulcolax®) 10-15 mg PO prn</li> </ul>
<b>Sedatives</b>	<ul style="list-style-type: none"> <li>zopiclone (Imovane®) 5-7.5 mg PO qhs prn</li> <li>lorazepam (Ativan®) 0.5-2 mg PO/SL qhs prn</li> </ul>
<b>Antibiotics</b>	<ul style="list-style-type: none"> <li>cefazolin (Ancef®) 1 g IV/IM on call to OR or q8h – GP except <i>Enterococcus</i>, GN only <i>E. coli</i>, <i>Klebsiella</i> and <i>Proteus</i></li> <li>cefalexin (Keflex®) 250-500 mg PO qid – <i>Listeria</i>, GP except <i>Enterococcus</i>, GN only <i>E. coli</i>, <i>Klebsiella</i> and <i>Proteus</i></li> <li>ceftriaxone 1-2 g IM/IV q24h – broad coverage including <i>Pseudomonas</i></li> <li>ampicillin 1-2 g IV q4-6h – <i>Listeria</i>, GP (<i>Enterococcus</i>) except <i>Streptococcus</i> and <i>E. coli</i>, oral anaerobes except <i>Bacteroides</i></li> <li>gentamicin 3-5 mg/kg/d IM/IV divided q8h; monitor creatinine, gentamicin levels – GN including <i>Pseudomonas</i></li> <li>ciprofloxacin 400 mg IV q12h, 500 mg PO bid – GN including <i>Pseudomonas</i></li> <li>metronidazole (Flagyl®) 500 mg PO/IV bid, (500 mg PO tid for <i>C. difficile</i>) – anaerobes</li> <li>clindamycin 600-900 mg IV q8h, 150-400 mg PO qid – GP except <i>Enterococcus</i>, anaerobes</li> </ul>
<b>Over-the-Counter Medications</b>	<ul style="list-style-type: none"> <li>Pepto-Bismol® (bismuth subsalicylate) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d side effects: black stools, risk of Reye's syndrome in children</li> <li>Alka-Seltzer® (ASA + citrate + bicarbonate) 2 tabs in 4 oz water PO q4h prn, max 8 tabs</li> <li>Maalox® (aluminum hydroxide + magnesium hydroxide) 10-20 mL or 1-4 tabs PO prn</li> <li>Tums® (calcium carbonate) 1-3 g PO q2h prn</li> <li>Rolaids® (calcium carbonate and magnesium hydroxide) 2-4 tabs PO q1h prn, max 12 tabs/d</li> </ul>

### Geriatric Giants

- Memory
- Falls
- Incontinence
- Polypharmacy

### 5 Is of Geriatrics

- Immobility
- Intellect
- Incontinence
- Iatrogenesis
- Impaired homeostasis

## Physiology and Pathology of Aging

### Definition

- major categories of impairment that appear with old age and affect the physical, mental and social domains of the elderly, usually due to many predisposing and precipitating factors, rather than a single cause

**Table 2. Changes Occurring Frequently with Aging**

System	Physiological Changes	Pathological Changes
<b>Neurologic</b>	Decreased wakefulness, brain mass, cerebral blood flow	Increased insomnia, neurodegenerative disease, stroke, decreased reflex response
<b>Special Senses</b>	Decreased lacrimal gland secretion, lens transparency, dark adaptation, decreased sense of smell and taste	Increased glaucoma, cataracts, macular degeneration, presbycusis, presbyopia, tinnitus, vertigo, oral dryness
<b>Cardiovascular</b>	Increased sBP, dBP, decreased HR, CO Decreased vessel elasticity, cardiac myocyte size and number, $\beta$ -adrenergic responsiveness	Increased atherosclerosis, CAD, MI, CHF, hypertension, arrhythmias
<b>Respiratory</b>	Increased tracheal cartilage calcification, mucous gland hypertrophy Decreased elastic recoil, mucociliary clearance, pulmonary function reserve	Increased COPD, pneumonia, pulmonary embolism
<b>Gastrointestinal</b>	Increased intestinal villous atrophy Decreased esophageal peristalsis, gastric acid secretion, liver mass, hepatic blood flow, calcium and iron absorption	Increased cancer, diverticulitis, constipation, fecal incontinence, hemorrhoids, intestinal obstruction
<b>Renal and Urologic</b>	Increased proteinuria, urinary frequency Decreased renal mass, creatinine clearance, urine acidification, hydroxylation of vitamin D, bladder capacity	Increased urinary incontinence, nocturia, BPH, prostate cancer, pyelonephritis, nephrolithiasis, UTI
<b>Reproductive</b>	Decreased androgen, estrogen, sperm count, vaginal secretion Decreased ovary, uterus, vagina, breast size	Increased breast and endometrial cancer, cystocele, rectocele, atrophic vaginitis
<b>Endocrine</b>	Increased NE, PTH, insulin, vasopressin Decreased thyroid and adrenal corticosteroid secretion	Increased DM, hypothyroidism, stress response
<b>Musculoskeletal</b>	Increased calcium loss from bone Decreased muscle mass, cartilage	Increased arthritis, bursitis, osteoporosis, muscle weakness with gait abnormalities, polymyalgia rheumatica
<b>Integumentary</b>	Atrophy of sebaceous and sweat glands Decreased epidermal and dermal thickness, dermal vascularity, melanocytes, collagen synthesis	Increased lentigo, cherry hemangiomas, pruritus, seborrheic keratosis, herpes zoster, decubitus ulcers, skin cancer
<b>Psychiatry</b>	None	Increased depression, dementia, delirium, suicidality, substance abuse, anxiety, insomnia

### Most Common Acute Disorders in the Elderly

- Cardiovascular disease (CHF, CVA, MI)
- Fracture (hip, vertebrae, wrist)
- Medication-related
- Pneumonia
- Sepsis

### Most Common Chronic Disorders in the Elderly

- Arthritis
- Cataracts and other visual problems
- COPD
- Cardiovascular disease
- Diabetes Mellitus (Type 2)
- Hearing impairment
- Hypertension
- Mental disorders
- Orthopedic disorders
- Sinusitis

# Differential Diagnoses of Common Presentations

## Constipation

- see [Gastroenterology](#), G24

### Definition

- less than 3 bowel movements in one week and/or hard stools, straining, sense of blockade, needing manual maneuvers or incomplete evacuation on more than 25% of occasions for at least 12 wk (does not need to be consecutive)

### Epidemiology

- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation)

### Pathophysiology

- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

### Treatment

- non-pharmacological
  - increase fibre intake
  - ensure adequate fluid intake
  - discourage chronic laxative use
  - engage in regular exercise
  - review medication regime, reduce dosages or substitute
- pharmacologic
  - see *Common Medications*, GM15

### Risk Factors for Constipation in the Elderly Include:

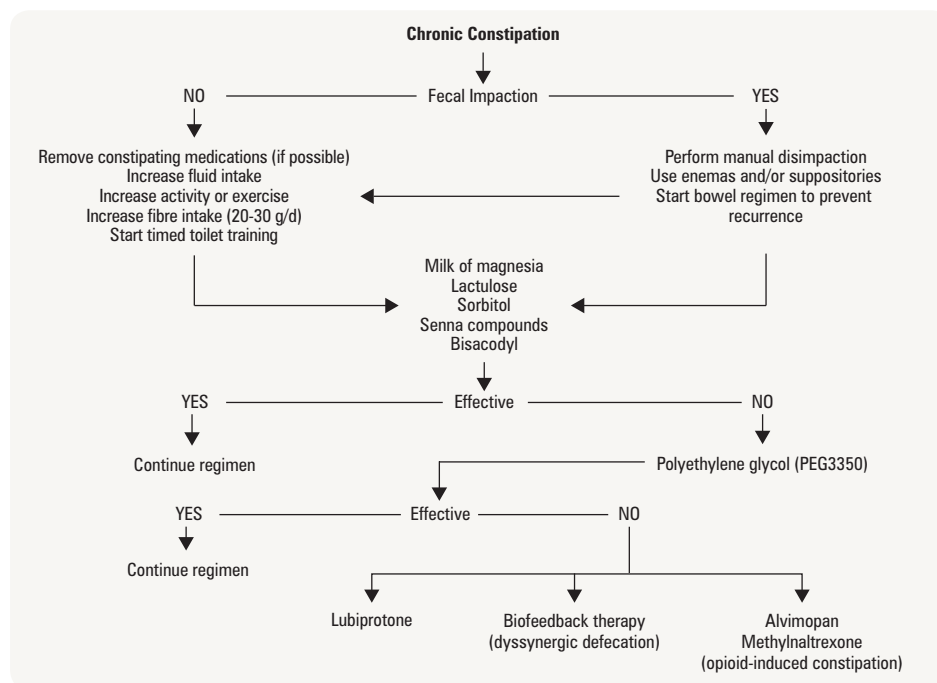

- Immobility
- Diet: low fibre/calorie diet, dehydration
- Medications:
  - Polypharmacy
  - Drugs: narcotics, calcium channel blockers, anticholinergics
- GI: obstructive lesions (bowel obstruction, cancer, diverticular disease, IBD, strictures, uterine prolapse), altered colonic motility (IBS, colonic inertia)
- Neurological: spinal cord injury, Parkinson's disease, stroke, autonomic dysfunction
- Metabolic: diabetes, hypokalemia, hypercalcemia
- Psychiatric: depression, dementia

Remember to first exclude low fibre and lack of activity as causes of constipation.

Docusate sodium has been shown to be ineffective for the prevention/ treatment of constipation in the elderly.

**Figure 1. Treatment algorithm for the management of chronic constipation in the elderly**

Adapted from: Clin Interv Aging 2010;5:163-171

## Delirium, Dementia and Depression

- see [Psychiatry](#), PS19, PS20, PS9 and [Neurology](#), N17

### Definition

- pathologic decrease in memory, language, or executive function

### Differential Diagnosis

- delirium, dementia, or pseudodementia of depression

Table 3. Differentiating the Three Ds of Cognitive Impairment

	Dementia	Delirium	Depression
<b>Onset</b>	Gradual or step-wise decline	Acute (hours-days)	Subacute
<b>Duration</b>	Months-years	Days-weeks	Variable
<b>Natural History</b>	Progressive, usually irreversible	Fluctuating, reversible High morbidity/mortality in very old	Recurrent Usually reversible
<b>Level of Consciousness</b>	Normal	Fluctuating	Normal
<b>Attention</b>	Intact initially	Decreased, wandering	Difficulty concentrating
<b>Orientation</b>	Intact initially	Impaired, fluctuates	Intact
<b>Behaviour</b>	Disinhibition, loss of ADL/IADLs, personality change	Severe agitation/retardation	Importuning, self-harm/suicide
<b>Psychomotor</b>	Normal	Fluctuates between extremes	Slowing
<b>Sleep-Wake Cycle</b>	Fragmented sleep at night	Reversed sleep-wake cycle	Early morning awakening
<b>Mood and Affect</b>	Labile but not usually anxious	Anxious, irritable, fluctuating	Depressed, stable
<b>Cognition</b>	Decreased executive function, paucity of thought	Fluctuation preceded by mood changes	Concentration impaired
<b>Memory Loss</b>	Recent, eventually remote	Marked recent	Recent
<b>Language</b>	Agnosia, aphasia, decreased comprehension, repetition	Dysnomia, dysgraphia, speech rambling, subject changes, incoherence	Not affected
<b>Delusions</b>	Compensatory	Nightmarish, poorly formed	Nihilistic, somatic
<b>Hallucinations</b>	Variable, Vacuous, bland	Visual common, frightening/bizarre	Self-deprecatory

### Delirium Prevention in Elderly

- ensure optimal vision and hearing to support orientation (e.g. clean, appropriate eyewear and hearing aids)
- provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- encourage regular mobilization to build and maintain strength, balance and endurance
- avoid unnecessary medications and monitor for drug interactions
- avoid bladder catheterization if possible
- ensure adequate sleep

#### Antipsychotics for Delirium

Cochrane DB Syst Rev 2009;CD005594

**Objectives:** To compare the efficacy and incidence of adverse effects of haloperidol with risperidone, olanzapine and quetiapine in the treatment of delirium.

**Selection Criteria:** Types of studies included unconfounded, randomized trials with concealed allocation of subjects.

**Results:** Three studies were included, comparing haloperidol with risperidone, olanzapine and placebo in the management of delirium and in the incidence of adverse drug reactions. Decreases in delirium scores were not significantly different when comparing the effect of low dose haloperidol (<3.0 mg/d) with olanzapine and risperidone (odds ratio 0.63; 95% CI 0.29 to 1.38; p=0.25). High dose haloperidol (>4.5 mg/d) was associated with an increased incidence of extrapyramidal adverse effects compared with olanzapine. Low dose haloperidol decreased the severity and duration of delirium in post-operative patients, although not the incidence of delirium compared to placebo.

**Author's Conclusions:** There is no evidence that haloperidol in low dosage has different efficacy in comparison with the atypical antipsychotics olanzapine and risperidone in the management of delirium or has a greater frequency of adverse drug effects than these drugs. High dose haloperidol was associated with a greater incidence of side effects. Low dose haloperidol may be effective in decreasing the degree and duration of delirium in post-operative patients, compared with placebo. However, all studies were small and should be repeated.

## Elder Abuse

### Definition

- includes physical abuse, sexual abuse, emotional/psychological abuse, financial abuse, abandonment and neglect
- elder abuse is a criminal offence under the Criminal Code of Canada
- in the U.S., most states have criminal penalties for elder abuse

### Epidemiology

- in Canada, approximately 4% of elderly persons living in private homes have suffered abuse
- in the U.S., estimates of the frequency of elder abuse range from 3-8%
- physician reporting is mandatory only in Newfoundland, Nova Scotia and Prince Edward Island; in Ontario, only abuse occurring in nursing homes is mandatory to report
- insufficient evidence to include/exclude screening in the Periodic Health Exam

### Risk Factors

Table 4. Risk Factors for Elder Abuse

<b>Situational Factors</b>	Isolation Unstable or unsafe living arrangements Lack of family, community or living facility resources for additional care
<b>Victim Characteristics</b>	Physical or emotional dependence on caregiver Lack of close family ties History of family violence Dementia or recent deterioration in health
<b>Perpetrator Characteristics</b>	Related to victim Living with victim Long duration of care for victim (mean 9.5 yr) Financial, marital, occupational or other stressors

## Caregiver Abuse Screen (CASE)

- instructions:
  - to be answered by caregivers, if answer “yes” to a question, further explore issue
  - the more “yes” responses, the more likely the presence of abuse
- screening tool
  - please answer the following questions as a helper/caregiver:
    1. Do you sometimes have trouble making \_\_\_\_\_ control his/her temper or aggression?
    2. Do you often feel you are being forced to act out of character/do things you feel badly about?
    3. Do you find it difficult to manage \_\_\_\_\_’s behavior?
    4. Do you sometimes feel that you are forced to be rough with \_\_\_\_\_?
    5. Do you sometimes feel that you can’t do what is really necessary or what should be done for \_\_\_\_\_?
    6. Do you often feel you have to reject/ignore \_\_\_\_\_?
    7. Do you often feel so tired and exhausted that you cannot meet \_\_\_\_\_’s needs?
    8. Do you often feel you have to yell at \_\_\_\_\_?

From: NICE. Case: Caregiver Abuse Screen. 2010. Reproduced with permission from NICE.

## Management

- assess safety and determine capacity to make decisions about living arrangements
- establish need for hospitalization or alternate accommodation (e.g. immediate risk of physical harm by self or caregiver)
- involve multidisciplinary team (e.g. nurse, social worker, family members and physicians including geriatrician, psychiatrist or family physician)
- educate and assist caregiver, contact local resources (e.g. legal aid, crisis support, PSW, caregiver support groups)
- interpret critical and lab findings that are key in exclusion, differentiation and diagnosis

## Falls

### Epidemiology

- 30-40% of people >65 yr old and ~50% of people >80 yr old fall each year
  - equally common between men and women, but more likely to result in injury in women
  - 5% of falls lead to hospitalization
  - 5-10% associated with serious injuries (e.g. hip fracture, head injury, laceration)
    - ♦ 1-2% of falls associated with hip fracture
    - ♦ 15% die in hospital, 33% 1-yr mortality
  - between 25-75% do not recover to previous level of ADL function
  - mortality increases with age (171/100,000 in men >85 yr old) and type of injury (25% with hip fracture die within 6 mo)

### Etiology

- multifactorial
- extrinsic
  - environmental (e.g. home layout, lighting, stairs, footwear), accidental, abuse
  - medications/substances (e.g. alcohol)
  - within one month of hospital discharge, acute illness, exacerbation of chronic illness
- intrinsic
  - orthostatic/syncopal
  - age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)
  - past history of a fall

### Investigations

- directed by history and physical
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose,  $\text{Ca}^{2+}$ , TSH,  $\text{B}_{12}$ , urinalysis, cardiac enzymes, ECG, CT head

### Prevention

- multidisciplinary, multifactorial, health and environment risk factor screening and intervention programs in the community
- muscle strengthening, balance retraining and group exercise programs (e.g. tai chi)
- home hazard assessment and modification (e.g. remove rugs, add shower bars, etc.)
- prescription of vitamin D 1000 IU daily
- tapering or gradual discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight and footwear optimization

### Red Flags for Elder Abuse

- Delay in seeking medical attention
- Disparity in histories
- Implausible or vague explanations
- Frequent emergency room visits for exacerbations of chronic disease despite plan for medical care and adequate resources
- Presentation of functionally impaired patient without designated caregiver
- Lab findings inconsistent with history

### Medication as a Risk Factor for Falls: Critical Systematic Review

*J Gerontol A Biol Sci Med Sci* 2007;62:1172-1181

**Purpose:** To review all original articles systematically examining medication use as a risk factor for falls or fall-related fractures in people 60 yr and older.

**Study Selection:** Studies investigating “falls” or “accidental falls” and “pharmaceutical preparations” or specific groups of drugs were included. Studies not meeting the age criterion, not controlled with nonusers of target medicines or nonfallers, or with no clear definition of target medication were excluded.

**Results:** 28 observational studies and one randomized controlled trial met the inclusion criteria. The outcome measure was fall in 22 studies and fracture in 7 studies. The main group of drugs associated with an increased risk of falling was psychotropics: benzodiazepines, antidepressants and antipsychotics. Antiepileptics and drugs that lower blood pressure were weakly associated with falls.

**Conclusions:** Central nervous system drugs, especially psychotropics, seem to be associated with an increased risk of falls. Further studies are required due to lack of clear definition of a fall, target medications or prospective follow-up.

### Key Physical Findings in the Elderly Patient Who Falls or Nearly Falls

#### I HATE FALLING

Inflammation of joints

Hypotension (orthostatic changes)

Auditory and visual abnormalities

Tremor

Equilibrium (balance) problem

Foot Problems

Arrhythmia, heart block or valvular disease

Leg-length discrepancy

Lack of conditioning (generalized weakness)

Illness

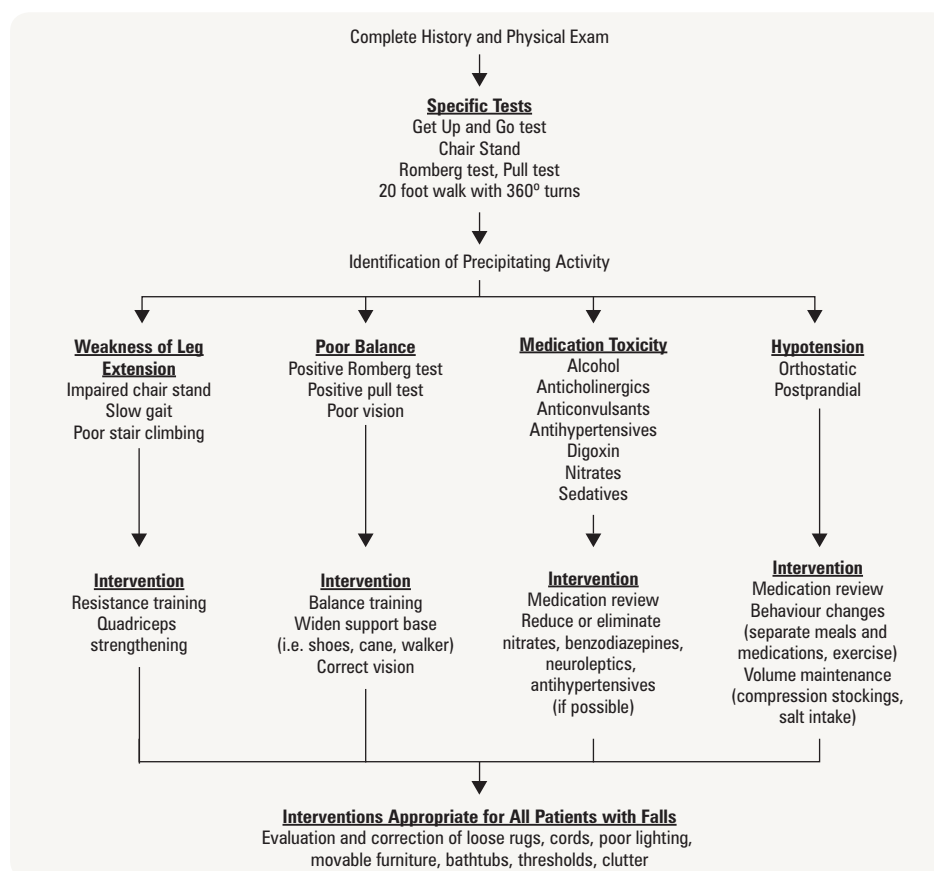

Nutrition

Gait disturbance

*Am Fam Phys* 2001;61:2159-2172

A history of falls within the past 1-2 yr is a predictor of motor vehicle crashes in the older population. These patients should be evaluated on their ability to drive and counseled about driving.

**Figure 2. Approach to falls in the elderly**

Adapted from: JAMA 2007;297:77-86 and NEJM 1994;331:821-827

#### Drugs That May Increase the Risk of Falling

- Sedative-hypnotic and anxiolytic drugs (especially long-acting benzodiazepines)
- Antidepressants (including MAOIs, SSRIs, TCAs)
- Antipsychotics and tranquilizers (phenothiazines and butyrophenones)
- Antihypertensive drugs
- Antiarrhythmics (Class IA)
- Diuretics
- Systemic corticosteroids
- NSAIDs
- Anticholinergic drugs
- Hypoglycemic agents
- Alcohol

Adapted from: Am Fam Phys 2001;61:2159-2172  
Geriatrics At Your Fingertips, 13th ed. New York: Am Geriat Soc, 2011

#### Fall Prevention Tips

- Improve lighting, especially on stairs
- Caution while adjusting to new bifocal prescription (poor depth perception)
- Siderails in bathtubs
- Railings on steps
- Connect patient to lifeline button signaling systems
- Remove loose mats or carpets, telephone cords and other tripping hazards
- Recommend support hose for varicose veins and swelling of ankles

Essential Geriatrics: Managing 6 Conditions. Patient Care Canada 1997;8

#### Will My Patient Fall?

JAMA 2007;297:77-86

**Purpose:** To identify the prognostic value of risk factors for future falls among older patients.

**Study Selection:** Prospective cohort studies of risk factors for falls that performed a multivariate analysis of such factors.

**Results:** 18 studies were included. Clinically identifiable risk factors were identified across 6 domains: orthostatic hypotension, visual impairment, impairment of gait or balance, medication use, limitations in basic or instrumental activities of daily living and cognitive impairment. The estimated pretest probability of falling at least once in any given yr for individuals 65 yr and older was 27% (95% CI, 19%-36%). Patients who have fallen in the past yr are more likely to fall again (LR2.3-2.8). The most consistent predictors of future falls are clinically detected abnormalities of gait or balance (LR 1.7-2.4). Visual impairment, medication variables, decreased activities of daily living and impaired cognition did not consistently predict falls across studies. Orthostatic hypotension did not predict falls after controlling for other factors.

**Conclusions:** Screening for risk of falling during the clinical examination begins with determining if the patient has fallen in the past yr. For patients who have not previously fallen, screening consists of an assessment of gait and balance. Patients who have fallen or who have a gait or balance problem are at higher risk of future falls.

## Frailty (Failure to Thrive)

### Definition

- declining independence and functional capacity with loss of energy, vigor and/or weight in older adults
- not an inevitable consequence of aging

### Etiology

- malnutrition, functional impairment, cognitive impairment and depression

**Table 5. Common Medical Conditions Associated with Failure to Thrive**

Medical Condition	Cause of Failure to Thrive
Cancer	Metastases, malnutrition, cachexia
Chronic lung disease	Respiratory failure
Chronic renal insufficiency	Renal failure
Chronic steroid use	Steroid myopathy, diabetes, osteoporosis, vision loss
Cirrhosis, hepatitis	Hepatic failure
Depression, other psychiatric disorder	Major depression, psychosis, poor functional status, cognitive loss
Diabetes	Malabsorption, poor glucose homeostasis, end-organ damage
Gastrointestinal surgery	Malabsorption, malnutrition
Hip, long bone fracture	Functional impairment
Inflammatory bowel disease	Malabsorption, malnutrition
Myocardial infarction, congestive heart failure	Cardiac failure
Recurrent UTI, pneumonia	Chronic infection, functional impairment
Rheumatologic disease (GCA, RA, SLE)	Chronic inflammation
Stroke	Dysphagia, depression, cognitive loss, functional impairment
Tuberculosis, other systemic infection	Chronic infection

#### Four Syndromes in Failure to Thrive

##### My Pa Can't Drive

Malnutrition  
Physical impairment  
Cognitive impairment  
Depression

#### A Global Clinical Measure of Fitness and Frailty in Elderly People

CMAJ 2005;173:489-495

**Purpose:** To develop a tool to define clinical frailty.

**Methods:** A five yr prospective cohort study with 2305 participants in the Canadian Study of Health and Aging (CSHA-2). A 7-point Clinical Frailty Scale was developed and assessed for its ability to predict death and need for institutionalization. It was also compared to other established tools (i.e. Frailty Index).

**Results:** The CSHA Clinical Frailty Scale had 7 points ranging from 'Very Fit' (robust, active, energetic) to 'Severely Frail' (completely dependent, terminally ill). Each 1-category increment increased medium-term risk of death by 21% (95%CI 12.5%-30.6%) and entry into institutional care by 23.9% (95%CI 8.8%-41.2%). It correlated well with the Frailty Index ( $r=0.8$ ) and was better than measures of cognition, function or co-morbidity in assessing risk for death.

**Conclusions:** The CSHA Clinical Frailty Scale is predictive of death and need for an institution.

#### Functional Assessment (ADLs and IADLs)

##### ADLs: ABCDE-TT

Ambling  
Bathing  
Continence  
Dressing  
Eating  
Transferring  
Toileting

##### IADLs: SHAFT-TT

Shopping  
Housework  
Accounting/Managing finances  
Food preparation  
Transportation  
Telephone  
Taking medications

Can use formal assessment tools such as the Lawton-Brody Instrumental Activities of Daily Living Scale to assess functioning.

#### Transient Causes of Incontinence

##### DIAPERS

Delirium  
Infection  
Atrophic urethritis/vaginitis  
Pharmaceuticals  
Excessive urine output  
Restricted mobility  
Stool impaction

## Incontinence

### FECAL INCONTINENCE

#### Epidemiology

- second leading cause of nursing home placement

#### Etiology

- commonly multifactorial
  - structural abnormalities
  - trauma (e.g. prior vaginal delivery, surgery)
  - prolapse
  - tumour/trauma (e.g. brain, spinal cord, cauda equina)
  - overflow (e.g. encopresis, impaction)
- functional abnormalities
  - neurologic conditions – neuropathy, multiple sclerosis, stroke, dementia
- others
  - constipation with overflow may be a factor
  - psychosis (willful soiling)
  - age >80 yr: decreased external sphincter strength and weak anal squeeze, increased rectal compliance, decreased resting tone and internal sphincter, impaired anal sensation
  - medications (e.g. laxatives, anticholinergics, antidepressants, caffeine, muscle relaxants)

#### Investigations (if cause not apparent from history and physical)

- differentiate true incontinence from frequency and urgency (i.e. IBS, IBD)
- stool studies
- endorectal ultrasound
- colonoscopy, sigmoidoscopy, anoscopy
- anorectal manometry/functional testing

#### Management

- diet/bulking agent if stool is liquid or loose
- disimpaction, prevent impaction
- anti-diarrheal agents (e.g. loperamide)
- regular defecation program in patients with dementia
- counsel about biofeedback therapy (retraining of pelvic floor muscles)

## URINARY INCONTINENCE

- see [Urology](#), U6

### Epidemiology

- 15-30% prevalence dwelling in community and at least 50% of institutionalized seniors
- morbidity: cellulitis, pressure ulcers, urinary tract infections, falls with fractures, sleep deprivation, social withdrawal, depression, sexual dysfunction
- not associated with increased mortality

### Pathophysiology

- not a normal part of aging, urinary incontinence is a loss of control due to a combination of:
  - genitourinary pathology: increased post-void residual volume, increased involuntary bladder contractions (urge incontinence)
  - age-related changes: decreased bladder capacity
  - comorbid conditions and medications
  - functional impairment
- in elderly women: decline in bladder outlet and urethral resistance pressure promoting stress incontinence
- in elderly men: prostatic enlargement can cause overflow and urge incontinence

## Gait Disorders

- see [Neurology](#), N29

## Hazards of Hospitalization

**Table 6. Recommendations for Sequelae of Hospitalization in Older Patients**

Sequelae	Recommendations
Malnutrition	No dietary restrictions (except diabetes), assistance, dentures if necessary, sitting in a chair to eat
Urinary incontinence	Medication review, remove environmental barriers, discontinue use of catheter
Depression	Routine screening
Adverse drug event	Medication review
Confusion/delirium	Orientation, visual and hearing aids, volume repletion, noise reduction, early mobilization, medication review, remove restraints
Pressure ulcers	Low-resistance mattress, daily inspection, repositioning every 2 h
Infection	Early mobilization, remove unnecessary IV lines, catheters, NG tubes
Falls	Appropriate footwear, assistive devices, early mobilization, remove restraints, medication review
Hypotension/dehydration	Early recognition and repletion
Diminished aerobic capacity/loss of muscle strength/contractures	Early mobilization
Decreased respiratory function	Incentive spirometry, physiotherapy

### Cognitive Decline after Hospitalization in a Community Population of Older Persons

*Neurology* 2012;78:950-956

**Study:** 12-yr Cohort study of 1870 elderly residents interviewed at 3-yr intervals with cognitive testing and information on hospitalization (from hospital records).

**Results:** 71.4% of residents were hospitalized at least once. Post-hospital cognitive decline measured by episodic memory (3.3-fold increase) and executive function (1.7-fold increase) was evident and not related to cognitive function at baseline but moderately correlated with rate of cognitive decline before hospitalization ( $r=0.55$ ).

**Conclusions:** Cognitive function declines post-hospitalization even after controlling for illness severity and pre-hospital cognitive decline.

### Treatment of Hypertension in Patients 80 Years of Age or Older

*NEJM* 2008;358:1887-1898

**Study:** Randomized, double-blind, placebo-controlled, multicentre trial.

**Subjects:** 3845 patients who were 80 yr of age or older and had a sustained systolic blood pressure of 160 mmHg were followed for a median 1.8 yr.

**Intervention:** Indapamide (sustained release, 1.5 mg) or matching placebo. The angiotensin-converting enzyme inhibitor perindopril (2 or 4 mg), or matching placebo, was added if necessary to achieve the target blood pressure of 150/80 mmHg.

**Primary Outcome:** Fatal or nonfatal stroke.

**Results:** Mean BP was 173.0/90.8 mmHg. At 2 yr, the mean BP while sitting was 15.0/6.1 mmHg lower in the treatment group than in the placebo group. Treatment was associated with a 30% reduction in the rate of fatal or nonfatal stroke (95% CI, -1 to 51;  $p=0.06$ ), 39% reduction in the rate of death from stroke (95% CI, 1 to 62;  $p=0.05$ ), 21% reduction in the rate of death from any cause (95% CI, 4 to 35;  $p=0.02$ ), 23% reduction in the rate of death from cardiovascular causes (95% CI, -1 to 40;  $p=0.06$ ), and 64% reduction in the rate of heart failure (95% CI, 42 to 78;  $p<0.001$ ). Fewer serious adverse events were reported in the treatment group (358 vs. 448 in the placebo group;  $p=0.001$ ).

**Conclusions:** Antihypertensive treatment with indapamide (sustained release), with or without perindopril, in persons 80 yr of age or older reduces death from stroke, death from any cause and the incidence of heart failure.

## Hypertension

- see [Family Medicine](#), FM37
- 60-80% of elderly (>65 yr old) have hypertension
  - 60% of these have isolated systolic HTN
  - the benefit of treating hypertension in the elderly is 2-4 times greater than that achieved in the treatment of younger patients with primary hypertension
  - systolic and pulse pressure are major predictors of outcome in the elderly patient
  - in older adults, base treatment on sBP
- target BP: sBP <140, 65<dBP<90; for patients with DM: sBP <130, dBP <80
  - not recommended to lower BP below 120/80
- treatment:
  - non-pharmacologic treatments are first-line, then thiazide monotherapy is recommended
  - add ACEI/ARB if also atherosclerosis, DM, CHF or chronic kidney disease
  - add  $\beta$ -blockers if also angina or CHF

## Immobility

### Complications

- cardiovascular: orthostatic hypotension, venous thrombosis, embolism
- respiratory: decreased ventilation, atelectasis, pneumonia
- gastrointestinal: anorexia, constipation, incontinence, dehydration, malnutrition
- genitourinary: infection, urinary retention, bladder calculi, incontinence
- musculoskeletal: atrophy, contractures, bone loss
- skin: pressure ulcers
- psychological: sensory deprivation, delirium, depression

## Immunizations

- the following immunizations are recommended for people 65 yr of age and older
  - tetanus: every 10 yr
  - pneumococcus: every 5 yr
  - influenza: every autumn
  - herpes zoster: Zostivax®

## Malnutrition

### Definition

- involuntary weight loss of  $\geq 5\%$  baseline body weight or  $\geq 5$  kg
- hypoalbuminemia, hypocholesterolemia

### Etiology

- nutritional
  - decreased assimilation: impaired transit, maldigestion, malabsorption
  - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)
- stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
- mechanical: dental problems, dysphagia
- age-related changes: appetite dysregulation, decreased thirst
- mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

### Clinical Features

- history
  - recent or chronic illness
    - ♦ depression, GI symptoms
  - functional disability: impaired ADLs and IADLs
  - social factors: economic barriers, dental problems and living situation (e.g. living alone)
  - constitutional symptoms e.g. recent weight loss
- physical examination
  - BMI  $< 23.5$  in males,  $< 22$  in females should raise concern
  - temporal wasting, muscle wasting, presence of triceps skin fold
  - assess cognition

### Investigations

- CBC, electrolytes,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{PO}_4^{3-}$ , creatinine, LFTs (albumin, INR, bilirubin),  $\text{B}_{12}$ , folate, TSH, transferrin, lipid profile, urinalysis, ESR, CXR

## Osteoporosis

- see [Endocrinology](#), E42

## Presbycusis

- see [Otolaryngology](#), OT19

#### Remember to calculate BMI

BMI outside 22-27 kg/m<sup>2</sup> is a health risk.

#### Calculating Basic Caloric and Fluid Requirements

WHO daily energy estimates for adults  $> 60$  yr:

Female:  $10.5 \times (\text{weight in kg}) + 596$

Male:  $13.5 \times (\text{weight in kg}) + 487$

Maintenance fluid requirements for the elderly without cardiac or renal disease: 1500-2500 cc/24 h.

#### Etiology of Malnutrition in the Elderly

##### MEALS ON WHEELS

##### Medications

Emotional problems

Anorexia

Late-life paranoia

Swallowing disorders

Oral problems

Nosocomial infections

Wandering/dementia related activity

Hyperthyroid/Hypercalcemia/

Hypoadrenalism

Enteric disorders

Eating problems

Low-salt/Low-fat diet

Stones

## Pressure Ulcers

- see [Plastic Surgery](#), PL16

### Risk Factors

- extrinsic factors: friction, pressure, shear force
- intrinsic factors: immobility, malnutrition, moisture, sensory loss

**Table 7. Classification of Pressure Ulcers**

<b>Stage I</b>	Changes include skin temperature, tissue consistency or sensation An area of persistent erythema in lightly pigmented, intact skin; in darker skin, it may appear red, blue or purple
<b>Stage II</b>	Partial thickness skin loss involving the epidermis, dermis or both The ulcer is superficial and presents as an abrasion, blister or shallow crater
<b>Stage III</b>	Full thickness skin loss involving damage or necrosis of subcutaneous tissue which may extend down to, but not through, underlying fascia Presents as a deep crater with or without undermining of adjacent tissue
<b>Stage IV</b>	Full thickness skin loss with extensive destruction, tissue necrosis or damage to muscle, bone or supporting structures May have associated undermining and/or sinus tracts

### Prevention

- pressure reduction
  - frequent repositioning
  - pressure-reducing devices (static, dynamic)
- maintaining nutrition, encouraging mobility and managing incontinence

### Treatment

- optimize nutritional status
- minimize pressure on wound
- analgesia
- wound debridement (mechanical, enzymatic, autolytic) and dressing application
- maintain moist wound environment to enable re-epithelialization
- treatment of wound infections (topical gentamicin, silver sulfadiazine, mupirocin)
- swab wounds not demonstrating clinical improvement for C&S; biopsy chronic wounds to rule out malignancy
- stage IV ulcers typically warrant surgical debridement
- consider other treatment options
  - negative pressure wound therapy/vacuum-assisted closure (VAC)
  - biological agents: application of fibroblast growth factor, platelet-derived growth factor to wound
  - non-contact normothermic wound therapy
  - electrotherapy

#### Pressure-reducing Devices

Static devices distribute pressure over a greater surface area. Dynamic devices use alternating air currents to shift pressure to different body sites.

## Driving Competency

### Reporting Requirements

- physician-reporting to the Ministry of Transportation is mandatory in all provinces and territories except in Quebec, Nova Scotia and Alberta, where it is discretionary
- not an issue unique to geriatrics – any patient may suffer from a medical condition that impairs their ability to drive should be reported
- in the U.S., varies by state

### Conditions that may Impair Driving

**Table 8. Conditions that Impair Driving**

<b>Alcohol</b>	Patients with history of impaired driving and those with high probability of future impaired driving should not drive until further assessed Alcohol dependence or abuse: if suspected, should be advised not to drive Alcohol withdrawal seizure: must complete a rehabilitation program and remain abstinent and seizure-free for 6 mo before driving
<b>Blood Pressure Abnormalities</b>	Hypertension: sustained BP >170/110 should be evaluated carefully Hypotension: if syncopal, discontinue until attacks are treated and preventable

**Table 8. Conditions that Impair Driving** (continued)

<b>Cardiovascular Disease</b>	Suspected asymptomatic CAD or stable angina: no restrictions STEMI, NSTEMI with significant LV damage, coronary artery bypass surgery: no driving for one month following hospital discharge NSTEMI with minor LV damage, unstable angina: no driving for 48 h if percutaneous coronary intervention (PCI) performed or 7 d if no PCI performed
<b>Cerebrovascular Conditions</b>	TIA: should not be allowed to drive until a medical assessment is completed Stroke: should not drive for at least one month; may resume driving if functionally able; no clinically significant motor, cognitive, perceptual or vision deficits; no obvious risk of sudden recurrence; underlying cause appropriately treated; no post-stroke seizure
<b>COPD</b>	Mild/moderate impairment: no restrictions Moderate or severe impairment requiring supplemental oxygen: road test with supplemental oxygen
<b>Cognitive Impairment/Dementia</b>	Moderate to severe dementia is a contraindication to driving; defined as the "inability to independently perform 2 or more IADLs or any basic ADL" Patients with mild dementia should be assessed; if indicated, refer to specialized driving testing centre; if deemed fit to drive, re-evaluate patient every 6-12 mo Poor performance on MMSE, clock drawing or Trails B suggests a need to investigate driving ability further MMSE score alone (whether normal or low) is insufficient to determine fitness to drive
<b>Diabetes</b>	Diet controlled or oral hypoglycemic agents: no restrictions in absence of diabetes complications that may impair ability to drive (e.g. retinopathy, nephropathy, neuropathy, cardiovascular or cerebrovascular disease) Insulin use: may drive if no complications (as above) and no severe hypoglycemic episode in the last 6 mo
<b>Drugs</b>	Be aware of: analgesics, anticholinergics, anticonvulsants, antidepressants, antipsychotics, opiates, sedatives, stimulants Degree of impairment varies: patients should be warned of the medication/withdrawal effect on driving
<b>Hearing Loss</b>	Effect of impaired hearing on ability to drive safely is controversial Acute labyrinthitis, positional vertigo with horizontal head movement, recurrent vertigo: advise not to drive until condition resolves
<b>Musculoskeletal Disorders</b>	Physician's role is to report etiology, prognosis and extent of disability (pain, range of motion, coordination, muscle strength)
<b>Post-operative</b>	Outpatient, conscious sedation: no driving for 24 h Outpatient, general anesthesia: no driving for $\geq 24$ h
<b>Seizures</b>	First, single, unprovoked: no driving for 3 mo until complete neurologic assessment, EEG, CT head Epilepsy: can drive if seizure-free on medication and physician has insight into patient compliance
<b>Sleep Disorders</b>	If patient is believed to be at risk due to a symptomatic sleep disorder but refuses investigation with a sleep study or refuses appropriate treatment, the patient should not drive
<b>Visual Impairment</b>	Visual acuity: contraindicated to drive if $< 20/50$ with both eyes examined simultaneously Visual field: contraindicated to drive if $< 120^\circ$ along horizontal meridian and $15^\circ$ continuous above and below fixation with both eyes examined simultaneously

N.B. guidelines included refer specifically to private driving; please see CMA guidelines for commercial driving

#### Systematic Review of Driving Risk and the Efficacy of Compensatory Strategies in Persons with Dementia

*J Am Geriatr Soc* 2007;55:878-884

**Purpose:** To determine whether persons with dementia are at greater driving risk and, if so, to estimate the magnitude of this risk and determine whether there are efficacious methods to compensate for or accommodate it.

**Study Selection:** Systematic review of the case-control studies of drivers with a diagnosis of dementia.

**Results:** Drivers with dementia universally exhibited poorer performance on road tests and simulator evaluations. The one study that used an objective measure of motor vehicle crashes found that the crash risk in persons with dementia was 2 to 2.5 times greater than matched controls. No studies were found that examined the efficacy of methods to compensate for or accommodate the decreased driving performance.

**Conclusions:** Drivers with dementia are poorer drivers than cognitively normal drivers, but studies have not consistently demonstrated higher crash rates. Clinicians and policy makers must take these findings into account when addressing issues pertinent to drivers with a diagnosis of dementia.

#### Key Factors to Consider in Older Drivers

##### SAFEDRIVE

Safety record

Attention (e.g. concentration lapses, episodes of disorientation)

Family observations

Ethanol abuse

Drugs

Reaction time

Intellectual impairment

Vision/Visuospatial function

Executive functions (e.g. planning, decision-making, self-monitoring behaviours)

*Geriatrics* 1996;51:36-45

## Health Care Institutions

**Table 9. Classification of Health Care Services and Institutions**

Institution/Service	Description
<b>Community Support Services</b>	Health care services offered at home for those who can live independently at home or under the care of family members including professional health care services, personal care and support (ADL assistance), homemaking (IADL assistance), community support services (e.g. transportation, meal delivery, day programs, caregiver relief, security checks, etc.)
<b>Residential</b>	Divided into short ( $< 60$ -90 d/yr) and long (indefinite) stay
a) <b>Seniors Affordable Housing</b>	Seniors who live independently and manage their own care but prefer to live near other seniors; usually has accessibility features and rent is adjusted based on income
b) <b>Retirement/Nursing Home</b>	Residents are fairly independent and require minimal support with ADLs and IADLs; often privately owned
c) <b>Supportive Housing</b>	Residents require minimal to moderate assistance with daily activities while living independently; often rental units in an apartment and may offer some physiotherapy and rehabilitation services
d) <b>Long-term Care/Skilled Nursing Facility</b>	Around the clock nursing care and on-call physician coverage; often offers occupational therapy, physiotherapy, respiratory therapy and rehabilitation services; may be used short-term for caregiver respite or for supportive patient care to regain strength and confidence after leaving the hospital
e) <b>Hospice</b>	Free-standing facility or designated floor in a hospital or nursing home for care of terminally ill patients and their families; focus is on quality of life and often requires prognosis $\leq 3$ mo

- names of community health care institutions, types of facilities and services offered vary between geographical locations
- factors to consider when seeking services/institutions include level of care required, support networks, duration of stay and cost

## Palliative and End-of-Life Care

### Principles and Quality of Life

- support, educate and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

### End-of-Life Care Discussions

#### When to Initiate End-of-Life Care Discussions

- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient inquires about end-of-life care

#### Suggested Topics for Discussion

- goals of care (disease vs. symptom management)
- advance directives, power of attorney, public guardian and trustee
- treatment options and likelihood of success
- common medical interventions
  - mechanical ventilation
  - antibiotic therapy
  - feeding tubes
- resuscitation options and likelihood of success (Full Code vs. DNR status including preferences for CPR, intubation, ICU admission, artificial hydration)

### Power of Attorney

- see [Ethical, Legal and Organizational Aspects of Medicine](#), ELOAM8

### Instructional Advance Directives

- see [Ethical, Legal and Organizational Aspects of Medicine](#), ELOAM8

### Symptom Management

#### Assessment Tools

- **Edmonton Symptom Assessment System (ESAS):** a tool that asks patients to rate the intensity of symptoms from 0 to 10 and allows for tracking of the efficacy of interventions. Assesses: pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well being, shortness of breath, and "other problem"
- **Palliative Performance Scale (PPS):** a tool that uses functional status to predict survival in terminally ill patients. Assesses 5 components: ambulation, activity and evidence of disease, self-care, intake and conscious level

Source: Journal of Palliative Care, 1991;7:6-9 and Palliative Performance Scale, Victoria Hospice Society, 2006;120-121

Table 10. Management of Common End-of-Life Symptoms

Symptom	Non-Pharmacologic Management	Pharmacologic Management
<b>Constipation</b>	Rule out obstruction, impaction, anorectal disease; hydration and high fibre intake; increase mobility	Stop unnecessary opioids and medications with anticholinergic side effects; provide stool softener (e.g. docusate sodium), increase peristalsis (e.g. senna), alter water and electrolyte secretion (e.g. magnesium hydroxide)
<b>Death Rattle/ Increased Pulmonary Secretions</b>	Oral suctioning Discontinue unnecessary IV solutions	Scopolamine SC or transdermal
<b>Dry mouth</b>	Oral hygiene q2h, ice cubes, sugarless gum	Artificial saliva substitutes, bethanechol, pilocarpine 1% solution as mouth rinse
<b>Dysphagia</b>	Frequent small feeds, ideally seated, keep head of bed elevated for 30 min after eating, suction as necessary	Treat painful mucositis (diphenhydramine: lidocaine: Maalox® in a 1:2:8 mixture), candidiasis (fluconazole) as necessary
<b>Dyspnea</b>	Elevate head of bed, eliminate allergens, open window/use fan	Oxygen, bronchodilators, opioids (e.g. morphine, hydromorphone)
<b>Hiccups</b>	Dry sugar, breathing in paper bag	Chlorpromazine, haloperidol, metoclopramide, baclofen, marijuana
<b>Nausea and Vomiting</b>	Frequent and small meals, avoid offensive strong odours, treat constipation if present	Raised ICP: dexamethasone Anticipatory nausea, anxiety: lorazepam Vestibular disease, vertigo: dimenhydrinate Drug induced, hepatic or renal failure: prochlorperazine, haloperidol GERD: PPI or H2 antagonist Gastric stasis: metoclopramide Bowel obstruction: metoclopramide, dexamethasone, octreotide
<b>Pain</b>	Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance	Nociceptive pain: non-opioids (NSAIDs, acetaminophen), weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl) Neuropathic pain: anticonvulsants (gabapentin, pregabalin), antidepressants (TCAs, SSRIs), steroids (dexamethasone) Bony pain: non-opioids, weak opioids, bisphosphonates, radiation therapy
<b>Pruritus</b>	Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice	Antihistamines, phenothiazines, topical corticosteroids, calamine lotion
<b>Weakness</b>	Modify environment and activities to decrease energy expenditure	Treat insomnia, anemia, depression; consider psychostimulants

Source: J Am Geriatr Soc 2002;50:S205-S224 and On Continuing Practice 1993;20:20-25

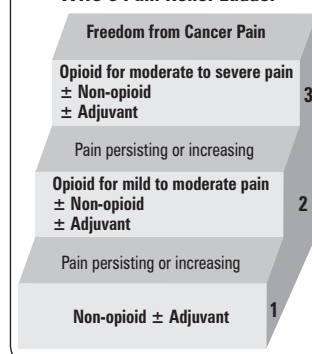

## Geriatric Pharmacology

### Pharmacokinetics

Table 11. Age-Associated Pharmacokinetics

Parameter	Age Effect	Implications
<b>Absorption</b> (less significant)	Increased gastric pH Decreased splanchnic blood flow, GI absorptive surface and dermal vascularity; delayed gastric emptying	Drug-drug and drug-food interactions are more likely to affect absorption
<b>Distribution</b>	Increased total body fat and $\alpha$ 1-glycoprotein Decreased lean body mass, total body water and albumin	Lipophilic drugs have a larger volume of distribution Decreased binding of acidic drugs, increased binding of basic drugs
<b>Metabolism</b> (less significant)	Decreased hepatic mass and hepatic blood flow; impaired phase I reactions (oxidative system)	Lower doses may be therapeutic
<b>Elimination</b>	Decreased renal blood flow, GFR, tubular secretion and renal mass	For every x% reduction in clearance, decrease the dose by x% and increase the interval by x%

#### WHO's Pain Relief Ladder

#### Death Rattle

Noise caused by the oscillatory movement of mucous secretions in the upper airway with inspiration and expiration.

#### Nociceptive Pain

Somatic: localized to bone/skin/joint/muscle; gnawing, dull pain  
Visceral: not well localized; crampy pain, pressure

#### Neuropathic Pain

Burning, shooting, radiating pain; localized to dermatomal regions

#### Opioid Equivalent Doses (to 10 mg of IV morphine)

Opioid	SC/IV dose	PO dose
Morphine	10 mg	20-30 mg
Codeine	Not recommended	180-240 mg
Oxycodone	Not recommended	10-15 mg
Hydromorphone	2 mg	4-6 mg

Fentanyl transdermal 25 µg/h = morphine 90 mg PO/24 h, however fentanyl takes 12-16 h to reach steady state

Serum creatinine does not reflect creatinine clearance in the elderly.

Instead, use:  
 $CrCl = \frac{(\text{weight in kg})(140 - \text{age})(1.23)}{72}$  (mL/min) (serum creatinine in µmol/L)

Multiply by 0.85 for females.

## Pharmacodynamics

### Drug Sensitivity

- changes in pharmacokinetics as well as intrinsic sensitivity lead to altered drug responses
- increased sensitivity to warfarin, sedatives, antipsychotics, digoxin and narcotics
- decreased sensitivity to  $\beta$ -blockers in majority of elderly patients, though some may have increased sensitivity

### Decreased Homeostasis

- poorer compensatory mechanisms leading to more adverse reactions (e.g. bleeding with NSAIDs/anticoagulants, altered mental status with anticholinergic/sympathomimetic/anti-Parkinsonian drugs)

## Polypharmacy

### Definition

- prescription, administration or use of many medications at the same time

### Epidemiology

- in Canada, over 25% of elderly women and about 20% of elderly men reported using  $\geq 3$  medications
- hospitalized elderly are given an average of 10 medications during admission

### Risk Factors for Non-Compliance

- risk of non-compliance correlates with medication factors, not age
  - number of medications – compliance with 1 medication is 80%, but drops to 25% with  $\geq 6$  medications
- increased dosing frequency, complicated container design, financial constraints, and cognitive impairment

### Adverse Drug Reactions (ADRs)

- any noxious or unintended response to a drug that occurs at doses used for prophylaxis or therapy
- risk factors in the elderly
  - intrinsic: co-morbidities, age-related changes in pharmacokinetics and pharmacodynamics
  - extrinsic: number of medications, multiple prescribers, unreliable drug history
- 90% of ADRs are from: ASA, analgesics, anticoagulants, antimicrobials, antineoplastics, digoxin, diuretics, hypoglycemics, steroids

### Preventing Polypharmacy

- consider drug: safer side effect profiles, convenient dosing schedules, convenient route, efficacy
- consider patient: other medications, clinical indications, medical co-morbidities
- consider patient-drug interaction risk factors for ADRs
- review drug list regularly to eliminate medications with no clinical indication or with evidence of toxicity
- avoid treating an ADR with another medication

## Inappropriate Prescribing in the Elderly

### Epidemiology

- the estimated prevalence of potentially inappropriate prescribing ranges from 12-40%

### Beers Criteria

- a list of medications to avoid in adults 65 and older due to safety concerns
- examples include long-acting benzodiazepines, strong anticholinergics, high-dose sedatives
- the elderly are also often under-treated (ACEI, ASA,  $\beta$ -blockers, thrombolytics, warfarin)

### Benzodiazepines of Choice in the Elderly

#### LOT

Lorazepam  
Oxazepam  
Temazepam

### Approach to Medication Review in the Elderly

#### NO TEARS

Need and indication  
Open-ended questions (to get patient's perspective on medications)  
Tests and monitoring (to assess disease control)  
Evidence and guidelines  
Adverse events  
Risk reduction (of adverse events such as falls)  
Simplification/switches

New medications: Start Low, Go Slow!

### Principles for Prescribing in the Elderly

#### CARED

Caution/Compliance  
Age (adjust dosage for age)  
Review regimen regularly  
Educate  
Discontinue unnecessary medications

*Geriatric Pearls.* Philadelphia: FA Davis Company, 1999.

Adverse drug reactions in the elderly may present as delirium, falls, fractures, urinary incontinence/retention or fecal incontinence/impaction.

### Beers Criteria

For full list of medications, consult the following reference:  
The American Geriatrics Society 2012 Beers Criteria Update Expert Panel  
*J Am Geriatr Soc* 2012;60(4):616-31  
<http://www.americangeriatrics.org>

## Common Medications

Table 12. Common Medications

Drug Name	Brand Name	Dosing Schedule	Indications	Contraindications	Side Effects	Mechanism of Action
<b>ANALGESICS (non-opioid)</b>						
<b>acetaminophen</b>	Tylenol®	325-650 mg PO q4-6h prn (up to 4 g/d)	Fever, mild pain	Lower doses for hepatic and renal disease, chronic alcoholism, known hypersensitivity	Hepatotoxicity (in overdose)	Prostaglandin-synthesis inhibition, no anti-inflammatory effects
<b>ibuprofen</b>	Advil® Motrin®	200-800 mg PO q4-6h prn (up to 1200 mg/d)	Mild to moderate pain, inflammatory disorders, fever	Active GI bleed/ulcer disease, known hypersensitivity, severe renal or hepatic disease Geriatrics: more susceptible to adverse effects	Dyspepsia, nausea, diarrhea, dizziness, rash, GI toxicity (ulcer, perforation, bleed)	Prostaglandin-synthesis inhibition, anti-inflammatory effects
<b>celecoxib</b>	Celebrex®	200 mg PO daily or 100 mg PO bid	Osteoarthritis, rheumatoid arthritis, FAP	Cardiovascular or cerebrovascular disease, CABG (peri-op), sulfonamide or ASA/NSAID allergy, active GI bleed/ulcer, IBD, severe renal or hepatic disease, hyperkalemia	GI symptoms (pain, diarrhea, dyspepsia, flatulence), GI bleed, serious cardiovascular events	COX-2 inhibitor, analgesic, anti-inflammatory and anti-pyretic effects
<b>ANALGESICS (opioid) – see <a href="#">Anesthesia and Peri-Operative Medicine</a>, A26</b>						
<b>ANTI-HYPERTENSIVES</b>						
<b>thiazide diuretic</b> e.g. hydrochlorothiazide	Hydrazide®	12.5-25 mg PO daily	Hypertension, edema	Anuria, hepatic coma, pre-coma, known sensitivity to thiazides	Hypotension, transient hyperlipidemia, hypokalemia and other electrolyte disturbances, hyperuricemia, GI symptoms	Inhibition of Na <sup>+</sup> /Cl <sup>-</sup> co-transporter
<b>ACEI</b> e.g. ramipril	Altace®	2.5-20 mg PO daily	Essential hypertension, post-MI, cardiovascular disease, renal protection	Known hypersensitivity, angioedema	Hypotension, cough, headache, dizziness, asthenia, chest pain, nausea, peripheral edema, arthritis, dyspnea, angioedema, hyperkalemia	Inhibition of angiotensin-converting enzyme
<b>ARB</b> e.g. losartan	Cozaar®	50-100 mg PO daily	Essential hypertension (± diabetes mellitus)	Known hypersensitivity	Dizziness, hypotension, fatigue, headache, hyperkalemia	Antagonizes angiotensin II via blockade of the angiotensin type 1 receptor
<b>DHP CCB</b> e.g. amlodipine	Norvasc®	2.5-10 mg PO daily (initially)	Essential hypertension, chronic stable angina	Known hypersensitivity, severe hypotension, caution in aortic stenosis	Edema, muscle cramps, dizziness, headache, constipation, heartburn	Calcium ion influx inhibition
<b>COGNITIVE ENHANCERS</b>						
<b>donepezil</b>	Aricept®	5-10 mg PO daily	Moderate to severe dementia of Alzheimer's type	Known hypersensitivity, caution in pulmonary disease, sick sinus syndrome, seizure disorder	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Reversible inhibition of acetylcholinesterase
<b>galantamine</b>	Reminyl®	8-12 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, caution in sick sinus syndrome, seizure disorder, pulmonary disease, low body weight	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Reversible inhibition of acetylcholinesterase
<b>rivastigmine</b>	Exelon®	1.5 mg PO daily (starting) up to 6 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, severe hepatic disease, caution in sick sinus syndrome, pulmonary disease, seizure disorder	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Acetylcholinesterase inhibition (reversible but very slow)
<b>memantine</b>	Ebixa®/ Namenda® (Can)/(U.S.)	5 mg PO daily (starting) up to 10 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, conditions that alkalize urine, caution in cardiovascular conditions	Agitation, fatigue, dizziness, headache, hypertension, constipation	NMDA-receptor antagonist

**Table 12. Common Medications** (continued)

Drug Name	Brand Name	Dosing Schedule	Indications	Contraindications	Side Effects	Mechanism of Action
<b>LAXATIVES</b>						
<b>bran</b>	All-Bran®	1 cup/d	Constipation		Bloating, flatus	Bulk-forming laxative
<b>psyllium</b>	Metamucil® Prodiem Plain®	1 tsp PO tid	Constipation, hypercholesterolemia	N/V, abdominal pain, obstruction	Bloating, flatus	Bulk-forming laxative
<b>lactulose</b>	Chronulac® Cephulac® Kristalose®	15-30 cc PO daily/bid	Constipation, hepatic encephalopathy, bowel evacuation following barium exam	Patients on low galactose diets Abdominal pain, N/V	Flatus, cramps, nausea, diarrhea	Hyperosmolar agent, lowers pH of colon to decrease blood ammonia levels
<b>senna</b>	Senokot®/ Ex-lax® Glyssennid®	1-2 tabs PO daily or 10-15 cc syrup PO daily	Constipation	Abdominal pain, N/V	Cramps, griping, dependence	Stimulant laxative
<b>bisacodyl</b>	Dulcolax®	5-15 mg PO (10 mg PR)	Constipation	Ileus, obstruction, abdominal pain, N/V, severe dehydration	Cramps, pain, diarrhea	Stimulant laxative
<b>PARKINSONIAN AGENTS</b> – see <a href="#">Neurology, N48</a>						
<b>SLEEPING MEDICATIONS</b>						
<b>zopiclone</b>	Imovane®	3.75 mg PO qhs (initially)	Insomnia	Known hypersensitivity, caution in myasthenia gravis, severe hepatic disease Geriatrics: dose reduction (dose-related adverse events)	Bitter taste, palpitations, vomiting, anorexia, sialorrhea, confusion, agitation, anxiety, tremor, sweating	Short-acting hypnotic (no tolerance effects)
<b>temazepam</b>	Restoril®	15 mg PO qhs	Short-term management of insomnia	Known hypersensitivity, myasthenia gravis, sleep apnea Geriatrics: dose reduction recommended	Drowsiness, dizziness, impaired coordination, hangover, lethargy, dependence	Benzodiazepine: generalized CNS depression mediated by GABA
<b>lorazepam</b>	Ativan®	0.5 mg PO qhs (initially)	Anxiety, insomnia	Known hypersensitivity, myasthenia gravis, narrow- angle glaucoma Geriatrics: dose reduction recommended	Dizziness, drowsiness, lethargy, dependence	Benzodiazepine: generalized CNS depression mediated by GABA

Note: Docusate has been shown to be ineffective for the prevention/treatment of constipation in the elderly

## Landmark Geriatric Trials

Trial	Reference	Results
Donepezil and Memantine for Moderate-to-Severe Alzheimer's Disease	NEJM 2012; 366:893-903	Continued treatment with donepezil was associated with cognitive benefits over the course of 12 mo in patients with moderate or severe Alzheimer's disease
Early palliative care for metastatic lung cancer	NEJM 2010; 363:733-742	Among patients with metastatic non-small-cell lung cancer, early palliative care led to significant improvements in both quality of life and mood. As compared with patients receiving standard care, patients receiving early palliative care had less aggressive care at the end-of-life but longer survival
Hip protectors for fracture prevention	NEJM 2000; 343:1506-1513	The risk of hip fracture can be reduced in frail elderly adults by the use of an anatomically designed external hip protector
HYVET	NEJM 2008; 358:1887-1898	Antihypertensive treatment with indapamide (sustained release), with or without perindopril, in adults 80 yr or older is beneficial
PROFET	Lancet 1999; 353:93-97	Demonstrates that an interdisciplinary approach to elderly adults with a previous history of falls can significantly decrease the risk of further falls and limit functional impairment
Yale Delirium Prevention Trial	NEJM 1999; 340:669-676	A risk-factor intervention strategy can result in significant reductions in the number and duration of episodes of delirium in hospitalized older patients

## Basic Anatomy Review

**Figure 1. Vulva and perineum**

### A. EXTERNAL GENITALIA (Figure 1)

- referred to collectively as the vulva
- blood supply: internal pudendal artery
- sensory innervation: pudendal nerve
- lymphatic drainage: inguinal nodes

### B. VAGINA

- muscular canal extending from cervix to vulva, anterior to rectum and posterior to bladder
- lined by rugated, stratified-squamous epithelium
- upper vagina separated by cervix into anterior, posterior and lateral fornices
- blood supply: vaginal branch of internal pudendal artery with anastomoses from uterine, inferior vesical and middle rectal arteries

### C. UTERUS

- thick walled, muscular organ between bladder and rectum, consisting of two major parts:
  - uterine corpus
    - ♦ blood supply: uterine artery (branch of the internal iliac artery)
  - cervix
    - ♦ blood supply: cervical branch of uterine artery
- supported by the pelvic diaphragm, the pelvic organs and 4 paired sets of ligaments
  - round ligaments: travel from anterior surface of uterus, through broad ligaments and inguinal canals then terminate in the labia majora
    - ♦ function: anteversion
    - ♦ blood supply: Sampson's artery (branch of uterine artery running through round ligament)
  - uterosacral ligaments: arise from sacral fascia and insert into posterior inferior uterus
    - ♦ function: mechanical support for uterus and contain autonomic nerve fibres
  - cardinal ligaments: extend from lateral pelvic walls and insert into lateral cervix and vagina
    - ♦ function: mechanical support, prevent prolapse
  - broad ligaments: pass from lateral pelvic wall to sides of uterus; contain fallopian tube, round ligament, ovarian ligament, nerves, vessels and lymphatics
- infundibulopelvic ligament: continuous tissue that connects ovary to pelvic wall
  - contains the ovarian artery, ovarian vein, ovarian plexus, lymphatic vessels
- position of the uterus (Figure 3)
  - anteverted (majority)
  - retroverted

**Figure 2. External genital organs**

## Acronyms

$\beta$ -hCG	beta-human chorionic gonadotropin
AFP	alpha-fetoprotein
AIS	androgen insensitivity syndrome
AUB	abnormal uterine bleeding
BMI	body mass index
BSO	bilateral salpingo-oophorectomy
CAH	congenital adrenal hyperplasia
CMV	cytomegalovirus
D&C	dilatation and curettage
DES	diethylstilbestrol
DHEA	dihydroepiandrosterone
DM	diabetes mellitus
DUB	dysfunctional uterine bleeding
EPC	emergency postcoital contraception
FSH	follicle stimulating hormone
GA	gestational age
GIFT	gamete intrafallopian transfer
GnRH	gonadotropin-releasing hormone
GTD	gestational trophoblastic disease
GTN	gestational trophoblastic neoplasia
HMG	human menopausal gonadotropin
HPO	hypothalamic-pituitary-ovarian
HRT	hormone replacement therapy
HSG	hysterosalpingography
HSIL	high grade squamous intraepithelial lesion
HSV	herpes simplex virus
IBD	inflammatory bowel disease
ICSI	intracytoplasmic sperm injection
ITP	immune thrombocytopenic purpura
IUD	intrauterine device
IUI	intrauterine insemination
IVDU	intravenous drug use
IVF	in vitro fertilization
IVM	in vitro maturation
JRA	juvenile rheumatoid arthritis
LEEP	loop electrosurgical excision procedure
LH	luteinizing hormone
LHRH	luteinizing hormone releasing hormone
LMP	last menstrual period
LN	lymph node
LNMP	last normal menstrual period
MRKH	Mayer-Rokitansky-Küster-Hauser
NK	natural killer
OCP	oral contraceptive pill
PCOS	polycystic ovarian syndrome
PCR	polymerase chain reaction
PG	prostaglandin
PID	pelvic inflammatory disease
PMDD	premenstrual dysphoric disorder
PMN	polymorphonuclear neutrophils
PMS	premenstrual syndrome
RPR	rapid plasma reagin
SERMs	selective estrogen receptor modifiers
SHBG	sex hormone binding globulin
SHG	sonohysterography
STI	sexually transmitted infection
TAH	total abdominal hysterectomy
TB	tuberculosis
TET	tubal embryo transfer
TH	total hysterectomy
TSH	thyroid stimulating hormone
TZ	transformation zone
VDRL	venereal disease research laboratory
vWD	von Willebrand's disease
w/d	withdrawal
ZIFT	zygote intrafallopian transfer

Figure 3. Positioning of uterus

#### D. FALLOPIAN TUBES

- 8-14 cm muscular tubes extending laterally from the uterus to ovary
- interstitial, isthmic, ampullary and infundibular segments; terminates at fimbriae
- mesosalpinx: peritoneal fold that attaches fallopian tube to broad ligament
- blood supply: uterine and ovarian arteries

#### E. OVARIES

- consist of cortex with ova and medulla with blood supply
- supported by infundibulopelvic ligament (suspensory ligament of ovary)
- mesovarium: peritoneal fold that attaches ovary to broad ligament
- blood supply: ovarian arteries (branches off aorta), left ovarian vein (drains into left renal vein), right ovarian vein (drains into inferior vena cava)

Figure 4. Vascular supply

**Anteversion:** forward-tilted uterus.

**Anteflexion:** bending of uterus so the fundus is thrust forward.

**Retroversion:** backward-tilted uterus.

**Retroflexion:** bending of uterus so the fundus is thrust backward.

Determination of uterine position by clinical exam:

- If cervix faces anteriorly, i.e. toward vaginal orifice, more likely **RETROVERTED UTERUS**
- If cervix faces posteriorly, i.e. toward sacrum or rectum, more likely **ANTVERTED UTERUS**
- If uterus palpable on bimanual exam, more likely **ANTEVERTED UTERUS**

**"Water under the bridge"**

The ureters run posterior to the uterine arteries.

**Stages of Puberty**

**"Boobs, Pubes, Grow, Flow"**

Thelarche, Pubarche, Growth spurt, Menarche.

**Tanner Stage**

Thelarche

- None
- Breast bud
- Further enlargement of areola and breasts with no separation of contours
- 2° mound of areola and papilla
- Areola recessed to general contour of breast – adult

Pubarche

- None
- Downy hair along labia only
- Darker/coarse hair extends over pubis
- Adult type covers smaller area, no thigh involvement
- Adult hair in quantity and type. Extends over thighs

## Menstruation

### Stages of Puberty

- see [Pediatrics](#), P31
- adrenarche: increase in secretion of adrenal androgens; usually precedes gonadarche by 2 yr
- gonadarche: increased secretion of gonadal sex steroids; ~age 8
- thelarche: breast development
- pubarche: pubic and axillary hair development
- menarche: onset of menses, usually following peak height velocity and/or 2 yr following breast budding

# Menstrual Cycle

© Tess Peters 2009 and Sonya Anim 2003

	FOLLICULAR/PROLIFERATIVE PHASE (Variable Duration)			LUTEAL/SECRETORY PHASE (Fixed Duration - 14 days)		
	Early	Mid	Late	OVULATION	Early-Mid	Late
Initiating events	↓ E and ↓ P (from end of previous cycle)	↑ FSH acts on ovarian granulosa cells	Growing follicles continue to secrete E	Sudden switch from negative to positive feedback (E and P now ↑ FSH & LH)	Switch back to negative feedback	No fertilized oocyte
HPO axis	↑ GnRH pulse frequency ↑ FSH ↑ LH pulse frequency	↑ E from follicles (ovary)		↑↑ LH pulse amplitude (LH surge)	↓ LH	
Hormones			↑ E from follicles, esp. from dominant follicle	E peaks → LH surge → ovulation	↑ P from corpus luteum	↓ P secondary to degeneration of corpus luteum
Feedback on HPO axis		Negative feedback E → ↓ FSH, ↓ LH		Positive feedback: E and P → ↑ FSH, ↑ LH	Negative feedback P → ↓ FSH, ↓ LH	
Ovaries	↑ FSH → follicular growth in 3-30 follicles	↑ follicular growth (by reducing atresia) → ↑ E	Dominant follicle persists, remainder undergo atresia Granulosa cells luteinize → produce P	~36 h after LH surge, dominant follicle releases oocyte; corpus luteum (remnant of dominant follicle) produces P		Cessation of P from corpus luteum
Endometrium	Menses from P withdrawal (from end of previous cycle)		E builds up endometrium		P stabilizes endometrium	Withdrawal of P → menses
Cervical Mucus		Cervical mucus: Clear, ↑ amount, Spinnbarkeit 8-10 cm, more stringy				Opaque, scant amount, Spinnbarkeit 1-2 cm

E = estrogen; P = progesterone; FSH = follicle-stimulating hormone; LH = luteinizing hormone; GnRH = gonadotropin-releasing hormone; HPO = hypothalamic-pituitary-ovarian

Figure 5. Events of the normal menstrual cycle

## Characteristics

- Menarche 10-15 yr
- Average 12.2 yr
- Entire cycle  $28 \pm 7$  d with bleeding for 1-6 d
- 25-80 mL blood loss per cycle

## Estrogen

ESTROGEN is the main hormone in the follicular/proliferative phase and is stimulated by FSH. Increased estrogen mainly decreases FSH. The majority of estrogen is secreted by the dominant follicle.

Estrogen effects:

- On the follicles in the ovaries:
  - Reduces atresia
- On the endometrium:
  - Proliferation of glandular and stromal tissue
- On all target tissues:
  - Decreases E receptors

## Progesterone

PROGESTERONE is the main hormone in the luteal/secretory phase and is stimulated by LH. Increased progesterone mainly decreases LH and is secreted by the corpus luteum (remnant of dominant follicle).

Progesterone effects:

- On the endometrium:
  - Cessation of mitoses (stops building endometrium up)
  - "Organization" of glands (initiates secretions from glands)
  - Inhibits macrophages, interleukin-8 and enzymes from degrading endometrium
- On all target tissues:
  - Decrease E receptors (the "anti-estrogen" effect)
  - Decrease P receptors

## Premenstrual Syndrome (PMS)

- synonyms: “ovarian cycle syndrome,” “menstrual molimina” (moodiness)

### Etiology

- not completely understood, multifactorial, genetics likely play a role
- CNS-mediated neurotransmitter interactions with sex steroids (progesterone, estrogen and testosterone)
- serotonergic dysregulation – currently most plausible theory

### Diagnostic Criteria for Premenstrual Syndrome

- at least one affective and one somatic symptom during the 5 d before menses in each of the three prior menstrual cycles
  - affective: depression, angry outbursts, irritability, anxiety, confusion, social withdrawal
  - somatic: breast tenderness, abdominal bloating, headache, swelling of extremities
- symptoms relieved within 4 d of onset of menses
- symptoms present in the absence of any pharmacologic therapy, drug or alcohol use
- symptoms occur reproducibly during 2 cycles of prospective recording
- patient suffers from identifiable dysfunction in social or economic performance

### Treatment

- goal: symptom relief
- psychological support
- diet/supplements
  - avoid sodium, simple sugars, caffeine and alcohol
  - calcium (1200-1600 mg/d), magnesium (400-800 mg/d), vitamin E (400 IU/d), vitamin B<sub>6</sub>
- medications
  - NSAIDs for discomfort, pain
  - spironolactone for fluid retention: used during luteal phase
  - SSRI antidepressants: used during luteal phase x 14 d or continuously
  - OCP: primarily beneficial for physical/somatic symptoms
  - danazol: an androgen that inhibits the pituitary-ovarian axis
  - GnRH agonists if PMS is severe and unresponsive to treatment
- mind/body approaches
  - regular aerobic exercise
  - cognitive behavioural therapy
  - relaxation, light therapy biofeedback and guided imagery
- herbal remedies (variable evidence)
  - evening primrose oil, black cohosh, St. John's wort, kava, ginkgo, agnus castus fruit extract
- BSO if symptoms severe

### Premenstrual Syndrome

Physiological and emotional disturbances that occur 1-2 wk prior to menses and last until a few days after onset of menses. Common symptoms include depression, irritability, tearfulness and mood swings.

## Premenstrual Dysphoric Disorder (PMDD)

### Definition

- official diagnosis in the DSM-IV-TR
- described as a more severe form of PMS with specific diagnostic criteria
- treatment with SSRIs (first line), and Yaz® OCP (highly effective)

# Differential Diagnoses of Common Presentations

## Abnormal Uterine Bleeding (AUB)

- see *Disorders of Menstruation*, GY14
- definition: change in frequency, duration or amount of menstrual flow
- classified as amenorrhea, oligomenorrhea, menorrhagia/hypermenorrhea, hypomenorrhea, metrorrhagia, menometrorrhagia, polymenorrhea, postmenopausal bleeding
  - hypomenorrhea: bleeding that is decreased in amount
  - oligomenorrhea: bleeding occurring at intervals >35 d
  - polymenorrhea: bleeding occurring at intervals <21 d
  - menorrhagia/hypermenorrhea: bleeding at regular intervals that is prolonged in duration (>7 d) or excessive in amount (>80 cc per menstrual cycle)
  - metrorrhagia: bleeding at irregular intervals, particularly between expected menstrual periods
  - menometrorrhagia: excessive bleeding at usual time of menstrual periods and at other irregular intervals
  - postmenopausal bleeding: any bleeding that presents >1 yr after menopause; must rule out endometrial cancer

Postmenopausal bleeding is endometrial cancer until proven otherwise.

## Dysmenorrhea

- see *Disorders of Menstruation*, GY15
- primary/idiopathic
- secondary (acquired)
  - endometriosis
  - adenomyosis
  - uterine polyps
  - uterine anomalies (e.g. non-communicating uterine horn)
  - leiomyoma
  - intrauterine synechiae
  - ovarian cysts
  - cervical stenosis
  - imperforate hymen, transverse vaginal septum
  - pelvic inflammatory disease (PID)
  - IUD (copper)
  - foreign body

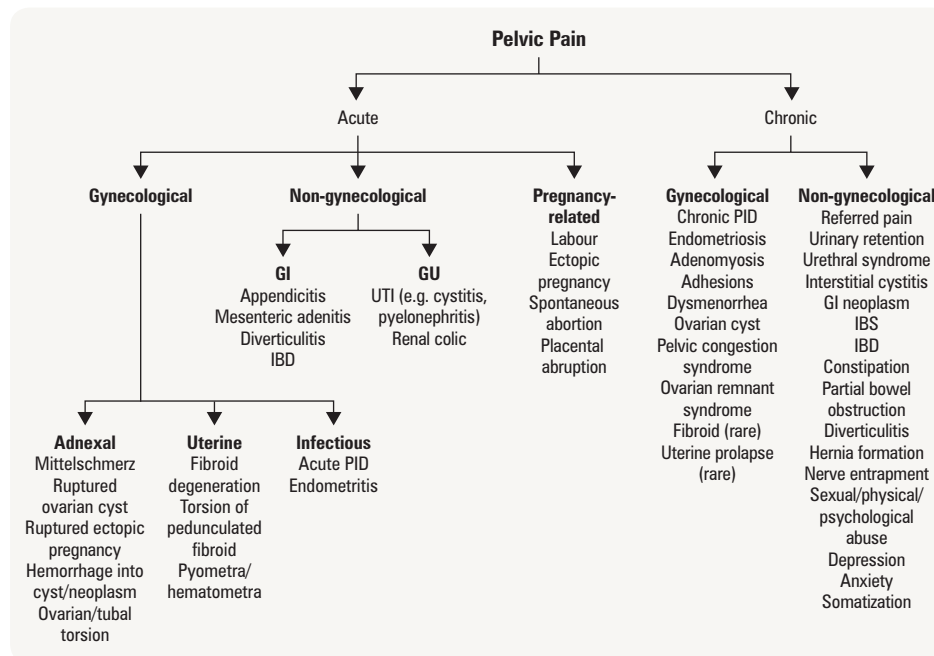

### Dysmenorrhea

Painful menstruation.

## Vaginal Discharge/Pruritus

- see *Gynecological Infections*, GY24
- physiologic discharge and cervical mucus production
- non-physiologic
  - genital tract infection
    - vulvovaginitis: candidiasis, trichomoniasis, bacterial vaginosis (BV), polymicrobial superficial infection
    - chlamydia, gonorrhea
    - pyosalpinx, salpingitis
  - genital tract inflammation (non-infectious)
  - local: chemical irritants, douches, sprays, foreign body, trauma, atrophic vaginitis, desquamative inflammatory vaginitis, focal vulvitis
  - neoplasia: vulvar, vaginal, cervical, endometrial
  - systemic: toxic shock syndrome, Crohn's disease, collagen disease, dermatologic (e.g. lichen sclerosis)
  - IUD, OCP (secondary to progesterone)

## Pelvic Pain

20% of chronic pelvic pain patients have a history of previous sexual abuse/assault. Remember to ask about it!

### Pyometra

Pus within the uterine cavity.

### Hematometra

Blood within the uterine cavity.

### Hydrometra

Fluid within the uterine cavity.

Figure 6. Approach to pelvic pain

## Pelvic Mass

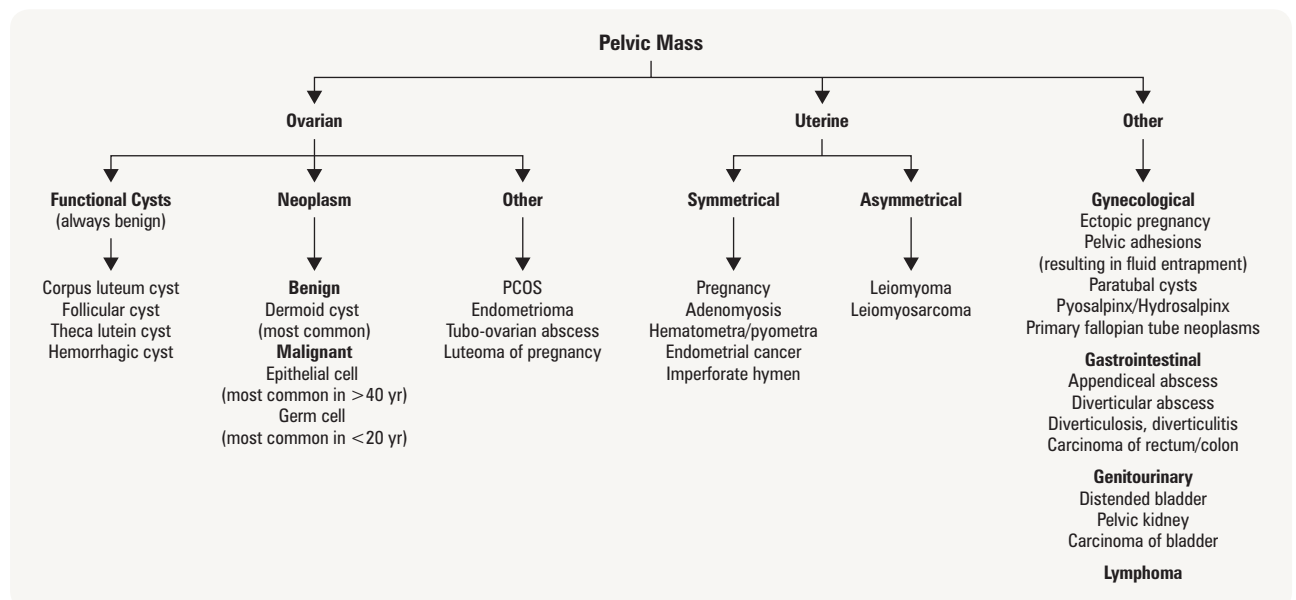

Figure 7. Differential diagnosis of pelvic mass

## Dyspareunia

**Dyspareunia**  
Painful intercourse.

Figure 8. Approach to dyspareunia

## Common Investigations

### Bloodwork

- CBC
  - evaluation of severity of abnormal uterine bleeding, pre-op investigation ± ferritin if anemic
- $\beta$ -hCG
  - investigation of possible pregnancy, ectopic pregnancy, ovarian germ cell tumour
  - work-up for GTD/GTN
  - monitored after medical management of ectopic pregnancy and GTN to assess for cure or recurrence
- LH, FSH, TSH, free  $T_4$ , prolactin, DHEA, testosterone, estradiol, androstenedione
  - investigation of amenorrhea, menstrual irregularities, menopause, infertility

Every woman of childbearing age presenting to ER with abdominal or pelvic pain should have  $\beta$ -hCG measured.

### Imaging

#### Ultrasound (U/S)

- transabdominal or transvaginal U/S is the imaging modality of choice for pelvic structures
- transvaginal U/S provides better resolution of uterus and adnexal structures
  - detects early pregnancy if  $\beta$ -hCG  $\geq 1500$  ( $\beta$ -hCG must be  $\geq 6500$  for transabdominal U/S)
- may be used to identify pelvic pathology
  - identify ectopic pregnancy, intrauterine pregnancy
  - assess uterine, adnexal, cul-de-sac, ovarian masses (e.g. solid or cystic)
  - determine endometrial thickness, locate/characterize fibroids
  - monitor follicles during assisted reproduction
  - assess endometrial lining in postmenopausal women

#### Sonohysterography (SHG)

- saline infusion into endometrial cavity expands endometrial cavity, improving visualization of uterus and fallopian tubes
- useful for investigation of:
  - abnormal uterine bleeding (AUB)
  - uncertain endometrial findings on transvaginal U/S
  - infertility (tubal patency)
  - congenital/acquired uterine abnormalities (e.g. fibroids, endometrial polyps)
- easily done, minimal cost, well-tolerated, sensitive and specific
- frequently avoids need for diagnostic hysteroscopy

Check for STIs before performing SHG and HSG to prevent PID in high-risk individuals. Consider pre-treatment with doxycycline.

#### Hysterosalpingography (HSG)

- x-ray contrast introduced through the cervix into the uterus
- used for evaluation of size, shape, configuration of uterus, congenital uterine abnormalities, tubal patency, or obstruction
- useful for investigation of infertility
- often replaced by sonohysterogram with Echovist® to look at tubes

## Common Procedures

### Genital Tract Biopsy

#### Vulvar Biopsy

- performed under local anesthetic
- Keyes/punch biopsy
- hemostasis achieved with local pressure and Monsel's solution (ferric sulfate), silver nitrate or suture (rarely)

#### Vaginal Biopsy and Cervical Biopsy

- anesthetic not necessary
- punch biopsy or biopsy forceps
- hemostasis with Monsel's solution and pressure

#### Endometrial Biopsy

- performed in the office using an endometrial suction curette (pipelle) guided through the cervix to aspirate fragments of endometrium
  - pre-treatment with misoprostol (Cytotec®) if nulliparous or postmenopausal
- more invasive procedure (D&C) may be done in the office or operating room ± hysteroscopy

### Colposcopy

- diagnostic use
  - magnifies surface structures of the vulva, vagina, cervix and perianal region
  - 1% acetic acid wash applied to cervix dehydrates cells and reveals "acetowhite" areas that correspond to increased nucleus-to-cytoplasm ratio (abnormal)
  - allows biopsy of acetowhite lesions for early identification of dysplasia and cancer
- therapeutic use
  - cryotherapy: nitrous oxide or carbon dioxide freezes dysplastic lesions, genital warts
  - laser vaporization: used to treat dysplastic lesions of the exocervix and benign ectropion
  - loop electrosurgical excision procedure (LEEP): excision of transformation zone with the cervical lesion; provides a specimen for pathological examination

### Vacuum Aspiration

- procedure to empty the contents of the uterus through a plastic or metal cannula (thin tube) attached to a vacuum source

#### Indications

- termination of pregnancy in 1<sup>st</sup> trimester

#### Manual Vacuum Aspiration (≤10 wk gestation)

- source of vacuum: hand-held, portable aspirator
- anesthesia: local (paracervical block) in most cases
- can be performed in an office setting
- suction curette connected to aspirator empties the uterus

#### Electric Vacuum Aspiration (≤13 wk gestation)

- source of vacuum: electric pump
- anesthesia: local (paracervical block) and conscious sedation or general anesthetic
- dilatation of cervix with dilators of increasing diameter
- suction curette connected to electric pump empties the uterus
- after aspiration, uterine cavity can be gently explored with sharp curette

#### Complications

- bleeding
- infection
- perforation of uterus, laceration of cervix
  - reduce risk with preprocedural cervical dilatation (misoprostol or osmotic dilators)
- retained products of conception
  - requires reaspiration, rare (2/1000)

## Dilatation and Curettage (D&C)

- determine depth with uterine sound prior to procedure
- dilatation of cervix with dilators of increasing diameter
- scrape entire uterine cavity with sharp curette
- anesthesia: general or local

### Indications

- diagnostic (rarely done without hysteroscopy)
  - abnormal uterine bleeding (AUB)
  - dysfunctional uterine bleeding (DUB)
- therapeutic
  - removal of retained products of conception following abortion
  - termination of pregnancy in 1st trimester
  - removal of small uterine polyps or pedunculated submucosal fibroids

### Complications

- bleeding
- infection
- perforation of uterus, laceration of cervix
  - reduce risk with preoperative misoprostol (Cytotec®) inserted per vagina to soften cervix and stimulate uterine contraction
- incompetent cervix – extremely rare
- Asherman's syndrome

## Laparoscopy

- laparoscope (fibre optic camera) used to view pelvic/abdominal contents through small incisions

### Indications

- diagnostic
  - evaluation of infertility, pelvic pain, pelvic masses, congenital anomalies, hemoperitoneum and endometriosis
- therapeutic
  - tubal ligation
  - lysis of adhesions
  - excision of ectopic pregnancy
  - excision/ablation of endometriosis
  - retrieval of lost IUDs
  - cystectomy, salpingo-oophorectomy and hysterectomy
  - myomectomy
  - treatment of stress urinary incontinence

### Contraindications

- bowel obstruction
- large hemoperitoneum
- clinically unstable patient
- inability to maintain pneumoperitoneum
- multiple previous abdominal surgeries (i.e. adhesions)

### Complications

- general anesthesia related
- insufflation of the preperitoneal abdominal wall
- injury to surrounding structures (e.g. aorta, inferior epigastric vessels, bowel, bladder, ureters)
- may need to convert to laparotomy
- infection

## Hysteroscopy

- flexible or rigid scope inserted through cervix into uterus to visualize uterine cavity
- distension medium is used to allow inspection of this potential space

### Indications

- diagnostic
  - detection of uterine anomalies or pathology (e.g. infertility work-up)
  - AUB
  - DUB
- therapeutic
  - removal of uterine polyps, fibroids, adhesions, septa
  - endometrial ablation

**Complications**

- perforation of uterus, laceration of cervix
- bleeding
- infection
- absorption of excess distension medium (when sugar solutions utilized, e.g. glucose, mannitol)
  - fluid overload, hyponatremia
  - procedure should be abandoned if the fluid deficit rises to 1 L; consider stopping at 500 cc
- air emboli
- anaphylactic shock

## Endometrial Ablation

- alternative invasive procedure to hysterectomy for treatment of AUB; performed as outpatient
- rationale is to coagulate or resect the endometrium basalis layer to prevent monthly build-up and reduce menstrual losses

**Methods**

- rollerball electrode coagulation or resection
- microwave endometrial ablation
- thermoablation (hot water), balloon ablation
- laser photocoagulation

**Complications**

- infection
- injury to pelvic viscera if uterus perforated
- hematometra
- absorption of excess distention medium → fluid overload, hyponatremia
- failure (i.e. bleeding/menorrhagia persists)
- recurrence of symptoms (~20% at 5 yr), may eventually require hysterectomy

## Hysterectomy

**Indications**

- uterine fibroids
- endometriosis, adenomyosis
- uterine prolapse
- pelvic pain
- AUB
- cancer (endometrium, ovaries, fallopian tubes, cervix)

**Complications**

- general anesthetic
- bleeding
- infection
- injury to other organs (ureter, bladder, rectum)
- loss of ovarian function (if ovaries removed, iatrogenic menopause)

**Approaches**

1. vaginal vs. abdominal
  - indications for vaginal approach: mobile uterus, uterine size <12 wk
  - advantages of vaginal approach: less pain, faster recovery time, allows for simultaneous repair of rectocele/cystocele/enterocele, improved aesthetics
2. open vs. laparoscopic-assisted
  - advantages of laparoscopy: less pain, faster recovery, improved aesthetics, shorter hospital stay
3. robotic
  - similar advantages to laparoscopy
  - more dexterous

**Approaches to Hysterectomy**

- Abdominal hysterectomy: uterus removed via transverse or vertical laparotomy
- Vaginal hysterectomy: uterus removed via vagina. No visualization or entry into abdomen unless laparoscopic-assisted
- Laparoscopic/Robotic: uterus removed via vagina or morcellation

Table 1. Classification of Hysterectomy

Classification	Tissues Removed	Indications
Subtotal hysterectomy	Uterus	Inaccessible cervix (e.g. adhesions) Patient choice/preference
Total hysterectomy (extrafascial simple hysterectomy/type 1)	Uterus, cervix, uterine artery ligated at uterus	Uterine fibroids Endometriosis Adenomyosis Menorrhagia DUB
Total hysterectomy (extrafascial simple hysterectomy/type 1) + bilateral salpingo-oophorectomy (TAH/BSO)	Uterus, cervix, uterine artery ligated at uterus, fallopian tubes, ovaries	Endometrial cancer Malignant adnexal masses >45 yr old Consider for endometriosis
Modified radical hysterectomy (type 2)	Uterus, cervix, proximal 1/3 parametria, uterine artery ligated medial to the ureter, mid point of uterosacral ligaments and upper 1-2 cm vagina	Cervical cancer (up to stage IBI, see Table 24)
Radical hysterectomy (type 3)	Uterus, cervix, upper 1/3-1/2 vagina, entire parametria, uterine artery ligated at its origin from internal iliac artery, uterosacral ligament at most distal attachment (rectum)	Cervical cancer

## Disorders of Menstruation

### Amenorrhea

#### Differential Diagnosis of Amenorrhea

Table 2. Differential Diagnosis of Primary Amenorrhea

With Secondary Sexual Development		Without Secondary Sexual Development	
<i>Normal breast and pelvic development</i>	<i>Normal breast, abnormal uterine development</i>	<i>High FSH (hypergonadotropic hypogonadism)</i>	<i>Low FSH (hypogonadotropic hypogonadism)</i>
Hypothyroidism Hyperprolactinemia PCOS Hypothalamic dysfunction	Androgen insensitivity Anatomic abnormalities • Müllerian agenesis, uterovaginal septum, imperforate hymen	Gonadal dysgenesis • Abnormal sex chromosome (Turner's XO) • Normal sex chromosome (46XX, 46XY)	Constitutional delay (most common) Congenital abnormalities • Isolated GnRH deficiency • Pituitary failure (Kallman syndrome, head injury, pituitary adenoma, etc.) Acquired • Endocrine disorders (T1DM) • Pituitary tumors • Systemic disorders (IBD, JRA, chronic infections, etc.)

Table 3. Differential Diagnosis of Secondary Amenorrhea

With Hyperandrogenism	Without Hyperandrogenism
PCOS Autonomous hyperandrogenism (androgen secretion independent of the HPO axis) • Ovarian: tumour, hyperthecosis • Adrenal androgen-secreting tumour Late onset or mild congenital adrenal hyperplasia (rare)	Hypergonadotropic hypogonadism (aka premature ovarian failure: high FSH, low estradiol) • Idiopathic • Autoimmune: T1DM, autoimmune thyroid disease, Addison's disease • Iatrogenic: cyclophosphamide drugs, radiation Hyperprolactinemia Endocrinopathies: most commonly hyper or hypothyroidism Hypogonadotropic hypogonadism (low FSH): • Pituitary compression or destruction: pituitary adenoma, craniopharyngioma, lymphocytic hypophysitis, infiltration (sarcoidosis), head injury, Sheehan's syndrome Functional hypothalamic amenorrhea (often related to stress excessive exercise and/or anorexia)

#### Primary Amenorrhea

No menses by age 14 in absence of 2° sexual characteristics or no menses by age 16 with 2° sexual characteristics.

#### Secondary Amenorrhea

No menses for >6 mo or 3 cycles after documented menarche.

#### Oligomenorrhea

Episodic vaginal bleeding occurring at intervals >35 d.

#### Prolactinoma Symptoms

Galactorrhea, visual changes, headache.

2° amenorrhea is pregnancy until proven otherwise.

Functional hypothalamic amenorrhea is the most common cause of amenorrhea.

## Investigations

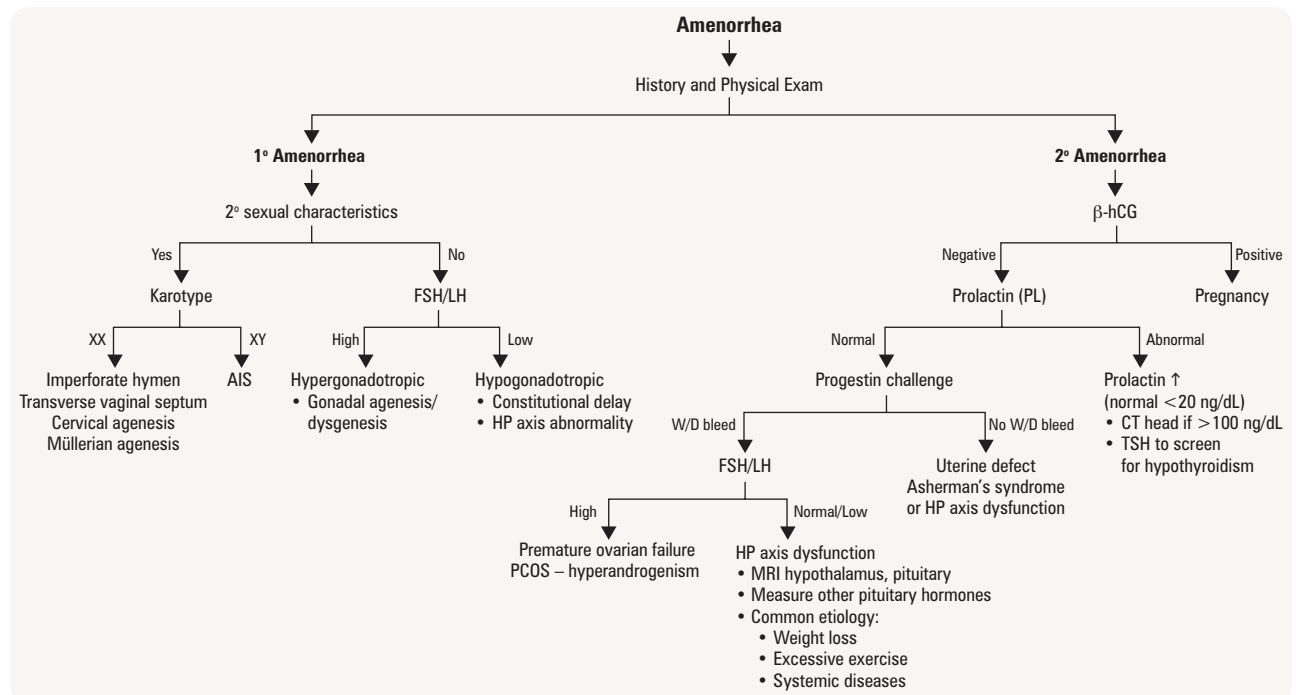

Figure 9. Diagnostic approach to amenorrhea

- $\beta$ -hCG, hormonal workup (TSH, prolactin, FSH, LH, androgens, estradiol)
- progesterone challenge to assess estrogen status
  - medroxyprogesterone acetate (Provera®) 10 mg PO OD for 10-14 d
  - any uterine bleed within 2-7 d after completion of Provera® is considered to be a positive test/withdrawal bleed
    - ♦ withdrawal bleed suggests presence of adequate estrogen to thicken the endometrium; thus withdrawal of progesterone results in bleeding
    - ♦ if no bleeding occurs, there may be inadequate estrogen (hypoestrogenism) or excessive androgens
- karyotype: indicated if premature ovarian failure or absent puberty
- U/S to confirm normal anatomy, identify PCOS

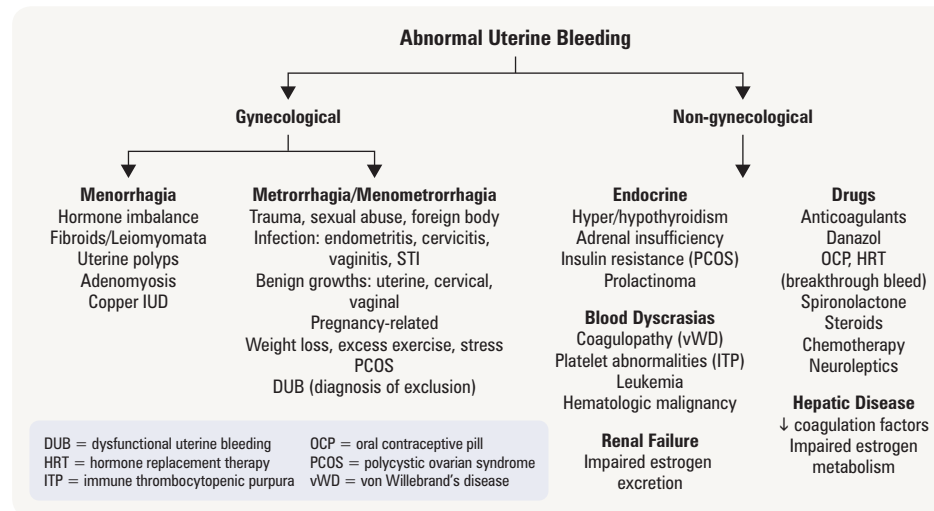

## Treatment

Table 4. Management of Amenorrhea

Etiology	Management
<b>1° AMENORRHEA</b>	
AIS	<ul style="list-style-type: none"> <li>• Gonadal resection after puberty</li> <li>• Psychological counselling</li> <li>• Creation of neo-vagina</li> </ul>
Anatomical <ul style="list-style-type: none"> <li>• Imperforate hymen</li> <li>• Transverse vaginal septum</li> <li>• Cervical agenesis</li> </ul>	<ul style="list-style-type: none"> <li>• Surgical management</li> </ul>
Müllerian dysgenesis (MRKH syndrome)	<ul style="list-style-type: none"> <li>• Psychological counselling</li> <li>• Creation of neo-vagina with dilation</li> <li>• Diagnostic study to confirm normal urinary system and spine</li> </ul>
<b>2° AMENORRHEA</b>	
Uterine defect <ul style="list-style-type: none"> <li>• Asherman's syndrome</li> </ul>	<ul style="list-style-type: none"> <li>• Evaluation with hysterosalpingography or sonohysterography</li> <li>• Hysteroscopy: excision of synechiae</li> </ul>
HP-axis dysfunction	<ul style="list-style-type: none"> <li>• Identify modifiable underlying cause</li> <li>• Combined OCP to decrease risk of osteoporosis, maintain normal vaginal and breast development</li> </ul>
Premature ovarian failure	<ul style="list-style-type: none"> <li>• Screen for diabetes mellitus, hypothyroidism, hypoparathyroidism, hypocortisolism</li> <li>• Hormonal therapy with estrogen + progestin to decrease risk of osteoporosis. Can use OCP</li> </ul>
Hyperprolactinemia	<ul style="list-style-type: none"> <li>• MRI/CT head to r/o lesion</li> <li>• If no demonstrable lesions by MRI:               <ul style="list-style-type: none"> <li>• Bromocriptine, cabergoline if fertility desired</li> <li>• Combined OCPs if no fertility desired</li> </ul> </li> <li>• Demonstrable lesions by MRI: surgical management</li> </ul>
Polycystic ovarian syndrome	

**Abnormal Uterine Bleeding**  
Change in frequency, duration or amount of menstrual flow.

**Figure 10. Approach to abnormal uterine bleeding**

**Table 5. Comparison of Anovulatory and Ovulatory Abnormal Uterine Bleeding**

	Anovulatory	Ovulatory
<b>Incidence</b>	90%	10%
<b>Definition</b>	Unpredictable endometrial bleeding of variable flow and duration; sex steroids are produced but not cyclically, resulting in irregular bleeding	Typically cyclic, but heavy or prolonged
<b>Etiology</b>	PCOS Thyroid dysfunction Elevated prolactin levels Rare estrogen-producing tumours Stress, weight loss, exercise Liver and kidney disease	Anatomic or physical lesion (e.g. polyp, fibroid, adenomyosis, neoplasm, foreign body) Hemostatic defect Infection; trauma Local disturbances in prostaglandins (elevated endomyometrial vasodilatory prostaglandin, decreased vasoconstrictive prostaglandin)
<b>Pathophysiology</b>	Estrogen-dependent breakthrough bleeding: chronic estrogen production unopposed by adequate progesterone production → continued proliferation of the endometrium → thickened endometrium outgrows its blood supply → focal necrosis with partial shedding not uniformly → bleeding is usually irregular, prolonged, and heavy	Depends on underlying etiology

### Investigations

- CBC, serum ferritin
- $\beta$ -hCG
- TSH, free  $T_4$
- coagulation profile (especially in adolescents): rule out von Willebrand's disease
- prolactin if amenorrheic
- FSH, LH
- serum androgens (especially free testosterone)
- day 21 (luteal phase) progesterone to confirm ovulation
- Pap test
- pelvic U/S: detect polyps, fibroids; measure endometrial thickness (postmenopausal)
- SHG: very sensitive for intrauterine pathology (polyps, submucous fibroids)
- HSG
- endometrial biopsy: consider biopsy in women >40 yr
  - must do endometrial biopsy in all women presenting with postmenopausal bleeding to exclude endometrial cancer
- D&C: not for treatment; diagnosis only (usually with hysteroscopy)

## Treatment

- treat underlying disorders
  - if anatomic lesions and systemic disease have been ruled out, consider dysfunctional uterine bleeding (DUB)
- medical
  - mild DUB (see sidebar)
    - ♦ NSAIDs
    - ♦ anti-fibrinolytic (e.g. Cyklokapron®) at time of menses
    - ♦ combined OCP
    - ♦ progestins (Provera®) on first 10-14 d of each month if oligomenorrheic
    - ♦ Mirena® IUD
    - ♦ danazol
  - acute, severe DUB
    - ♦ replace fluid losses, consider admission
    - ♦ a) estrogen (Premarin®) 25 mg IV q4h x 24h with Graval® 50 mg IV/PO q4h
    - ♦ b) Ovral®, or any OCP with minimum 50 µg estradiol 1 tab PO q4h x 24 h with Graval® 50 mg IV/PO q4h
      - taper Ovral® to 1 tab tid x 2 d → bid x 2 d → OD
    - ♦ after (a) or (b), maintain patient on monophasic OCP for next several months or consider alternative medical treatment
  - clomiphene citrate
    - ♦ consider in patients who are anovulatory and who wish to get pregnant
- surgical
  - endometrial ablation; consider pretreatment with danazol or GnRH agonists
    - ♦ if finished childbearing
    - ♦ repeat procedure may be required if symptom reoccurs
  - hysterectomy: definitive treatment

### Dysfunctional Uterine Bleeding

Abnormal bleeding not attributable to organic (anatomic/systemic) disease. DUB is a diagnosis of exclusion. Anovulatory AUB often used synonymously with DUB.

## Dysmenorrhea

### Etiology

- see *Differential Diagnoses of Common Presentations*, GY6

**Table 6. Comparison of Primary and Secondary Dysmenorrhea**

	Primary Dysmenorrhea	Secondary Dysmenorrhea
<b>Features</b>	Menstrual pain in absence of organic disease Begins 6 mo-2 yr after menarche (once ovulatory cycles established)	Menstrual pain due to organic disease Usually begins in women who are in their 20s, worsens with age May improve temporarily after childbirth
<b>Signs and Symptoms</b>	Colicky pain in abdomen, radiating to the lower back, labia, and inner thighs beginning hours before onset of bleeding and persisting for hours or days (48-72 h) Associated symptoms: nausea, vomiting, altered bowel habits, headaches, fatigue (prostaglandin-associated)	Associated dyspareunia, abnormal bleeding, infertility
<b>Diagnosis</b>	Associated dyspareunia, abnormal bleeding, infertility Rule out underlying pelvic pathology and confirm cyclic nature of pain	Bimanual exam: uterine or adnexal tenderness, fixed uterine retroflexion, uterosacral nodularity, pelvic mass, or enlarged irregular uterus (findings are rare in women <20 yr) U/S, laparoscopy and hysteroscopy may be necessary to establish the diagnosis
<b>Treatment</b>	PG synthetase inhibitors (e.g. Anaprox®): should be started before onset of pain OCP: suppress ovulation/reduce menstrual flow	Treat underlying cause

### Primary Dysmenorrhea

Menstrual pain in absence of organic disease.

### Secondary Dysmenorrhea

Menstrual pain due to organic disease.

# Endometriosis

## Etiology

- not fully understood
- proposed mechanisms (combination likely involved)
  - retrograde menstruation (Sampson's theory)
    - ♦ seeding of endometrial cells by transtubal regurgitation during menstruation
    - ♦ endometrial cells most often found in dependent sites of the pelvis
  - immunologic theory: altered immunity may limit clearance of transplanted endometrial cells from pelvic cavity (may be due to decreased NK cell activity)
  - metaplasia of coelomic epithelium
    - ♦ undefined endogenous biochemical factor may induce undifferentiated peritoneal cells to develop into endometrial tissue
  - extrapelvic disease may be due to aberrant vascular or lymphatic dissemination of cells
    - ♦ e.g. ovarian endometriosis may be due to direct lymphatic flow from uterus to ovaries

## Epidemiology

- incidence: 15-30% of pre-menopausal women
- mean age at presentation: 25-30 yr
- regresses after menopause

## Risk Factors

- family history (7-10 fold increased risk if affected 1st degree relative)
- obstructive anomalies of the genital tract (earlier onset) – resolve with treatment of anomaly
- nulliparity
- age >25 yr

## Sites of Occurrence

- ovaries: 60% patients have ovarian involvement
- broad ligament, vesicoperitoneal fold
- peritoneal surface of the cul-de-sac, uterosacral ligaments
- rectosigmoid colon, appendix
- rarely may occur in sites outside abdomen/pelvis, including lungs

## Clinical Features

- may be asymptomatic
- history
  - menstrual symptoms
    - ♦ cyclic symptoms due to growth and bleeding of ectopic endometrium, usually precede menses (24-48 h) and continue throughout and after flow
    - ♦ secondary dysmenorrhea
    - ♦ sacral backache with menses
    - ♦ pain may eventually become chronic, worsening perimenstrually
    - ♦ premenstrual and postmenstrual spotting
    - ♦ deep dyspareunia
  - infertility
    - ♦ 30-40% of patients with endometriosis will be infertile
    - ♦ 15-30% of those who are infertile will have endometriosis
  - bowel and bladder symptoms
    - ♦ frequency, dysuria, hematuria
    - ♦ diarrhea, constipation, hematochezia, dyschezia
- physical
  - tender nodularity of uterine ligaments and cul-de-sac felt on rectovaginal exam
  - fixed retroversion of uterus
  - firm, fixed adnexal mass (endometrioma)
  - physical findings not present in adolescent population

## Investigations

- definitive diagnosis requires:
  - direct visualization of lesions typical of endometriosis at laparoscopy
  - biopsy and histologic exam of specimens (2 or more of: endometrial epithelium, glands, stroma, hemosiderin-laden macrophages)
- laparoscopy
  - mulberry spots: dark blue or brownish-black implants on the uterosacral ligaments, cul-de-sac or anywhere in the pelvis
  - endometrioma: "chocolate" cysts on the ovaries
  - "powder-burn" lesions on the peritoneal surface
  - early white lesions and clear blebs
  - peritoneal "pockets"
- CA-125
  - may be elevated in patients with endometriosis

### Endometriosis

The presence of endometrial tissue (glands and stroma) outside of the uterine cavity.

### Differential Diagnoses

- Chronic PID, recurrent acute salpingitis
- Hemorrhagic corpus luteum
- Benign/malignant ovarian neoplasm
- Ectopic pregnancy

### Endometrioma

Endometriotic cyst on surface of ovary.

There may be little correlation between the extent of endometriosis and symptomatology.

### Classic Triad of Endometriosis

- Dysmenorrhea
- Dyspareunia (cul de sac, uterosacral ligament)
- Dyschezia (uterosacral ligament, cul-de-sac, rectosigmoid attachment)

A sharp, firm, and exquisitely tender "barb" on the uterosacral ligament is a classic feature of endometriosis.

### Treatment

- depends on certainty of the diagnosis, severity of symptoms, extent of disease, desire for future fertility and impact to GI/GU systems (e.g. intestinal obstruction)
- medical
  - NSAIDs (e.g. naproxen sodium – Anaprox®)
  - pseudopregnancy
    - ♦ cyclic/continuous estrogen-progestin (OCP)
    - ♦ medroxyprogesterone (Depo-Provera®)
    - ♦ dienogest (Visanne®)
  - pseudomenopause
    - ♦ 2nd line: only short-term (<6 mo) due to osteoporotic potential with prolonged use, unless combined with add-back therapy (e.g. estrogen/progesterone or SERM). If long-term use required, add-back estrogen+progesterone
    - ♦ danazol (Danocrine®): weak androgen
      - side effects: weight gain, fluid retention, acne, hirsutism, voice change
    - ♦ leuprolide (Lupron®): GnRH agonist (suppresses pituitary)
      - side effects: hot flashes, vaginal dryness, reduced libido
      - can use ≥12 mo with add-back progestin or estrogen
- surgical
  - conservative laparoscopy using laser, electrocautery ± laparotomy
    - ♦ ablation/resection of implants, lysis of adhesions, ovarian cystectomy of endometriomas
  - definitive: bilateral salpingo-oophorectomy ± hysterectomy
  - ± follow-up with medical treatment for pain control not shown to impact on preservation of fertility
  - best time to become pregnant is immediately after conservative surgery

Endometriosis is classified according to a scoring system standardized by the American Society for Reproductive Medicine. Score is based on location and extent of disease.

#### Recurrence Rates

Medical therapy: 30-50%  
Conservative surgery: 14-40%

## Adenomyosis

- synonym: “endometriosis interna” (uterine wall may be diffusely involved)

### Epidemiology

- 15% of females >35 yr old; found in 20-40% of hysterectomy specimens
- mean age at presentation: 40-50 yr old (older age group than seen in endometriosis)
- adenomyosis is a common histologic finding in asymptomatic patients

### Clinical Features

- often asymptomatic
- menorrhagia, secondary dysmenorrhea, pelvic discomfort
- dyspareunia, dyschezia
- uterus symmetrically bulky, usually <14 cm, mobility not restricted, no associated adnexal pathology
- Halban sign: tender, softened uterus on premenstrual bimanual exam

### Investigations

- clinical diagnosis
- U/S or MRI can be helpful
- endometrial sampling to rule out other pathology

### Treatment

- iron supplements as necessary
- analgesics, NSAIDs
- OCP, medroxyprogesterone (Depo-Provera®)
- low dose danazol 100-200 mg PO OD (trial x 4 mo)
- GnRH agonists (e.g. leuprolide)
- definitive: hysterectomy (no conservative surgical treatment)

#### Adenomyosis

Extension of areas of endometrial glands and stroma into the myometrium.

Final diagnosis of adenomyosis is based on pathologic findings, but predictably identified on MRI.

#### Leiomyomata/Fibroids

Benign smooth muscle tumour of the uterus (most common gynecological tumour).

## Leiomyomata (Fibroids)

### Epidemiology

- diagnosed in approximately 40-50% of pre-menopausal women >35 yr
- more common in African Americans, where they are also larger and occur at earlier age
- common indication for major surgery in females
- minimal malignant potential (1:1000)
- typically regress after menopause; enlarging fibroids in a postmenopausal woman should prompt consideration of malignancy
  - 50% of leiomyosarcomas originate from within fibroids

Submucosal leiomyomata are most symptomatic (bleeding, infertility).

AUB in women >40 yr requires an endometrial biopsy to r/o cancer even if known to have fibroids.

### Pathogenesis

- estrogen stimulates monoclonal smooth muscle proliferation
- progesterone stimulates production of proteins that inhibit apoptosis
- degenerative changes (occur when tumour outgrows blood supply)
  - hyaline degeneration (most common degenerative change)
  - cystic degeneration (from breakdown of hyaline)
  - red/carneous degeneration (hemorrhage into tumour, may occur in pregnancy)
  - fatty degeneration
  - calcification
  - sarcomatous degeneration (rare)
- parasitic myoma: tumour becomes attached to another organ (typically omentum or small bowel mesentery), develops new blood supply and loses connection to uterus

### Clinical Features

- majority asymptomatic (60%), often discovered as incidental finding on pelvic exam or U/S
- abnormal uterine bleeding (30%): dysmenorrhea, menorrhagia
- pressure/bulk symptoms (20-50%)
  - pelvic pressure/heaviness
  - increased abdominal girth
  - urinary frequency and urgency
  - acute urinary retention (extremely rare but surgical emergency!)
  - constipation, bloating (rare)
- acute pelvic pain
  - fibroid degeneration
  - fibroid torsion (pedunculated subserosal)
- infertility, recurrent pregnancy loss
- pregnancy complications (potential enlargement and increased pain, obstructed labour, difficult C-section)

### Investigations

- bimanual exam: uterus asymmetrically enlarged, usually mobile
- CBC: anemia
- U/S: to confirm diagnosis and assess location of fibroids
- sonohysterogram: useful for differentiating endometrial polyps from submucosal fibroids, or if intracavitary growth
- endometrial biopsy to rule out uterine cancer for abnormal uterine bleeding (especially if age >40 yr)
- occasionally MRI is used for pre-op planning (e.g. before myomectomy)

### Treatment

- only if symptomatic, rapidly enlarging, if menorrhagia or menometrorrhagia, if intracavitary
- treat anemia if present
- conservative approach (watch and wait) if:
  - symptoms absent or minimal
  - fibroids <6-8 cm or stable in size
  - not submucosal (submucosal fibroids are more likely to be symptomatic)
  - currently pregnant due to increased risk of bleeding (follow-up U/S if symptoms progress)
- medical approach
  - antiprostaglandins (ibuprofen, other NSAIDs)
  - tranexamic acid (Cyklokapron®)
  - OCP/Depo-Provera®
  - GnRH agonist: leuprolide (Lupron®), danazol (Danocrine®)
    - ♦ short-term use only (6 mo)
    - ♦ often used pre-myomectomy or pre-hysterectomy to reduce fibroid size
    - ♦ reduced bleeding
  - ulipristal acetate: a partial progesterone receptor agonist
- interventional radiology approach
  - uterine artery embolization (occludes both uterine arteries) → shrinks fibroids by 50% at 6 mo; improves menorrhagia in 90% of patients within 1-2 mo; not an option in women considering childbearing
- surgical approach
  - myomectomy (hysteroscopic, transabdominal or laparoscopic): preserves fertility
  - hysteroscopic resection of fibroid and endometrial ablation for menorrhagia
  - hysterectomy (see *Hysterectomy*, GY11)
  - note: avoid operating on fibroids during pregnancy (due to ↑ vascularity and potential pregnancy loss); expectant management usually best

**Figure 11. Possible anatomic locations of uterine leiomyomata**

The effect of pregnancy on fibroid size is variable.

#### Ulipristal Acetate versus Leuprolide Acetate for Uterine Fibroids

NEJM 2012;366:421-432

**Study:** Phase III, double-blind RCT of the efficacy and side-effect profile of ulipristal acetate versus those of leuprolide acetate for the treatment of symptomatic uterine fibroids before surgery.

**Outcomes:** Control of uterine bleeding at week 13 was the primary outcome. Secondary outcomes included bleeding pattern, amenorrhea, changes in fibroid/uterine volume, and global pain score.

**Patients:** 307 premenopausal women with symptomatic fibroids and excessive uterine bleeding were randomly assigned to oral ulipristal acetate (5 mg or 10 mg) or intramuscular injections of leuprolide acetate.

**Results:** Control of bleeding at week 13 was not significantly different between the treatment groups. All three treatments reduced uterine volume, although this decrease was significantly greater in the leuprolide group (47% reduction) than in the ulipristal groups (20-22%). 40% of the leuprolide group reported moderate-to-severe hot flashes, but only 11% (5 mg) and 10% (10 mg) of the ulipristal groups did.

**Conclusions:** Oral ulipristal acetate (5 mg or 10 mg) is noninferior to intramuscular leuprolide acetate for control of uterine bleeding due to fibroids, and it had a better side-effect profile.

#### Suppression of Ovarian Activity with a Drospirenone-Containing Oral Contraceptive in a 24/4 Regimen

Contraception 2008;78:16-25

**Study:** Double-blind randomized.

**Patients:** Women aged 18-35 yr, post-ovulation or had a follicular diameter ≥15 mm before day 23 during a pre-treatment cycle.

**Intervention:** Drospirenone 3 mg plus ethinyl estradiol 20 µg administered in 24/4 regimen vs. 21/7 regimen.

**Outcome:** Suppression of ovarian activity (Hoogland score).

**Results:** Women on a 24/4 regimen had greater and more consistent ovarian suppression than the 21/7 group. More women in the 24/4 group had no ovarian activity compared to women in the 21/7 group.

**Conclusion:** A 24/4 regimen is associated with greater ovarian suppression than a 21/7 regimen.

# Contraception

- see [Family Medicine](#), FM20

**Table 7. Classification of Contraceptive Methods**

Type	Effectiveness (perfect use, typical use)
<b>Physiological</b>	
Withdrawal/coitus interruptus	77%
Rhythm method/calendar/mucus/symptothermal	98%, 76%
Lactational amenorrhea	98% (first 6 mo postpartum)
Chance – no method used	10%
Abstinence of all sexual activity	100%
<b>Barrier Methods</b>	
Condom alone	98%, 85%
Spermicide alone	82%, 71%
Sponge – Parous	80%, 68%
– Nulliparous	91%, 84%
Diaphragm with spermicide	94%, 84%
Female condom	95%, 79%
Cervical cap – Parous	74%, 68%
– Nulliparous	91%, 84%
<b>Hormonal</b>	
OCP	99.7%, 92%
Nuva Ring®	99.7%, 92%
Transdermal (Ortho Evra®)	99.7%, 92%
Depo-Provera®	99.7%, 97%
Progestin-only pill (Micronor®)	90-99%
Mirena® IUD	99.9%
<b>Copper IUD</b>	99.3%
<b>Surgical</b>	
Tubal ligation	99.65%
Vasectomy	99.9%
<b>Emergency Postcoital Contraception (EPC)</b>	
Yuzpe® method	98% (within 24 h), decreases by 30% at 72 h
“Plan B” levonorgestrel only	98% (within 24 h), decreases by 70% at 72 h
Postcoital IUD	99.9%

Effectiveness: percentage of women reporting no pregnancy after 1 yr of use.

## Hormonal Methods

### Combined Oral Contraceptive Pills (OCPs)

- most contain low dose ethinyl estradiol (20-35 µg) plus progestin (norethindrone, norgestrel, levonorgestrel, desogestrel, norgestimate, drospirenone)
- failure rate (0.3% to 8%) depending on compliance
- monophasic or triphasic formulations (varying amount of progestin throughout cycle)

### Transdermal (Ortho Evra®)

- continuous release of 6 mg norelgestromin and 0.60 mg ethinyl estradiol into bloodstream
- applied to lower abdomen, back, upper arm, buttocks, NOT breast
- worn for 3 consecutive weeks (changed every wk) with 1 wk off to allow for menstruation
- as effective as OCP in preventing pregnancy (>99% with perfect use)
- may be less effective in women >90 kg
- may not be covered by drug plans

### Contraceptive Ring (Nuva Ring®)

- thin flexible plastic ring; releases etonogestrel 120 µg/d and estradiol 15 µg/d
- works for 3 wk then removed for 1 wk to allow for menstruation
- as effective as OCP in preventing pregnancy (98%)
- avoids first pass effect
- side effects: vaginal infections/irritation, vaginal discharge
- may have better cycle control; i.e. decreased breakthrough bleeding

### Starting Hormonal Contraceptives

- thorough history and physical examination, including blood pressure and breast exam
- follow-up visit 6 wk after hormonal contraceptives prescribed
- pelvic exam can be delayed until a subsequent visit

### Counselling the Adolescent about Contraception

More than 90% of adolescent pregnancies are unintended, and ~50% of all pregnancies occur within the first 6 mo of initiating sexual activity. In addition, 85% of sexually active women become pregnant within 1 yr if no contraception is used and even some of the least effective contraceptive methods markedly decrease the risk of pregnancy.

### Oral Contraceptives and the Risk of Venous Thromboembolism: An Update (2010)

*J Obstet Gyn Canada* 2010;32:1192-1197

#### Rates of venous thromboembolism

(VTE: DVT and PE) expressed in women/yr  
 Non-users of reproductive age 4-5/10 000  
 Oral contraceptive (OCP) users\* 9-10/10 000  
 Pregnancy 29/10 000  
 Immediate post-partum 300-400/10 000  
 \* Risk is highest in the first months of use and in medication switch.

#### Effect of ethinyl estradiol dose

ALL OCPs with ≤35 µg ethinyl estradiol carry a lower risk of VTE compared with oral contraceptives with 50 µg.

#### Effect of progestin type

*Drospirenone*: third generation progestin, e.g. Yasmin® and Yaz®  
*Levonorgestrel*: second generation progestin, e.g. Alesse®

Two high quality research studies found comparable VTE rates with drospirenone-containing OCPs and other approved products.

1. Dinger et al., *Contraception* 2007;75:344-354
2. Seeger et al., *Obstet Gynecol* 2007;110:587-593

Two reports with significant methodological flaws found increased VTE risk. Results and conclusions may have been distorted by residual confounding.

1. Lidegaard et al., *BMJ* 2009;339:b2890
2. Van Hylckama Vlieg et al., *BMJ* 2009;339:b2921

#### Conclusion

- Occurrence of serious risks, such as VTE, is rare with all contemporary OCPs.
- Individualized risk assessment is mandatory.
- For most healthy women of reproductive age, the benefits of OCPs will outweigh the risks.

### Risk of Non-Fatal Venous Thromboembolism in Women Using Oral Contraceptives Containing Drospirenone Compared with Women Using Oral Contraceptives Containing Levonorgestrel: A Case-Control Study Using United States Claims Data

*BMJ* 2011;342:d2151

**Study:** Nested case-control and cohort study. Patients: Women aged 15-44 yr receiving oral contraceptives.

**Intervention:** Drospirenone-containing contraceptive vs. Levonorgestrel-containing contraceptive.

**Outcome:** Non-fatal venous thromboembolism.

**Results:** Women receiving drospirenone-containing oral contraceptives were two times as likely to develop non-fatal VTE compared to women receiving levonorgestrel-containing contraceptives (age adjusted incidence rate ratio was 2.8).

**Table 8. Combined Estrogen and Progestin Contraceptive Methods**

Mechanism of Action	Advantages	Side Effects	Contraindications
<ul style="list-style-type: none"> <li>Ovulatory suppression through inhibition of LH and FSH</li> <li>Decidualization of endometrium</li> <li>Thickening of cervical mucus resulting in decreased sperm penetration</li> </ul>	<ul style="list-style-type: none"> <li>Highly effective</li> <li>Reversible</li> <li>Cycle regulation</li> <li>Decreased dysmenorrhea and menorrhagia (less anemia)</li> <li>Decreased benign breast disease and ovarian cyst development</li> <li>Decreased risk of ovarian and endometrial cancer</li> <li>Increased cervical mucus which may lower risk of STIs</li> <li>Decreased PMS symptoms</li> <li>Improved acne</li> <li>Osteoporosis protection (possibly)</li> </ul>	<p><b>Estrogen-related</b></p> <ul style="list-style-type: none"> <li>Nausea</li> <li>Breast changes (tenderness, enlargement)</li> <li>Fluid retention/bloating/edema</li> <li>Weight gain (rare)</li> <li>Migraine, headaches</li> <li>Thromboembolic events</li> <li>Liver adenoma (rare)</li> <li>Breakthrough bleeding (low estradiol levels)</li> </ul> <p><b>Progestin-related</b></p> <ul style="list-style-type: none"> <li>Amenorrhea/breakthrough bleeding</li> <li>Headaches</li> <li>Breast tenderness</li> <li>Increased appetite</li> <li>Decreased libido</li> <li>Mood changes</li> <li>Hypertension</li> <li>Acne/oily skin*</li> <li>Hirsutism*</li> </ul> <p>* Androgenic side effects may be minimized by prescribing formulations containing desogestrel, norgestimate, drospirenone or cyproterone acetate</p>	<p><b>Absolute</b></p> <ul style="list-style-type: none"> <li>Known/suspected pregnancy</li> <li>Undiagnosed abnormal vaginal bleeding</li> <li>Prior thromboembolic events, thromboembolic disorders (Factor V Leiden mutation; protein C, S or antithrombin III deficiency), active thrombophlebitis</li> <li>Cerebrovascular or coronary artery disease</li> <li>Estrogen-dependent tumours (breast, uterus)</li> <li>Impaired liver function associated with acute liver disease</li> <li>Congenital hypertriglyceridemia</li> <li>Smoker age &gt;35 yr</li> <li>Migraines with focal neurological symptoms (excluding aura)</li> <li>Uncontrolled hypertension</li> </ul> <p><b>Relative</b></p> <ul style="list-style-type: none"> <li>Migraines (non-focal with aura &lt;1 h)</li> <li>Diabetes mellitus complicated by vascular disease</li> <li>SLE</li> <li>Controlled hypertension</li> <li>Hyperlipidemia</li> <li>Sickle cell anemia</li> <li>Gallbladder disease</li> </ul> <p><b>Drug Interactions/Risks</b></p> <ul style="list-style-type: none"> <li>Rifampin, phenobarbital, phenytoin and primidone can decrease efficacy, requiring use of back-up method</li> <li>No evidence of fetal abnormalities if conceived on OCP</li> <li>No evidence that OCP is harmful to nursing infant but may decrease milk production. Not recommended until 6 wk postpartum, ideally until 3 mo postpartum</li> </ul>

Reference: World Health Organization Guidelines for Oral Contraceptive Pill Use

**Table 9. Selected Examples of OCPs**

Type	Active Compounds (estriol and progestin derivative)	Advantages	Disadvantages
<b>Alesse®</b>	17 µg ethinyl estradiol and 0.5 mg levonorgestrel	<ul style="list-style-type: none"> <li>Low-dose therefore often a good starting OCP</li> <li>Can improve acne and help regulate menstrual cycles</li> </ul>	<ul style="list-style-type: none"> <li>Low-dose pills can often result in breakthrough bleeding</li> <li>If this persists for longer than 3 mo, patient should be switched to an OCP with higher estrogen content</li> </ul>
<b>Tri-cyclen®</b>	35 µg ethinyl estradiol and 0.180/0.215/0.250 mg norgestimate Triphasic oral contraceptive (graduated levels of progesterone)	<ul style="list-style-type: none"> <li>Low androgenic activity can help with acne</li> </ul>	<ul style="list-style-type: none"> <li>Triphasic OCPs should not be used continuously (unlike monophasic formulations), although should be used continuously for 1 pack</li> </ul>
<b>Yasmin® and Yaz®</b>	<ul style="list-style-type: none"> <li>Yasmin®: 30 µg ethinyl estradiol + 3 mg drospirenone (a new progestin)</li> <li>Yaz®: 20 µg ethinyl estradiol + 3 mg drospirenone – 24/4-d pill (4 d pill free interval)</li> <li>Drospirenone has antimineralocorticoid activity and antiandrogenic effects</li> </ul>	<ul style="list-style-type: none"> <li>Decreased perception of cyclic weight gain/bloating</li> <li>Fewer PMS symptoms</li> <li>Improved acne</li> </ul>	<ul style="list-style-type: none"> <li>Hyperkalemia (rare, contraindicated in renal and adrenal insufficiency)</li> <li>Check potassium if patient also on ACE inhibitor, ARB, K<sup>+</sup>-sparing diuretic, heparin</li> <li>Continue use of spironolactone</li> <li>Increased risk of DVT-PE</li> </ul>

Irregular breakthrough bleeding often occurs in the first few months after starting OCP. Usually resolves after three cycles.

**Missed Combined OCPs**

Miss 1 pill in <24 h

- Take 1 pill ASAP, and the next pill at the usual time

Miss ≥1 pill in a row in first wk

- Take 1 pill ASAP, and continue taking one pill daily until the end of the pack
- Use back-up contraception for 7 d. EPC may be necessary

Miss <3 pills in 2nd or 3rd wk of cycle

- Take 1 pill ASAP, and continue taking one pill daily until the end of the pack
- Do not take placebo (28-d packs) or do not take a hormone free interval (21-d packs)
- Start the next pack immediately after finishing the previous one
- No need for back-up contraception

Miss ≥3 pills during the 2nd or 3rd wk

- Take 1 pill ASAP, and continue taking one pill daily until the end of the pack.
- Don't take placebo (28-d packs) or do not take a hormone free interval (21-d packs)
- Start the next pack immediately after finishing the previous one
- Use back-up contraception for 7 d. EPC may be necessary.

S. SOGC Committee Opinion on Missed Hormonal Contraceptives: New Recommendations.  
JOGC 2008;30:1050-1062. <http://www.sogc.org/guidelines/documents/gui219EC00811.pdf>

**PROGESTIN-ONLY METHOD****Table 10. Progestin Only Contraceptive Methods**

Indications	Mechanism of Action	Side Effects	Contraindications
<ul style="list-style-type: none"> <li>Suitable for postpartum women (does not affect breast milk supply)</li> <li>Women with contraindications to combined OCP (e.g. thromboembolic or myocardial disease)</li> <li>Women intolerant of estrogenic side effects of combined OCPs</li> </ul>	<ul style="list-style-type: none"> <li>Progestin prevents LH surge</li> <li>Thickening of cervical mucus</li> <li>Decrease tubal motility</li> <li>Endometrial decidualization</li> <li>Ovulation suppression – oral progestins (not IM) do not consistently suppress compared to combined OCPs</li> </ul>	<ul style="list-style-type: none"> <li>Irregular menstrual bleeding</li> <li>Weight gain</li> <li>Headache</li> <li>Breast tenderness</li> <li>Mood changes</li> <li>Functional ovarian cysts</li> <li>Acne/oily skin</li> <li>Hirsutism</li> </ul>	<p><b>Absolute</b></p> <ul style="list-style-type: none"> <li>None</li> </ul>

## Selected Examples of Progestin-Only Methods

### Progestin-Only Pill ("minipill")

- Micronor® 0.35 mg norethindrone
- taken daily at same time of day to ensure reliable effect; no pill free interval
- higher failure rate (1.1-13% with typical use, 0.51% with perfect use) than other hormonal methods
- ovulation inhibited in 60% of women; most have regular cycles (but may cause oligo/amenorrhea)
- highly effective if also post-partum breastfeeding, or if >35 yr

### Depo-Provera®

- injectable depot medroxyprogesterone acetate
- dose 150 mg IM q12-14wk (convenient dosing)
- initiate within 5 d of beginning of normal menses, immediately postpartum in breastfeeding and non-breastfeeding women
- irregular spotting progresses to complete amenorrhea in 70% of women (after 1-2 yr of use)
- highly effective 99%; failure rate 0.3%
- side effect: decreased bone density (may be reversible)
- disadvantage: restoration of fertility may take up to 1-2 yr

### Missed Progestin-Only Pills >3 hours

Use back-up contraceptive method for at least 48 h. Continue to take remainder of pills as prescribed.

### Missed Depo-Provera

- If last injection given 13-14 wk prior: give next injection immediately
- if >14 wk prior, do  $\beta$ -hCG
  - If  $\beta$ -hCG is positive, give EPC and no injection
  - If  $\beta$ -hCG is negative, give next injection right away and:
    - Intercourse occurred in last 5 d: give EPC, use back-up contraception for 7 d. Repeat  $\beta$ -hCG in 3 wk
    - Intercourse occurred >5 d ago but within the last 14 d: use back-up contraception for 7 d. Repeat  $\beta$ -hCG in 3 wk
    - Intercourse occurred >14 d ago: use back-up contraception for 7 d
- No evidence of fetal abnormalities if conceived on DMPA

S. SOGC Committee Opinion on Missed Hormonal Contraceptives: New Recommendations.

JOGC 2008;30:1050-62. <http://www.sogc.org/guidelines/documents/gui219EC00811.pdf>

## Intrauterine Device (IUD)

Table 11. IUD Contraceptive Methods

Mechanism of Action	Side Effects	Contraindications
<ul style="list-style-type: none"> <li>• <b>Copper-containing IUD (Nova-T®):</b> mild foreign body reaction in endometrium toxic to sperm and alters sperm motility</li> <li>• <b>Progesterone-releasing IUD (Mirena®):</b> decidualization of endometrium and thickening of cervical mucus; minimal effect on ovulation</li> <li>• Highly effective (95-99%); failure rate 0-1.2%</li> <li>• Contraceptive effects last 5 yr</li> <li>• Reversible, private, convenient</li> <li>• May be used in women with contraindications to OCPs or wanting long-term contraception</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Both Copper and Progesterone IUD</b> <ul style="list-style-type: none"> <li>• Breakthrough bleeding</li> <li>• Expulsion (5% in the first year, greatest in first month and in nulliparous women)</li> <li>• Uterine wall perforation (1/1000) on insertion</li> <li>• If pregnancy occurs with an IUD, increased risk of ectopic</li> <li>• Increased risk of PID (within first 10 d of insertion only)</li> </ul> </li> <li>• <b>Copper IUD:</b> increased blood loss and duration of menses, dysmenorrhea</li> <li>• <b>Progesterone IUD:</b> bloating, headache</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Absolute</b> <ul style="list-style-type: none"> <li>• <b>Both Copper and Progesterone IUD</b> <ul style="list-style-type: none"> <li>• Known or suspected pregnancy</li> <li>• Undiagnosed genital tract bleeding</li> <li>• Acute or chronic PID</li> <li>• Lifestyle risk for STIs*</li> </ul> </li> <li>• <b>Copper IUD:</b> <ul style="list-style-type: none"> <li>• Known allergy to copper</li> <li>• Wilson's disease</li> </ul> </li> </ul> </li> <li>• <b>Relative</b> <ul style="list-style-type: none"> <li>• <b>Both Copper and Progesterone IUD</b> <ul style="list-style-type: none"> <li>• Valvular heart disease</li> <li>• Past history of PID or ectopic pregnancy</li> <li>• Presence of prosthesis</li> <li>• Abnormalities of uterine cavity, intracavitary fibroids</li> <li>• Cervical stenosis</li> <li>• Immunosuppressed individuals (e.g. HIV)</li> </ul> </li> <li>• <b>Copper IUD:</b> severe dysmenorrhea or menorrhagia</li> </ul> </li> </ul>

\*Cervical swabs for gonorrhea and chlamydia should be done prior to IUD insertion

### Medroxyprogesterone (Depo-Provera®) and Bone Mineral Density Loss

CMAJ 2005;172:746

Extended use (up to 5 yr) of medroxyprogesterone acetate has been found to decrease spine and hip bone mineral density (BMD) by 4% to 6.9%. 2 yr after discontinuation, only partial recovery of BMD has been noted.

### Canadian Consensus Guideline on Continuous and Extended Hormonal Contraception

J Obstet Gyn Canada 2007;29:S1-S2

#### Definitions

- **Extended Use:** The use of combined hormonal contraceptives with planned hormone-free intervals.
- **Continuous Use:** Uninterrupted use of combined hormonal contraceptives without hormone-free intervals.

#### What can be used?

Oral, transdermal and vaginally administered combined hormonal contraceptives, including those originally designed for cyclic use, can be administered in a variety of Continuous and Extended (C/E) regimens.

#### Efficacy and Adherence

Continuous combined hormonal contraceptive regimens are as effective as cyclic regimens in preventing pregnancy. Use of C/E combined hormonal contraceptives may be more "forgiving" about missed doses because of the absence of a hormone-free interval.

#### Side Effects

The side effect profile of C/E combined hormonal contraceptive regimens is not worse than with cyclic regimens, and may even be improved.

#### Medical/Non-contraceptive Usage

For women in the perimenopausal transition who may be ovulating, C/E combined hormonal contraceptive is preferred to hormonal replacement therapy for controlling problematic bleeding and vasomotor symptoms.

### Assessing the Risk of Venous Thromboembolic Events in Women Taking Progestin-Only Contraception: A Meta-Analysis

BMJ 2012;345:e4944

Published online 2012 August 7. doi: 10.1136/bmj.e4944

**Study:** Systematic review and meta-analysis of RCTs and observational studies to see if there is an increased risk of VTE on progestin only OCP and if route of administration had any effect.

**Results:** They found 8 observational studies. Across all 8 studies, 147 women had VTEs. The adjusted relative risk of a VTE for users versus non-users of a progestin-only contraceptive was 1.03 (95% CI 0.76 to 1.39).

**Conclusion:** Oral and intrauterine route made no difference. The relative risk of a VTE for users of an injectable progestin versus non-users was 2.67 (1.29 to 5.53).

### New SOGC Recommendations for Depo-Provera® Users

- Inform patients of potential risks and benefits at intervals throughout course of treatment
- Recommend ways to improve bone health such as calcium, vitamin D, weight-bearing exercise, smoking cessation, decreased alcohol and caffeine intake
- There is no evidence to suggest routine BMD testing

SOGC News Release. New recommendations from national ob/gyn society address Depo-Provera®, bone loss. May 2006. [http://www.sogc.org/media/pdf/advisories/dmpa-may2006\\_e.pdf](http://www.sogc.org/media/pdf/advisories/dmpa-may2006_e.pdf)

## Emergency Postcoital Contraception (EPC)

**Table 12. Emergency Contraceptive Methods**

Method	Mechanism of Action	Side Effects	Contraindications
<b>HORMONAL</b>			
<b>Yuzpe Method</b> <ul style="list-style-type: none"> <li>Used within 72 h of unprotected intercourse; limited evidence of benefit up to 5 d</li> <li>Ovral® 2 tablets then repeat in 12 h (ethinyl estradiol 100 µg/levonorgestrel 500 µg)</li> <li>Can substitute with any OCP as long as same dose of estrogen used</li> <li>2% overall risk of pregnancy</li> <li>Efficacy decreased with time (e.g. less effective at 72 h than 24 h)</li> </ul>	<ul style="list-style-type: none"> <li>Unknown; theories include:               <ul style="list-style-type: none"> <li>Suppresses ovulation or causes deficient luteal phase</li> <li>Alters endometrium to prevent implantation</li> <li>Affects sperm/ova transport</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Nausea (due to estrogen; treat with Gravol®)</li> <li>Irregular spotting</li> </ul>	<ul style="list-style-type: none"> <li>Pre-existing pregnancy (although not teratogenic)</li> <li>Caution in women with contraindications to OCP (although NO absolute contraindications)</li> </ul>
<b>"Plan B"</b> <ul style="list-style-type: none"> <li>Consists of levonorgestrel 750 µg q12h for 2 doses (can also take 2 doses together); taken within 72 h of intercourse</li> <li>Greater efficacy (75-95% if used within 24 h) and better side effect profile than Yuzpe method but efficacy decreases with time; 1st line if &gt;24 h</li> <li>No estrogen thus very few contraindications/side effects (less nausea)</li> </ul>			
<b>NON-HORMONAL</b>			
<b>Postcoital IUD (Copper)</b> <ul style="list-style-type: none"> <li>Insert up to 7 d postcoitus</li> <li>Prevents implantation</li> <li>1% failure rate</li> <li>Can use for short duration in higher risk individuals</li> <li>Mirena® IUD cannot be used as EPC</li> </ul>	• See Table 11	• See Table 11	• See Table 11

### Follow-up

- 3-4 wk post treatment to confirm efficacy (confirmed by spontaneous menses or pregnancy test)
- contraception counseling

Any OCP can be used as EPC; 100 µg ethinyl estradiol PO q12h x 2 doses.

- Levonorgestrel emergency contraception regimens are more effective and cause fewer side effects than the Yuzpe regimen
- Levonorgestrel emergency contraception single dose (1.5 mg) and the 2-dose levonorgestrel regimen (0.75 mg 12 h apart) have similar efficacy with no difference in side effects

SOGC Clinical Practice Guidelines: Emergency Contraception. *JOGC* 2012;34:870-878.  
[http://www.sogc.org/guidelines/documents/gui280CPG1209E\\_000.pdf](http://www.sogc.org/guidelines/documents/gui280CPG1209E_000.pdf)

## Infertility

### Epidemiology

- 10-15% of couples
- must investigate both members of the couple

## Female Factors

### Etiology

- ovulatory dysfunction (15-20%)
  - hypothalamic (hypothalamic amenorrhea)
  - pituitary (prolactinoma, hypopituitarism)
  - ovarian
    - PCOS
    - premature ovarian failure
    - luteal phase defect (poor follicle production, premature corpus luteum failure, failed uterine lining response to progesterone), poorly understood
  - systemic diseases (thyroid, Cushing's syndrome, renal/hepatic failure)
  - congenital (Turner's syndrome, gonadal dysgenesis or gonadotropin deficiency)
  - stress, poor nutrition, excessive exercise (even with presence of menstruation)
- outflow tract abnormality (15-20%)
  - tubal factors (20-30%)
    - PID
    - adhesions (previous surgery, peritonitis, endometriosis)
    - ligation/occlusion (e.g. previous ectopic pregnancy)
  - uterine factors (<5%)
    - congenital anomalies, bicornuate uterus, septate uterus, prenatal DES exposure
    - intrauterine adhesions (e.g. Asherman's syndrome)
    - infection (endometritis, pelvic TB)
    - fibroids/polyps (particularly intrauterine)
    - endometrial ablation
  - cervical factors (5%)
    - hostile or acidic cervical mucus
    - anti-sperm antibodies
    - structural defects (cone biopsies, laser or cryotherapy)

**Infertility:** inability to conceive or carry to term a pregnancy after one year of regular, unprotected intercourse.

**Primary infertility:** infertility in the context of no prior pregnancies.

**Secondary infertility:** infertility in the context of a prior conception.

Generally, 75% of couples achieve pregnancy within 6 mo, 85% within 1 yr, 90% within 2 yr.

### Requirements for Conception

- Ovary
- Tube
- Cervix
- Endometrium
- Sperm

- endometriosis (15-30%)
- multiple factors (30%), see GY22
- unknown factors (10-15%)

### Investigations

- ovulatory
  - day 3: FSH, LH, TSH, prolactin  $\pm$  DHEA, free testosterone (if hirsute)
  - day 21-23: serum progesterone to confirm ovulation
  - initiate basal body temperature monitoring (biphasic pattern)
  - postcoital test: evaluate mucus for clarity, pH, spinnbarkeit/fibrosity (rarely done)
- tubal factors
  - HSG (can be therapeutic – opens fallopian tube)
  - SHG (can be therapeutic – opens fallopian tube)
  - laparoscopy with dye insufflation (or tubal dye test)
- peritoneal/uterine factors
  - HSG/SHG, hysteroscopy
- other
  - karyotype

### Treatment

- education: timing of intercourse in relation to ovulation (from 2 d prior to 2 d following presumed ovulation), every other day
- medical
  - ovulation induction
    - ♦ clomiphene citrate (Clomid<sup>®</sup>): estrogen antagonist that causes a perceived decreased estrogen state, resulting in increased pituitary gonadotropins; causes increased FSH and LH, leading to ovulation induction (works much better if anovulatory)
    - ♦ human menopausal gonadotropin – HMG (Pergonal<sup>®</sup>), urofollitropin – FSH (Metrodin<sup>®</sup>) – FSH and LH extracted from urine of postmenopausal women
    - ♦ followed by  $\beta$ -hCG for stimulation of ovum release
  - may add
    - ♦ bromocriptine (dopamine agonist) if elevated prolactin
    - ♦ dexamethasone for hyperandrogenism (adult onset congenital adrenal hyperplasia)
    - ♦ metformin (for PCOS)
    - ♦ luteal phase progesterone supplementation for luteal phase defect (mechanism not completely understood)
    - ♦ ASA (81 mg PO OD) for women with a history of recurrent spontaneous abortions (for antiphospholipid antibody syndrome)
- surgical/procedural
  - tubuloplasty
  - lysis of adhesions
  - artificial insemination: intracervical insemination (ICI), intrauterine insemination (IUI), intrauterine tuboperitoneal insemination (IUTPI), intratubal insemination (ITI)
  - sperm washing
  - IVF (in vitro fertilization)
  - IFT (intrafallopian transfer)
  - GIFT\* (gamete intrafallopian transfer): immediate transfer with sperm after oocyte retrieval
  - ZIFT\* (zygote intrafallopian transfer): transfer after 24 h culture of oocyte and sperm
  - TET\* (tubal embryo transfer): transfer after >24 h culture
  - ICSI (intracytoplasmic sperm injection)
  - IVM (in vitro maturation)
  - $\pm$  oocyte or sperm donors
  - $\pm$  pre-genetic screening for single gene defects in karyotype of zygote
  - \*Not performed in Canada

#### When Should Investigations Begin?

- <35 yr: after 1 yr of regular unprotected intercourse
- 35-40 yr: after >6 mo
- >40 yr: immediately
- Earlier if:
  - History of PID
  - History of infertility in previous relationship
  - Prior pelvic surgery
  - Chemotherapy/radiation in either partner
  - Recurrent pregnancy loss
  - Moderate-severe endometriosis

#### Controversial and Evolving Ethical Issues

- Infertility demands non-judgmental discussion
- Ethical issues surrounding therapeutic donor insemination in same sex couples, surrogacy, donor gametes and other advanced reproductive technologies are still evolving and remain controversial
- If the doctor finds that certain treatment options lie outside of their moral boundaries, the infertile couple should be referred to another physician

#### Summary of Current Legislation in Canada

##### Bill C-13 Assisted Human Reproduction Act 2004:

What is not allowed

- Cloning people
- Cloning stem cells
- Growing human embryos for research
- Sex selection
- Making changes to human DNA that would pass from one generation to the rest
- Creating people who have animal DNA
- Buying or selling embryos, sperm, eggs or other human reproductive material

What is allowed

- Surrogate mothers
- Donating sperm, eggs and other reproductive material
- Using embryos, sperm, eggs, etc., to assist conception
- Using human embryos and stem cells in research
- Sex selection in X-linked genetic diseases

#### Normal Semen Analysis (WHO lower reference limits)

- Must be obtained after 2-7 d of abstinence
  - Volume 1.5 cc
  - Count 15 million/cc
  - Vitality 58% live
  - Motility 32% progressive, 40% total (progressive + non-progressive)
  - Morphology 4.0% normal

## Male Factors

- see [Urology](#), U33

### Etiology

- varicocele (>40%)
- idiopathic (>20%)
- obstruction (~15%)
- cryptorchidism (~8%)
- immunologic (~3%)

### Investigations

- semen analysis and culture
- post-coital (Huhner) test: rarely done

# Gynecological Infections

## Physiologic Discharge

- clear, white, flocculent, odourless discharge; pH 3.8-4.2
- smear contains epithelial cells, *Lactobacilli*
- increases with increased estrogen states: pregnancy, OCP, mid-cycle, PCOS or premenarchal
- if increased in perimenopausal/postmenopausal woman, consider investigation for other effects of excess estrogen (e.g. endometrial cancer)

## Vulvovaginitis

### PREPUBERTAL VULVOVAGINITIS

- clinical features
  - irritation, pruritus
  - discharge
  - vulvar erythema
  - vaginal bleeding (specifically due to Group A *Streptococci* and *Shigella*)
- differential diagnosis
  - non-specific vulvovaginitis (25-75%)
  - infections (respiratory, enteric, systemic, sexually acquired)
  - foreign body (toilet paper most common)
  - *Candida* (if using diapers)
  - pinworms
  - polyps, tumour (ovarian malignancy)
  - vulvar skin disease (lichen sclerosis, condyloma acuminata)
  - trauma (accidental straddle injury, sexual abuse)
  - psychosomatic vaginal complaints (specific to vaginal discharge)
  - endocrine abnormalities (specific to vaginal bleeding)
  - blood dyscrasia (specific to vaginal bleeding)
- etiology
  - infectious:
    - ♦ poor hygiene, proximity of vagina to anus
    - ♦ recent infection (respiratory, enteric, systemic)
    - ♦ STI: investigate sexual abuse
  - nonspecific:
    - ♦ lack of protective hair and labial fat pads
    - ♦ lack of estrogenization
    - ♦ susceptible to chemicals, soaps (bubble baths), medications and clothing
    - ♦ enuresis
- investigations
  - vaginal swab for culture (specifically state that it is a pre-pubertal specimen)
- treatment
  - enhanced hygiene and local measures (handwashing, white cotton underwear, no nylon tights, no tight fitting clothes, no sleeper pajamas, sitz baths, avoid bubble baths, use mild detergent, eliminate fabric softener, avoid prolonged exposure to wet bathing suits, urination with legs spread apart)
  - A&D® dermatological ointment (vitamin A/D) to protect vulvar skin
  - infectious: treat with antibiotics for organism identified

#### Vulvovaginitis

Vulvar and vaginal inflammation.

Most common gynecological problem in prepubertal girls is non-specific vulvovaginitis, not yeast!

There is no high quality evidence showing a link between vulvovaginal candidiasis and hygienic habits or wearing tight or synthetic clothing.

#### Prepubertal and Adolescent Gynecological Infections: Legal Aspects of Confidentiality

- Clinicians who treat adolescents must be aware of federal, state and provincial laws related to adolescent consent and confidentiality
- They must be aware of guidelines governing funding sources for particular services and be familiar with the consent and confidentiality policies of the facility in which they practice

**Table 13. Other Common Causes of Vulvovaginitis in Prepubertal Girls**

	Pinworms	Lichen Sclerosis	Foreign Body
<b>Diagnosis</b>	Cellophane tape test	Area of white patches and thinning of skin	
<b>Treatment</b>	Empirical treatment with mebendazole	Topical steroid creams	Irrigation of vagina with saline, may require local anesthesia or an exam under anesthesia

**POSTMENOPAUSAL VAGINITIS/ATROPHIC VAGINITIS**

- clinical features
  - dyspareunia
  - post-coital spotting
  - mild pruritus
- investigations
  - atrophy is usually a visual diagnosis: thinning of tissues, erythema, petechiae, bleeding points, dryness on speculum exam
  - rule out malignancy: especially endometrial cancer
- treatment
  - local estrogen replacement (ideal): Premarin® cream, VagiFem® tablets, or Estring®
  - oral or transdermal hormone replacement therapy (if treatment for systemic symptoms is desired)
  - good hygiene

**INFECTIOUS VULVOVAGINITIS****Table 14. Infectious Vulvovaginitis**

	<b>Candidiasis (Moniliasis)</b>	<b>Bacterial Vaginosis (BV)</b>	<b>Trichomoniasis</b>
<b>Organisms</b>	<i>Candida albicans</i> (90%) <i>Candida glabrata</i> (<5%) <i>Candida tropicalis</i> (<5%)	<i>Gardnerella vaginalis</i> <i>Mycoplasma hominis</i> Anaerobes: <i>Prevotella</i> , <i>Mobiluncus</i> , <i>Bacteroides</i>	<i>Trichomonas vaginalis</i> (flagellated protozoan)
<b>Pathophysiology or Transmission</b>	Predisposing factors include: • Immunosuppressed host (diabetes, AIDS, etc.) • Recent antibiotic use • Increased estrogen levels (e.g. pregnancy, OCP)	Replacement of vaginal <i>Lactobacillus</i> with organisms above	Sexual transmission
<b>Discharge</b>	Whitish, "cottage cheese," minimal	Grey, thin, diffuse	Yellow-green, malodorous, diffuse, frothy
<b>Other</b>	• 20% asymptomatic	• 50-75% asymptomatic	• 25% asymptomatic
<b>Signs/Symptoms</b>	• Intense pruritus • Swollen, inflamed genitals • Vulvar burning, dysuria, dyspareunia	• Fishy odour, esp. after coitus • Absence of vulvar/vaginal irritation	• Petechiae on vagina and cervix • Occasionally irritated tender vulva • Dysuria, frequency
<b>pH</b>	≤4.5	≥4.5	≥4.5
<b>Saline Wetmount</b>	KOH wetmount reveals hyphae and spores	• >20% clue cells = squamous epithelial cells dotted with coccobacilli ( <i>Gardnerella</i> ) • Paucity of WBC • Paucity of <i>Lactobacilli</i> • Positive whiff test: fishy odour with addition of KOH to slide (due to formation of amines)	• Motile flagellated organisms • Many WBC • Inflammatory cells (PMNs)
<b>Treatment</b>	• Clotrimazole, butoconazole, miconazole, terconazole suppositories and/or creams for 1, 3 or 7 d treatments • Treatment in pregnancy is usually topical • Fluconazole 150 mg PO in single dose (can be used in pregnancy)	• No treatment if non-pregnant and asymptomatic, unless scheduled for pelvic surgery or procedure • Oral • Metronidazole 500 mg PO bid x 7 d • Topical • Metronidazole gel 0.75% x 5 d OD (may be used in pregnancy) • Clindamycin 2% 5 g intravaginally at bedtime for 7 d	• Treat even if asymptomatic • Metronidazole 2 g PO single dose or 500 mg bid x 7 d (alternative) • Symptomatic pregnant women should be treated with 2 g metronidazole once
<b>Other</b>	• Prophylaxis for recurrent infection includes boric acid, vaginal suppositories, luteal phase fluconazole • Routine treatment of partner(s) not recommended (not sexually transmitted)	• Associated with recurrent preterm labour, preterm birth and postpartum endometritis • Need to warn patients on metronidazole not to consume alcohol (disulfiram-like action) • Routine treatment of partner(s) not recommended (not sexually transmitted)	• Warnings accompanying metronidazole use • Treat partner(s)

## Sexually Transmitted Infections (STIs)

- see [Family Medicine](#), FM46

Figure 12. Speculum exam

### TRICHOMONIASIS

- see *Infectious Vulvovaginitis*, Table 14, GY25

### CHLAMYDIA

#### Etiology

- *Chlamydia trachomatis*

#### Epidemiology

- most common bacterial STI in Canada
- often associated with *N. gonorrhoeae*

#### Clinical Features

- asymptomatic (80% of women)
- muco-purulent endocervical discharge
- urethral syndrome: dysuria, frequency, pyuria, no bacteria on culture
- pelvic pain
- post-coital bleeding or intermenstrual bleeding (particularly if on OCP and prior history of good cycle control)
- symptomatic sexual partner

#### Investigations

- cervical culture or nucleic acid amplification test
- obligate intracellular parasite: tissue culture is the definitive standard
- urine and vaginal tests now available, which are equally or more effective than cervical culture

#### Treatment

- doxycycline 100 mg PO bid for 7d or azithromycin 1 g PO in a single dose (may use in pregnancy)
- also treat gonorrhea because of high rate of co-infection
- treat partners
- reportable disease
- test of cure for chlamydia required in pregnancy (cure rates lower in pregnant patients) → retest 3-4 wk after initiation of therapy

#### Screening

- high risk groups
- during pregnancy
- with initiation of OCP (independent risk factor)

#### STI Testing

- Vaginal swab
  - Tests for bacterial vaginosis, trichomoniasis, candida
- Cervical swab
  - Tests for gonorrhea and chlamydia

#### Risk Factors for STIs

- History of previous STI
- Contact with infected person
- Sexually active individual < 25 yr
- Multiple partners
- New partner in last 3 mo
- Lack of barrier protection use
- Street involvement (homelessness, drug use)

#### Public Health Agency of Canada: National Reportable STIs

- Chlamydia
- Gonorrhea
- Hepatitis A, B, C
- HIV
- Syphilis

## Complications

- acute salpingitis, PID
- Fitz-Hugh-Curtis syndrome (liver capsule inflammation)
- reactive arthritis (male predominance, HLA-B27 associated), conjunctivitis, urethritis
- infertility: tubal obstruction from low grade salpingitis
- ectopic pregnancy
- chronic pelvic pain
- perinatal infection: conjunctivitis, pneumonia

## GONORRHEA

### Etiology

- *Neisseria gonorrhoeae*
- symptoms and risk factors same as with chlamydia

### Investigations

- Gram stain shows Gram-negative intracellular diplococci
- cervical, rectal and throat culture (if clinically indicated)

### Treatment

- single dose of ceftriaxone 250 mg IM, or cefixime 800 mg PO
- if pregnant: above regimen or 2 g spectinomycin IM (avoid quinolones)
- also treat chlamydia, because of high rate of co-infection
- treat partners
- reportable disease
- screening as with Chlamydia

## HUMAN PAPILLOMAVIRUS (HPV)

### Etiology

- most common viral STI in Canada
- >200 subtypes, of which >30 are genital subtypes
- HPV types 6 and 11 are classically associated with anogenital warts/condylomata acuminata
- HPV types 16 and 18 are the most oncogenic (classically associated with cervical HSIL)
- types 16, 18, 31, 33, 35, 36, 45 (and others) associated with increased incidence of cervical and vulvar intraepithelial hyperplasia and carcinoma

### Clinical Features

- latent infection
  - no visible lesions, asymptomatic
  - only detected by DNA hybridization tests
- subclinical infection
  - visible lesion found during colposcopy or on Pap test
- clinical infection
  - visible wart-like lesion without magnification
  - hyperkeratotic, verrucous or flat, macular lesions
  - vulvar edema

### Investigations

- cytology (see *Cervical Screening Pap Test*, GY43)
  - koilocytosis: nuclear enlargement and atypia with perinuclear halo
- biopsy of lesions at colposcopy
